" It was my fixed purpose, when I left Macao, to afford every reasonable satisfaction " concerning the immediate withdrawal of this property, unquestionably drawn here by " a long course of encouragement on the part of this Government, and either to cause " the merchants of my country in trade at Canton, to make solemn promises that they " would abstain from connexion with the opium traffic in future, or myself, on the part of " Her Majesty's Government, to undertake that no reclamation should be made, if they " were forthwith expelled."

The proceedings of the Imperial Commissioner, however, compelled him to abandon all hope of effecting any settlement of the question by the means which he had contemplated.

" His purposes," he wrote, " were plain; and it was my clear duty to let them reach " me, and not the merchants, acting principally for absent men, and therefore wholly " incapable of taking consentaneous courses, or any other than those which would lead " to separate and ruinous surrenders of all this immense mass of property." "The " surrender," he continued " of the property at the first public summons was founded " upon the clear perception that the demand without alternative of any kind, under " the circumstances of strictest and most unprovoked restraint, faithfully described " in my public notice, was an act of forcible spoliation of the very worst description, " justly leaving to Her Majesty the right of full indemnity and future security."

" The situation of this peculiar property has been entirely altered by the High " Commissioner's proceedings; and his continuance of the state of restraint, insult, and " dark intimidation, subsequently to the surrender, has certainly classed the whole case " amongst the most shameless violences which one nation has ever yet dared to " perpetrate against another.

" It is not by measures of this kind that the Chinese Government can hope to put " down a trade which every friend to humanity must deplore; great moral changes can " never be effected by the violation of all the principles of justice and moderation. The " wise course would have been to make the trade shameful, and wear it out by degrees " in its present form. The course taken will change the manner of its pursuit at once, " cast it into desperate hands, and with this long line of unprotected coast, abounding " in safe anchorages, and covered with defenceless cities, I foresee a state of things " terrible to reflect upon.

" Perhaps, indeed, the chief mischief of the actual proceedings is the evil feeling of " revenge they will unquestionably produce in the minds of the class of men, otherwise " disposed to engage in the traffic for the mere love of gain; they will seem to justify " in the consciences of such persons, every species of retaliation. Indeed, I feel, " assured that the single mode of saving the coasts of the Empire from a shocking " character of warfare, both foreign and domestic, will be the very prompt and powerful " interference of Her Majesty's Government for the just vindication of all wrongs, and " the effectual prevention of crime and wretchedness by permanent settlement."

Writing some days later, on the 22nd April, Captain Elliot expressed a confident opinion that the Chinese Government was itself prepared to make some reparation for the forcible confiscation of property, which had been effected; and suggested that the opium surrendered might possibly be made the means of defraying an indemnity. "In my "judgment," he wrote, "the main body of this opium, in fact, all that is saleable, will "be turned to the most advantageous account; I confess I have a suspicion that the "present spoliatory measures will end in the legalization of the trade, upon the footing of "a Government monopoly, with probably some provision for the cessation of imports for "one year, and perhaps a limited and annually decreasing amount after the expiration "of that period. . . . However, without prolonging this course of specu-"lation, I may say that there is no doubt at all of the intention to pay something by "some means.

"Let Her Majesty's Government then think fit to respond to these tidings with "an immediate and strong declaration that it will exact complete indemnity for all "manner of loss; and I am well assured that such a communication alone will so hasten "the purposes of the Chinese Government, and so extend the measure of remuneration "(certainly already intended), that there will be nothing to seek for under that head by "the time that force can reach these coasts. The demand of all others which the "Chinese would least wish to meet at such a moment is one involving money "payment."

The delivery of the 20,283 chests of opium, much of which was not at Lintin, but had been sent for sale along the coast, occupied Mr. Johnston, the Deputy Superintendent, for a considerable time.

Letter from Captain Elliot to Mr. Backhouse dated 3rd July 1839, and Enclosures; pages 5-7 of additional papers (12 pages).

The merchants and their agents surrendered the full quantities of opium, specified in their replies to Captain Elliot's notice of the 27th March, with the exception of two Parsees, whose deliveries were for some reason short of the proper amount by $523\frac{68}{100}$ chests. The opportune arrival of a ship with opium from India, consigned to Messrs. Dent and Company, enabled Captain Elliot to fulfil his obligations; and the firm, at his request, supplied, under a promise of indemnification, the opium required to make good the deficiency. The other opium ships from India remained at Singapore to await the result of the Imperial Commissioner's proceedings, and the arrival of the ship was a fortunate coincidence. Whether the agents of the defaulters sold the opium in ignorance of the arrangements made for its surrender, is not clear; but several of the opium traders were at Macao, and the traffic in the drug does not appear to have been entirely stopped even during the continuance of the Commissioner's violent proceedings.

Enclosure 10 in the letter from Captain Elliot to Lord Palmerston, commenced April the 6th, and finished May the 4th, 1839; pages 399 and 400 of the correspondence.

On the 19th April the Commissioner and Governor issued an edict to Captain Elliot direct, informing him that four of the receiving-ships, which had arrived at the delivering-station on the 18th, had apparently disposed of a considerable portion of their cargoes, and that a Chinese smuggler, who had been apprehended by a preventive boat in the act of selling opium, had admitted, upon examination, that he had purchased the opium on board a foreign vessel on the 10th April. They ordered him therefore to give instructions to Mr. Johnston to bring the remaining receiving-ships at once to the appointed anchorage, and "to restrain the people and seamen of the vessels from "diminishing in the least degree the amount of opium." "The said Superintendent," they wrote, "must not presume on his having at first reported a certain full amount "to let them clandestinely dispose of any quantities, there may be in excess, thereby "occasioning a return of the pervading poison, and so drawing on himself criminality "and cause of sorrow. Tremblingly consider this."

Enclosure 11 in the same letter; page 400 of the correspondence.

Captain Elliot issued orders, as directed, to Mr. Johnston; but pointed out that the business was extensive, and that many persons of low degree were concerned in it, so that it was difficult to entirely prevent irregularities of the nature complained of, while he personally, owing to his confinement at Canton, was unable to exercise any supervision. "When the communications are constantly open," he wrote, "Elliot "will himself be enabled to exercise a more vigilant control. In all his proceedings "he has manifested truth and sincerity, and Your Excellencies will find that to repose "entire confidence in him, so that he may act with effect, is the surest mode of "completing the whole delivery of 20,283 chests, and preventing future irregularity. "Much disorder will always take place when the chief authority cannot exercise "constant control."

This explanation was apparently accepted; and although free communication was not permitted, no further complaints were made regarding the manner in which the delivery of the opium was effected.

Commissioner Lin, who had shown his mendacity by the assertion that the foreigners had only been shut up in Canton in consequence of Captain Elliot's arrival

and attempt to escape with Mr. Dent, did not adhere at all closely to his own promises. In Captain Elliot's words:—"The servants were not faithfully restored when one "fourth of the opium was delivered: the boats were not permitted to run when one-"half was delivered; the trade was not really opened when three-fourths were "delivered; and the last pledge, that things should go on as usual when the whole "was delivered *was* falsified by the reduction of the factories to a prison with one "outlet,—the expulsion of 16 persons, some of them who never dealt in opium at "all, some clerks, one a lad,—and the proposal of novel and intolerable regulations."

Public declaration by Captain Elliot, dated 21st June 1839; Enclosure 1 in a letter from Captain Elliot to Lord Palmerston, dated 17th Nov. 1839; pages 37 and 38 of additional papers. (52 pages).

In the terms which he fixed on the 2nd April, for the withdrawal of all restrictions upon the liberty of the foreigners and for the resumption of trade, the Commissioner said nothing about bonds. As soon, however as the delivery of the opium had been arranged for, he brought forward the question, which was (it must be said) distinctly mooted in his proclamation to the foreigners of the 18th March. On the 4th April, the day following Mr. Johnston's departure, the two senior Hong merchants were deputed to suggest to Captain Elliot, that he and the merchants of the British nation and its dependencies should sign a bond, binding themselves, to "plainly address" Her Majesty the Queen, so that orders might be issued prohibiting the manufacture of opium and the exportation of it to China, and to agree in their own behalf and on behalf of their countrymen to a penalty of confiscation and death in the event of any transgression of the prohibition issued by the Chinese Government against the introduction of opium. The clause containing this drastic proviso was as follows:—"From the commencement of autumn in this "present year any merchant vessel coming to Kwangtung that may be found to "bring opium shall be immediately and entirely confiscated, both vessel and cargo, "to the use of Government; no trade shall be allowed to it, and the parties shall "be left to suffer death at the hands of the Celestial Court; such punishment "they will readily submit to."

Letter from Captain Elliot to Lord Palmerston, commenced on the 6th April, and finished on the 4th May 1839; pages 385-391; and Enclosure 1 in the same letter; pages 391 and 392 of the correspondence.

Several of the foreign merchants of all nations had, it may be noticed, replied on the 25th March to the Commissioner's proclamation of the 18th, pledging themselves, as individuals, neither to deal in opium, nor import it into China, but pointing out that questions, affecting national interests, could only be settled by the representatives of their respective nations; but the Commissioner took no notice of the communication.

Enclosure 7 in the same letter; pages 397 and 398 of the correspondence.

Captain Elliot, who was evidently taken aback by this demand, returned the draft of the proposed bond to the merchants, and sent no reply to an order, which he received on the following day, from the City Governor, directing him to require all the foreigners to execute bonds at once. On the 6th April, however, the Imperial Commissioner issued commands to him direct, commending his conduct in regard to the surrender of the opium, and ordering him to arrange for the execution of the bonds required by all British subjects at Canton.

Letter from Captain Elliot to Lord Palmerston; pages 385-391 of the correspondence.

Enclosure 3 in the same letter; pages 393 and 394 of the correspondence.

Captain Elliot replied on the 8th April that he was unable consistently with the laws of his country to require the execution of any such instruments. "The bonds," he said, "have relation to the future, and would involve terrible responsibilities in any "possible case of disobedience to the prohibitions. They would involve, too, not alone "parties themselves, but others also. Such bonds it is impossible even for his "honoured Sovereign to require; and how much more must it be out of the power of "Elliot himself to require them."

Enclosure 4 in the same letter; page 394 of the correspondence.

Further correspondence ensued, but Captain Elliot was firm in his refusal, and, on the 20th April, he tore up in the presence of the Hong merchants a direct communication from the Imperial Commissioner and Governor, which they had been ordered to deliver, reiterating the demand for the execution of the bonds; and desired the merchants to inform the Commissioner and Governor, "that they might take *his* life as "soon as they saw fit; but that it was a vain thing to trouble themselves or *him* any "further on the subject."

Letter from Captain Elliot to Lord Palmerston; pages 385-391; and Enclosures 5 and 6; pages 395-397.

"Elliot," he wrote, in reply to the Commissioner and Governor, on the 20th April, "has been appointed by his Government for the special purpose of superintending the "people of his country resorting hither for trade. But finding now that the high "officers absolutely require compliance with new regulations and terms, which they "have fixed for the trade of his country with China, and these being such as it is "impossible for him to consent to, he has therefore the honour to request that he may "be enabled, at the head of the men and ships of his country, to take his departure "and sail away. Elliot still most faithfully pledges himself to deliver up to the high "officers all the opium which he lately took from the English people in Her Majesty's "name."

Enclosure 12 in the same letter; page 401 of the correspondence.

This reply, and the message sent through the Hong merchants, apparently convinced the Imperial Commissioner that Captain Elliot was determined not to yield the point, and the demand was accordingly dropped for the time.

The Americans and other European traders to Canton were also required to execute similar bonds; and although the Consuls at first objected, the Americans at any rate eventually yielded and complied with the requisition.

Letter from Captain Elliot to the Portuguese Governor of Macao, dated 13th April 1839; pages 406 and 407 of the correspondence.

The proceedings of the Imperial Commissioner soon satisfied Captain Elliot, that there was no hope of the peaceful re-establishment of British commerce at Canton upon any reasonable footing, and on the 13th April he contrived with some difficulty to send a letter to the Governor of Macao, in which he placed himself and all Her Britannic Majesty's subjects, ships, and property under the protection of the Portuguese Government, and offered assistance, both in men and money, to place the settlement and harbour in a state of defence, and to equip a sufficient number of armed vessels to keep the coast clear from the Chinese.

Letter from CaptainElliot to Lord Auckland, Governor-General of India dated 16th April 1839; pages 408 and 409 of the correspondence.

On the 16th April also he wrote to the Governor General of India, informing him of the recent occurrences at Canton, and of the offer to co-operate in the defence of Macao which he had made to the Portuguese Governor, and applying for the immediate despatch from India of as many ships of war and armed vessels as could be spared, for the protection of the life and property of British subjects in China.

Letter from the Portuguese Governor to Captain Elliot, dated 15th April 1839: page 408 of the correspondence.

The Portuguese Governor was unwilling to commit himself with the Chinese Government, by accepting assistance for the defence of the settlement without more satisfactory proof of its necessity; and on the 15th April he replied to Captain Elliot, declining politely his offer of co-operation, on the ground that he was bound to maintain a strict neutrality, but repeating the assurance, which he had given on the 22nd March, to the effect that he would protect, as far as he was able, the lives and property of British subjects in Macao as long as they were not engaged in any contraband traffic.

Letter from Captain Elliot to Lord Palmerston, dated 6th May 1839; pages 405 and 406 of the correspondence; and evidence of Mr. Matheson before the Select Committee of the House of Commons on the Chinese Trade in 1840.

The Portuguese took advantage of the pre-occupation of the Imperial Commissioner at Canton to send away their opium, of which they possessed about 2,000 chests, to Manilla; and when his attention was turned to Macao, they were able to satisfy him by executing bonds, binding themselves to bring no more opium into the settlement. The opium sent to Manilla was said to have been subsequently sold at a large profit on the east coast of China.

Order by the Prefect or City Governor of Canton and other magistrates to Captain Elliot, dated 4th May 1894; pages 401–403 of the correspondence.

By the 4th May, the greater part of the 20,283 chests of opium owned by British subjects had been surrendered; and the Imperial Commissioner and Governor of Canton directed that the blockading vessels, and the guards stationed at the factories, should be removed, and that boats, registered as "obedient" should be allowed, subject to examination by officers deputed for the purpose, to pass to and fro between Canton and Whampoa; and issued orders, permitting Captain Elliot and other foreigners to leave Canton, with the exception of 16 persons, who were said to have been for a long time habitual traders in opium, and who therefore were detained. Merchant ships at Whampoa were allowed to trade and to leave the port; but ships which had arrived in the course of the proceedings and were then in the "outer-seas," were required to remain there, pending settlement of the business in hand, and were not permitted to enter the port.

Public notice by Captain Elliot to British subjects, dated 4th May 1839; page 403 of the correspondence.

Captain Elliot, on receipt of these orders, drew the attention of British subjects to the notice, which he had issued on the 23rd March, advising them to proceed with their property to Macao, but announced his intention of remaining at Canton until he had fulfilled completely his obligations to the Chinese Government.

Letter from Captain Elliot to Lord Palmerston, dated 6th May 1839; pages 405 and 406 of the correspondence.

On the 6th May also he wrote to Lord Palmerston, informing him of the rumoured intention of the Imperial Commissioner to occupy Macao with Chinese troops, and recommending that an arrangement should be effected with the Government of Portugal for the cession of the settlement to the British Government, or for its effectual defence by British arms, and "appropriation to British uses." "The "safety of Macao," he wrote, "is, in point of fact, an object of secondary moment to "the Portuguese Government; but to that of Her Majesty it may be said to be of "indispensable necessity, and most particularly at this moment."

Enclosures 2–5 in a letter from Captain Elliot to Lord Palmerston, commenced on the 18th and finished on the 29th May 1839; pages 412–415 of the correspondence.

On the 8th May the City Governor, under the direction of the Imperial Commissioner and Governor of Canton, ordered Captain Elliot to expel Mr. Innes from the Chinese Empire, as a seizure of opium made by the Portuguese at Macao showed that he was unmindful of the lenity that had been shown to him, and was still engaged in smuggling.

Captain Elliot considered that the demand for Mr. Innes' expulsion was justified by the circumstances; and on the 9th May he submitted an address to the Commissioner and Governor informing them of his intention to require him to depart forthwith.

He then on the same day issued an order charging Mr. Innes by his duty to the Queen to leave China as soon as possible, and wrote to the Portuguese Governor, requesting him to withdraw his protection, and to require Mr. Innes to leave Macao within 24 hours.

Letter from Captain Elliot to Lord Palmerston, dated 14th June 1839, and enclosures; pages 420-427 of the correspondence.

This order led to a sharp controversy between Captain Elliot and Mr. Innes, which need only be briefly referred to. Mr. Innes did not deny that he had continued to sell opium at Macao up to the 11th April, but disputed the accuracy of the facts as stated by the Chinese, and protested strongly against the order which Captain Elliot had issued for his expulsion, urging that, although he did not expect protection from the British Government for any loss or inconvenience he might sustain in the course of his contraband dealings, the Superintendent had no right to use his influence to assist the Chinese, and bring pressure to bear upon the Portuguese Governor. Captain Elliot, however, would not withdraw his order; and Mr. Innes was compelled to leave Macao. On the 8th June 1839, he submitted a petition from Macao roads to Her Majesty the Queen in Council, on the subject of Captain Elliot's proceedings, which contained a remarkable account of the manner in which he had carried on his business in opium in China.

"That your petitioner," he wrote, "has been 13 years resident in China, during "which period he has traded considerably in opium, which traffic has been likewise "followed by at least nine-tenths of your Majesty's subjects resorting to China. That "your petitioner in the above period has sold opium to the licensed Hong merchants, "and has delivered opium to the boats of His Excellency the Governor of Canton and "to many other Government officers, &c., &c."

Captain Elliot, it appears, was prepared to arrest Mr. Innes, it a continued defiance, on his part, of the authority of the Chinese Government should endanger the safety of British subjects in China, but the necessity for such a measure did not arise; and whether Mr. Innes left China, or conducted his business in the future with greater caution and moderation, the incident, so far as it affected the relations between the Chinese and the British Government, was closed by the issue of Captain Elliot's orders of May 9th, and by the expulsion of Mr. Innes from Macao.

Public notice by Captain Elliot to British subjects dated 11th May 1839; pages 410 and 411 of the correspondence.

On the 10th May an edict was communicated to Captain Elliot, and to the American and Dutch Consuls, announcing formally the law of the Chinese Empire on the subject of the importation of opium. "By this law," said Captain Elliot, in a notice issued to British subjects, "the ships and crews of all nations, henceforward arriving in China, "are liable to the penalties, the first of confiscation, and the last death, upon the "determination of this Government that they have introduced opium. . . . . It "will be particularly observed that persons remaining are understood by the "Government to assent to the reasonableness of the law."

Letter from Captain Elliot to Lord Palmerston commenced on the 18th and finished on the 29th May 1839; pages 409-411 of the correspondence.

This edict was followed by a series of drastic measures, designed to control and repress the foreigners effectually for the future. A strong paling was constructed round the factories, shutting off the foreigners from access to the river, and leaving open only one avenue of communication with the city, at the head of which a strong guard was posted; the pleasure boats used for excursions on the river were taken away, and a number of intolerable* regulations, which were said by Captain Elliot to be inconsistent with any possibility of carrying on trade at Canton, were introduced. Measures also were taken to prevent entirely all unlicensed trading, and to re-establish in full vigour the Hong monopoly. The houses near the factories of the outside (*i.e.*, unlicensed) merchants and shopkeepers, with whom the foreigners had often extensive dealings, were ordered to be thrown down, and the streets in which these merchants and shopkeepers resided were to be closed and built over.

Orders at the same time were issued for the expulsion from China of six of the sixteen persons detained at Canton as being noted traders in opium, Mr. Dent, four gentlemen connected with the firm of Jardine, Matheson, and Co., and a Parsee.

Letter from Captain Elliot to Lord Palmerston dated 8th July, 1839, and Enclosure 1; pages 427 and 428 of the correspondence.

On the 18th May the delivery of the 20,283 chests of opium was completed by Mr. Johnson, and a formal acknowledgment of receipt was given to him by the City Governor. News of this transaction reached Captain Elliot at Canton on

* One regulation appears to have prescribed the manner in which Chinese trading junks should be built and appointed; and the name of every sailor in a junk was to be written in clear characters upon the sail. (Evidence of Mr. Inglis before the Select Committee of the House of Commons upon the China Trade in 1840. —Q. 621.)

the 21st, and an edict was issued by the Governor soon after, permitting the merchant ships, which had arrived in the "outer-seas," to enter the port, but stating that the regulations, under which the trade was to be conducted, would be announced after their arrival at Whampoa, and requiring the ten remaining proscribed persons to leave China, and to give a promise in writing not to return. The promise was given, by Captain Elliot's advice, on the understanding that the matter should form the subject of special negotiation with the Chinese Government, in the event of any opportunity arising; and the gentlemen in question left Canton, and proceeded to Macao.

Letter from Captain Elliot to Lord Palmerston, commenced on the 18th and finished on the 29th May, 1839; pages 409–411 of the correspondence.

None of the British merchant ships that were in the outer seas entered the port to avail themselves of the Governor's permission to trade, and Captain Elliot, as soon as he heard of the Governor's edict, which was not officially communicated to him, issued a notice to the commanders enjoining them not to enter.

Enclosures 7 and 8 in the above letter; page 417 of the correspondence.

On the 24th May Captain Elliot left Canton for Macao, informing the Governor of his intention, and mentioning the fact that he was in bad health. The Governor, in his reply, showed that he was not insensible to the efforts which Captain Elliot had made to meet the wishes of the Chinese Government. "Before, at the time of "removing the guard," he wrote, "it was directed that the said Superintendent "should leave Canton, in order to conduct the delivery of the opium; but, on the "ground that all the foreigners remaining at Canton still required to be controlled "and restrained, he did not at once prefer his request to depart. At this time, being "in bad health, he has presented his address of leave. It is surely right that he "should be permitted to go to Macao, that he may be enabled to receive medical "treatment.

"At present, although the opium has been all delivered to the amount before "stated, yet the High Commissioner and I, the Governor, have still many matters "regarding which to direct him to act. The Superintendent having a respectful "sense of duty, and being able in action, must hasten to recover his health speedily. "He must not delay, and while he has been ready at the first, be found lacking at the "last.

"Let him also, on his arrival at Macao, faithfully and truly examine, and, if the "foreigners, of every nation, residing at Macao are guilty of secreting any opium, "he must instantly command them, one and all, to deliver up the entire quantity."

Memorial from British subjects to Lord Palmerston, dated 23rd May 1839; pages 418–420 of the correspondence.

The British merchants in China followed Captain Elliot's advice and example, and withdrew in a body to Macao. Before leaving Canton, Dent & Co., and other English firms, and a number of Parsees, submitted a temperate and well-reasoned memorial to Lord Palmerston, urging upon Her Majesty's Government the importance of an early recognition of their claims on account of the opium surrendered for Her Majesty's service, "and the pressing and paramount necessity of placing the general trade of "British subjects upon a secure and permanent basis." The memorialists, after drawing attention to the facts, that no penalties had ever been enforced against foreigners importing opium into China, and that the laws prohibiting its importation were admitted by the Imperial Commissioner himself to have been "comparatively lax," continued as follows: "We may further state that the peculiar character of the "opium trade was distinctly recognised in the Report of the Select Committee of the "House of Commons in 1830, and that, in the subsequent Report, in 1832, the "Committee expressed their opinion that it does not seem advisable to abandon so "important a source of revenue as the East India Company's monopoly of opium in "Bengal. We conceive it will, therefore, be admitted that British subjects have "carried on this trade with the sanction, implied, if not openly expressed, of their "own Government; and at the same time with an advantage to the revenue of British "India, varying of late years from one to one and a half millions sterling.

"We do not attempt to deny the unquestionable right of the Chinese Government to "put a stop to the importation of opium, and have readily signed an agreement to "abstain from that trade at Canton on the first requisition of the Government to that "effect; but we think your Lordship will perceive that long prescription had hitherto "given foreigners ample reason to question the sincerity of the Chinese Government "with regard to the discontinuance of the importation; and that under any circum-"stances that Government cannot be justified by the lax observance of prohibitions "and open connivance of its officers, in at one time fostering a trade involving several "millions sterling, and at another rendering its pursuit a pretext for spoliation.

Letter from Captain Elliot to Lord Palmerston, commenced on the 18th and finished on the 29th May 1839, pages 409–411 of the correspondence.

An order received from the Imperial Government, on the day that Captain Elliot left Canton, directing that the opium surrendered should be sent to the capital, increased his suspicions as to the manner in which it would be disposed of. The expense of the transport to Pekin would, he said, be at least a quarter of a million

of dollars, and it naturally seemed incredible that such expense would be incurred for no purpose. The opium, however, was destroyed effectually at Canton under the Imperial Commissioner's own supervision, and Mr. King, an American gentleman, who objected on principle to the opium trade, and took therefore no part in it, appears to have witnessed a portion, at any rate, of the process. Captain Elliot also, on the 21st June 1839, said that the measures of the Imperial Commissioner had given an "immense impulse to the traffic in opium," and the remark can only be explained, on the supposition that the opium was destroyed, and that the price of the drug in China rose largely in consequence.

"The Middle Kingdom," by Dr. Wells Williams; and evidence of Mr. Inglis before the Select Committee of the House of Commons upon the China Trade in 1840.

Public declaration by Captain Elliot, dated 21st June 1839; pages 37–39 of additional papers (52 pages).

The departure of the English to Macao appears to have increased the tension, which already existed, between Captain Elliot and the Imperial Commissioner. The proscribed persons did not at once leave China, and the receiving-ships, which had delivered opium, were not removed from the outer seas; but the real cause of the rupture appears to have been Captain Elliot's refusal to agree to the bonds required. Captain Elliot tried to carry out his idea of establishing the headquarters of British trade at Macao, and successfully exerted his influence with his countrymen to keep British ships outside the Bocca Tigris. The Imperial Commissioner, not unnaturally, resented this, and although Captain Elliot offered further protestations of his readiness to separate the licit from the illicit trade, the Commissioner refused to receive his addresses, presented sealed in the manner agreed to by the Governor of Canton on the 25th April 1837, and attempted to induce the British merchants, captains, and seamen to disregard Captain Elliot's injunctions, and proceed to Canton. He attached also public proclamations to the walls of Macao giving his version of the occurrences, which had led to the suspension of trade and intercourse, and sent copies of the proclamations to the British ships.

Letter from Captain Elliot to Lord Palmerston, dated 27th Aug. 1839; pages 433 and 434 of the correspondence; and address from Captain Elliot to the Imperial Commissioner and Governor of Canton, dated 2nd Sep. 1839; page 460 of the correspondence.

Captain Elliot responded by publishing a manifesto to the Chinese, explaining his conduct on the 21st June, and communicated a copy of it under a public notice to British subjects. "The merchants and ships of the English nation," he wrote in the manifesto, "do not proceed to Canton and Whampoa, because the gracious commands "of the Emperor for their protection are set at nought; because the truth is concealed "from His Imperial Majesty's knowledge; because there is no safety for a handful of "defenceless men in the grasp of the Government at Canton; because it would be "derogatory from the dignity of their Sovereign and Nation to forget all the "insults and wrongs which have been perpetrated, till full justice be done, and till the "whole trade and intercourse be placed upon a footing honourable and secure to this "Empire and to England. That time is at hand: the Gracious Sovereign of the English "Nation will cause the truth to be made known to the wise and august Prince on the "throne of this Empire; and all things will be adjusted agreeably to the principles of "purest reason."

Public declaration and notice to British subjects by Captain Elliot, dated 21st June 1839; pages 37–39 of additional papers (52 pages).

The trade between Great Britain and China was not interrupted. British merchant ships remained outside the port, and the Americans, who had executed bonds as required by the Imperial Commissioner and had therefore remained at Canton, acted as carriers both of British goods and China produce between Hong Kong and Canton. Captain Elliot did not regard this form of trade with any favour, and moved the Governments of Great Britain and India to prohibit the importation of tea and other produce of China in British ships entering the port of Canton in violation of his injunctions, or in foreign vessels, until such time as he should declare the port of Canton safe for British trade. Circumstances, however, were too strong for him. The uncertainty, which existed, stimulated speculation in China, and the prices of foreign goods were high, and British merchants, though unwilling to enter the port and place themselves in the power of the Chinese, were not prepared to sacrifice their commercial interests to political considerations.

Letter from Captain Elliot to Lord Palmerston dated 28th Nov. 1839; page 43–45 of additional papers (52 pages).

Public notice by Captain Elliot, dated 25th July 1839; pages 451 and 452 of the correspondence.

Letter from Captain Elliot to Lord Palmerston dated 28th Nov. 1839; pages 43–45 of additional papers (52 pages).

The stringency, with which the policy of prohibition was enforced at Canton, merely had the effect of transferring the traffic in opium to Fuhkien and other parts of the Chinese coast, which were less efficiently protected, and the destruction of the opium surrendered caused the price of the drug to rise and increased the profits of the smugglers.

Letter from Captain Elliot to Lord Palmerston dated 18th July 1839, and enclosure; pages 431 and 432 of the correspondence.

At this juncture an affray took place, on the 7th July, at Hong Kong between a party of British and American seamen and the natives, and a Chinese named Lin Weihe was killed. Captain Elliot recognised at once the danger of the position, and tried vainly to take such measures as would satisfy the authorities, and prevent any demand for the surrender of an Englishman for trial, or, in other words, for execution. He advanced, at his own risk, a sum of 1,500 dollars to the family of the deceased, an act of liberality, which at once produced

unsolicited a written declaration that the man's death had been caused by accident; and offered rewards on behalf of the British Government to any person, who should adduce evidence leading to the conviction of any British subject or subjects for causing the death of the Chinese, or for instigating or promoting the riot.

Official communications from Captain Elliot to the officers deputed by the Imperial Commissioner, dated 13th and 21st July 1839; pages 440 and 441 of the correspondence.

Officers were deputed to Macao by the Imperial Commissioner to make inquiries in regard to the occurrence; and Captain Elliot at once opened communication with these officers, informed them of the steps he had taken, and assured them that the offender would, if discovered, be tried in accordance with the laws of Great Britain. "The "Government of the English Nation," he said, "would hold Elliot deeply guilty if he "failed to prosecute this affair with the utmost severity."

The Chinese officers, however, appear to have intentionally affronted Captain Elliot, and published edicts inciting the British merchants and seamen to disregard his authority; and on the 21st July Captain Elliot informed them that he would not receive any communications, until he should be satisfied that there would be no repetition of such proceedings, and until the higher officers of Government should think fit to receive his "sealed addresses according to custom."

He continued, at the same time, his own inquiries; and, as six British seamen were apparently concerned in the fatal affray, he ignored all difficulties of jurisdiction, and proceeded to try the men himself, so as to afford all possible satisfaction to the Chinese Government.

Letter from Captain Elliot to the Macao District Magistrate, dated 3rd Aug. 1839; page 441 of the correspondence.

The Chinese Magistrate at Macao was informed that the trial would be held on the 12th August at Hong Kong, and that, if any officers were deputed to attend, they would be received with the respect due to their rank; but the Magistrate took no notice of the intimation, and no Chinese officers attended.

Letter from Captain Elliot to Lord Palmerston, dated 27th Aug. 1839; pages 433 and 434 of the correspondence.

At the trial a boatswain, to whom suspicion attached, was indicted for murder, but the grand jury constituted for the occasion ignored the bill. Five other seamen were found guilty on charges of rioting and of rioting and assault, and were sentenced, two of them to imprisonment with hard labour for three months and to a fine of 15*l.* each, and the other three to imprisonment with hard labour for six months and to a fine of 25*l.* each.

Communication from Captain Elliot to the Chinese Magistrate of Macao, dated 16th Aug. 1839; pages 441 and 442 of the correspondence.

The result of the proceedings was communicated to the Macao Magistrate on the 16th August; and Captain Elliot declared solemnly that he had not been able to discover the person, or persons, who had caused the death of the Chinese. He made it clear, however, that the trial had been held in order that the guilty persons, if discovered, should be punished in accordance with the laws of Great Britain, and that the surrender of any British subject for trial by the Chinese was out of the question.

Letter from Captain Elliot to Lord Palmerston, dated 27th Aug. 1839; pages 433 and 434 of the correspondence.

The Imperial Commissioner was not satisfied. He moved to Heangshan, 40 miles from Macao, with 2,000 men; stopped the supply of provisions to the English at the Portuguese settlement; compelled their Chinese servants to leave them, and threatened to cut off the supplies of the Portuguese also, if they should continue to assist and protect the English.

Captain Elliot, therefore, after consultation with the Portuguese Governor, left Macao, on the 24th August, for Hong Kong, in the hope that his departure would induce the Imperial Commissioner to adopt a less threatening attitude.

Enclosures 2–7 in a letter from Captain Elliot to Lord Palmerston, dated 27th Aug. 1839; pages 435–439 of the correspondence.

A British passage-boat the "Black Joke," which was on its way from Macao to Hong Kong, was attacked, on the evening of the 24th, while at anchor at Lantao, by seven Chinese rowing boats manned and armed like those of the mandarins. Seven of the eight lascars who composed the crew, were killed, and the tindal (or captain) only saved himself by jumping overboard and clinging to the rudder. A British subject, named Moss, who was on board as a passenger, was brutally maltreated; and the Chinese, after carrying away several cases containing goods and personal effects, tried to blow up the vessel with gunpowder. They failed, however, in this attempt, and the unexpected appearance of another English vessel caused them to leave the schooner and depart. Mr. Moss had one of his ears cut off and received three stabs in one arm, and the ear, which was severed, was thrust into his mouth. A mandarin cap was found on board the "Black Joke" after the departure of the Chinese, and the vessel was not completely plundered, some cash, besides other property, being left on board. It was, therefore, supposed by some persons that the attack was made under official direction; and Captain Elliot, in December 1839, mentioned a rumour that the mandarin in command had been specially rewarded by the Imperial Commissioner for his services. Subsequent events lent some colour to this theory, but at the time that the outrage occurred Captain Elliot and others were of opinion that it was the work of pirates, who had been rendered daring by the confusion which existed; and the Chinese authorities are entitled to the benefit of the doubt.

Letter from Captain Elliot to Lord Palmerston, dated 6th Dec. 1839; pages 45–47 of additional papers (52 pages).

Another British schooner was, it may be added, chased by Chinese boats on the same evening, and in the same neighbourhood.

Captain Elliot's departure from Macao failed to appease the Commissioner. Edicts were posted on the walls of the town on the 25th August, which announced once more the laws, which had been enacted to prevent the importation of opium; insisted upon the immediate surrender of the murderer of Lin Weihe, and on the departure from China of all ships, which were not prepared to enter the port and discharge their cargoes at Whampoa; and threatened severe punishment to Chinese boatmen in the event of their supplying provisions to foreign ships lying outside Canton. Ships bringing opium to China in ignorance of the law, within 18 months of the date of the edicts, were to be allowed to trade on surrender of the opium; but any person concerned in the importation of opium after that time was to be punished with death; if a principal by decapitation, and if an accomplice, by strangulation.

Enclosure 3 in the letter from Commissioner Lin and Pu-ting-chiu, dated 27th August 1839; page 436 of the correspondence.

Edicts dated 25th August 1839; pages 439 and 440 of the correspondence.

The Portuguese Governor and Procurador were ordered to expel the English from Macao, and were informed that Chinese soldiers and police had been deputed to seize and punish any that remained. "So soon," it was said, "as the English be brought "to repentance, and deliver up the murderer, and when their merchant ships shall "have gone up to Whampoa, and the storeships and the foreigners (the 16 proscribed), "shall have returned to their country, their Excellencies will certainly grant them "the special favour of continuing their trade as formerly; and you, the Portuguese, "when you receive permission to trade with the English, you can then rent them your "houses as heretofore."

Enclosures 1, 2, and 6 in the letter from Captain Elliot to Lord Palmerston, dated 27th August 1839; pages 435 and 438 of the correspondence.

Another order followed, which contained a threat that the houses of British subjects would be surrounded on the night of the 25th August; and although the Portuguese Governor announced his intention of resisting forcibly any such measure, he was so much intimidated that he professed himself unable to afford protection to the English any longer. The English, therefore, were forced to fly from Macao on the morning of the 26th August, leaving their sick only behind in the Portuguese hospital, and to take refuge at Hong Kong, where Captain Elliot was anxiously awaiting their arrival, and a fleet of nearly 50 sail of British merchant ships was already assembled. H.M.'s sloop "Larne" had left China some time before, and Captain Elliot accordingly assumed military command, and made such preparations as were necessary to prevent a surprise of the fleet by Chinese war junks or fire-ships.

Letter from Captain Elliot to Lord Palmerston, dated 27th August 1839; pages 433 and 434 of the correspondence.

The departure of the English was said by the Chinese Magistrate of Macao, with evident satisfaction, to have been "precipitate and confused;" and the Portuguese Governor and Procurador were commended for the assistance which they had given in their expulsion, and were prohibited from supplying provisions to them at Hong Kong, under pain of severe punishment.

Official communication from the Keun-Min-Foo to the Portuguese Governor of Macao, dated 25th August 1839; page 441 of the correspondence.

The "respectful sense of duty" shown by the Portuguese was also specially commended by the Imperial Commissioner and Governor in a subsequent order.

Official communication from the Chinese officers at Macao to the Procurador, dated 29th August 1839; pages 5 of translation of official papers (12 pages).

The Portuguese Governor (according to his own account), replied to the Macao Magistrate's communication that the English had departed of their own free will; and although he was naturally afraid to offend the Chinese, he appears to have done as much as he could, up to the end of August, to assist the English without committing himself to one side or the other in the quarrel.

The Imperial Commissioner and Governor, on receiving the news of the departure of the English from Macao, issued a proclamation, on the 31st August, to the inhabitants of the Chinese villages along the coast, informing them that orders had been issued to cut off all supplies of water and provisions from the English, and directing them to arm themselves and prevent the English from landing to obtain either food or water, or to create disturbance. "If," it was said, "any of the said foreigners be found "going on shore to cause trouble, all and every of the people are permitted to fire "upon them, to withstand and drive them back, or make prisoners of them."

Proclamation by the Imperial Commissioner and Governor of Canton, dated 31st August 1839; pages 455 and 456 of the correspondence.

The proclamation summed up effectively enough the grievances, real and supposed, of the Chinese against the English. "Whereas," it was said, "the English foreigners, in "their overbearing pride and unpracticability, have withstood the prohibitory enact-"ments, those depraved individuals, who deal in opium, have continued to linger at "Macao; the empty storeships, which have surrendered their opium, have thus long "remained anchored in the outer seas; and newly arrived merchant vessels, neglecting "to surrender what opium they have brought, have collected together at Hong Kong "and the neighbourhood, neither entering Whampoa nor yet sailing back again, "whereby occasion was given in a drunken brawl to cause the death of Lin Weihe, "one of the people of the Empire; and whereas we, the Commissioner and the "Governor, having reiteratedly issued commands to the Superintendent Elliot justly

" to investigate and take proceedings therein, he has still withstood us, has not " received our commands, and has sheltered and failed to deliver up the murderer, " &c., &c."

Letter from Captain Elliot to Lord Palmerston, dated 3rd-7th Sept. 1839; page 442 of the correspondence.

The merchant ships were not left long without protection; as Her Majesty's ship " Volage," with Captain Smith in command, arrived opportunely at Hong Kong a day or two after the flight from Macao, bearing despatches from the Naval Commander-in-Chief in the East Indies, authorising Captain Elliot to offer the Portuguese Governor any assistance, he might require, to place Macao in a state of defence and repel any act of aggression, that might be attempted, by the Chinese. Captain Elliot accordingly, with the concurrence of Captain Smith, wrote to the Governor of Macao on the 1st September, proposing that British subjects should return to the settlement, and offering to place a force of 800 or 1,000 men at his disposal at once for the defence of the place.

Enclosure 1 in the above letter; page 443 of the correspondence.

Enclosure 3 in the above letter pages 445 and 446 of the correspondence.

The Governor was evidently glad to be rid of a disagreeable and dangerous responsibility; and in his reply, dated 3rd September, he declined politely the proffered assistance, informing Captain Elliot that, as the English had left Macao of their own accord, they could not be permitted to return, until their difficulties with the Chinese should have been satisfactorily adjusted.

" The British subjects," he wrote, " retired of their own accord from Macao, with a " view of not compromising this establishment, and by this step have placed them- " selves under the necessity of not landing here so long as all the difficulties now " existing shall continue unsettled; which difficulties the undersigned hopes to see " terminated satisfactorily for all parties, it not being allowable for him to vary in " anything from the maintenance of the neutrality above stated, until he shall receive " express orders from his Government in that respect."

Enclosure 1 in a letter from Captain Elliot to Lord Palmerston, dated 5th Sept. 1839; page 448 of the correspondence.

On the 2nd September a notice was found posted on shore at Hong Kong to the following effect: " Poison has been put into this water, which will destroy the bowels " if it be drank. Let none of our people take it to drink." Captain Elliot accordingly issued a proclamation to the natives, informing them that he would be responsible for the preservation of the peace as long as provisions and water were supplied, but that a conflict would inevitably result, if provisions were not forthcoming and the water was poisoned, and pointing out that such inhumanity was an unworthy return for the kindness, which had been frequently shown by the British to shipwrecked Chinese, of whom " several hundreds " had been saved and restored to their homes since he had been in China.

Postscript to the above letter, page 447; and enclosure 5 in the letter: page 450 of the correspondence.

An edict from the Imperial Commissioner and Governor, which reached Captain Elliot about this time, was refused in consequence of his resolution to receive no more official communications; but he took the opportunity to forward in reply by the messenger, who brought the edict, a strong remonstrance in writing against the recent proceedings of the Chinese Government. " Is it," he wrote, " consistent with peace, " or with the dignity of the Empire, to drive forth from their houses, and to deprive " of supplies of food, and of attendance, women in the pains of child-birth, sick " persons, and young children, upon the pretext that Elliot does not deliver up a man " to be killed, although he has solemnly and repeatedly declared that he has strictly " investigated, according to the laws of his country, and that he is unable to discover " who the guilty man is; and although it is most certain that the seamen of American " ships were on shore, and engaged in the riot which led to this disaster. Is it desired " that Elliot should deliver up any man indiscriminately, and involve the higher " officers, as well as himself, in the guilt of murdering an innocent man?"

The hostile spirit, which had prompted the attack on the " Black Joke," and the poisoning of the water at Hong Kong was, he suggested, a result of the incitements to violence contained in the inflammatory proclamations recently published at Macao; and the interruption of official communication was ascribed to the refusal of the Imperial Commissioner to receive his sealed addresses, and to the measures which he had taken to deprive the English both of servants and food, and to inflame the Chinese people against them.

" Let these things," he concluded, " be adjusted, and Elliot is ready immediately to " open honourable and friendly communication with the officers, and use his sincerest " efforts to settle all things according to the principles of reason and justice, upon the " basis of effectually separating the lawful trade from the unlawful, and of securing " the faithful payment of the Imperial duties by the British ships."

Letter from Captain Elliot to Lord Palmerston dated 5th Sept. 1839; and enclosures 2, 3,

On the 4th September Captain Elliot proceeded with Captain Smith to Kowlune, a place about four miles distant from the anchorage of the British ships at Hong Kong, where four men-of-war junks were stationed, which prevented a regular supply of

provisions. Captain Elliot was in his own cutter, and was accompanied by a small armed vessel, named the "Pearl," and by the pinnace of the "Volage." The junks were found at anchor under the cover of a battery; and Captain Elliot sent the the Rev. C. Gutzlaff to the largest of the junks to explain that several thousand British subjects at Hong Kong were in want of supplies of food, and that "frequent conflicts" must ensue, if they were not permitted to procure them. Mr. Gutzlaff was received without rudeness; but after a discussion, which lasted for five or six hours, he was informed that nothing could be done without the sanction and orders of the Imperial Commissioner. A promise was indeed held out that some food would be supplied, as a present without payment, to relieve their immediate necessities; but, in Mr. Gutzlaff's opinion, this was merely a ruse to gain time to man the fort, where numbers of Chinese were seen to be assembling. Captain Elliot then sent some men in a boat to a distant part of the bay to purchase food; and this they successfully accomplished, and were in the act of bringing their purchases away when some mandarin peons arrived and prevented them from doing so.

and 4; pages 446–449 of the correspondence.

Captain Elliot's patience was exhausted, and he opened fire upon the junks from his cutter and the other two vessels. The Chinese replied to the fire, both from the battery and from the junks; and after an engagement, which lasted nearly half an hour, Captain Elliot was obliged to haul off for want of ammunition, as no preparations had been made for hostilities. The junks, however, had suffered considerably, and made sail and tried to escape. Captain Smith went off in the pinnace to fetch the "Volage," and Captain Elliot again engaged the junks with the cutter and the "Pearl," and beat them back to their former anchorage. Night then began to fall, and Captain Elliot again drew off, and joined Captain Smith, who was entering the bay in the "Volage" for his assistance.

During the night Captain Elliot repented of his rashness, his action having, as he said himself, been difficult of vindication under any less aggravating circumstances; and decided to discontinue hostilities. Captain Smith was apparently prepared to destroy the battery and the junks; but, on Captain Elliot's recommendation, he took the "Volage" back to Hong Kong, and remained there upon the defensive against any attack, that might be organised by the Imperial Commissioner, upon the merchant ships.

On the 5th September Captain Elliot published another notice to reassure the people at Hong Kong as to his intentions. "The men of the English nation," he said, "desire "nothing but peace; but they cannot submit to be poisoned or starved. The Imperial "cruisers they have no wish to molest or impede, but they must not prevent the people "from selling. To deprive men of food is the act only of the unfriendly and the "hostile."

The Imperial Commissioner and the Governor responded to this affair by a proclamation to the merchants and seamen, urging them once more to disregard Captain Elliot's authority, and trade upon the conditions approved by the Chinese Government. "The English foreigner, Elliot," they said, "having in repeated instances withstood and "opposed the laws; having concealed and failed to deliver up a murderer, having "prevented the merchant vessels from entering the port; having ruled and, directed "extensive sales of opium; the charge of crime against him is most clearly established, "as by our reiterated proclamations and clear commands we have already shown."

Enclosure 4 in a letter from Captain Elliot to Lord Palmerston, dated 30th Sept. 1839; pages 11 and 12 of additional papers. (12 pages).

"Now on the 4th September he had the daring presumption to send a number of "vessels of various size to Kowlung (*sic*), and directed them to fire upon and attack the "naval cruisers. Between noon and 8 p.m. they had several encounters, and wounds "were inflicted on the Government soldiery. In this, since he has come forward to "seek a quarrel, we, the Commissioner and the Governor, cannot but command the "assembling of the powerful companies of the army and navy from the several "regiments and squadrons, that they may combine in an attack of extirpation, and "place his life in our hands."

The engagement, however, had the effect of inducing the Chinese to relax the rigour of their preventive measures, and provisions were subsequently supplied, on payment, to the ships at Hong Kong in sufficient quantities, and the notices regarding the poisoning of the water were removed.

Letter from Captain Elliot to Lord Palmerston dated 23rd Sept. 1839; pages 454 and 455 of the correspondence.

On the 7th September a number of the British merchants in China submitted another memorial to Lord Palmerston, complaining of their expulsion from Macao, and of the violence and injustice of the Imperial Commissioner's proceedings in regard to the affray at Hong Kong, and urging again the necessity for the interposition of the British Government, to convince the Chinese that outrages upon British subjects would no longer be tolerated, and to place the trade upon a satisfactory footing.

Enclosure in a letter from Captain Elliot, Lord Palmerston, dated 8th Sept. 1839; pages 452 and 455 of the correspondence.

Letter from Captain Elliot to Lord Palmerston, dated 8th Sept. 1839; pages 450 and 451 of the correspondence.

In a letter to Lord Palmerston, dated 8th September 1839, Captain Elliot complained of the manner in which his attempts to re-establish the British trade had been thwarted by the action of the Americans at Canton; firstly by their submission to the intolerable conditions imposed upon foreign traders by the Imperial Commissioner, and secondly by their denial of any participation by American seamen in the riot in which Lin Weihe was killed. He recommended therefore that a representation should be made to the American Government in regard to their proceedings; and expressed a hope that Her Majesty's Government would take such steps, as might be necessary, to prevent the entrance of cargoes of China produce into the United Kingdom in foreign vessels, until such time as the trade should be placed upon a basis which would permit British merchants to carry on British business.

Captain Elliot was piqued, not unnaturally, with the Americans for not supporting the policy he had thought it necessary to adopt, as he had in the earlier stages of the Imperial Commissioner's proceedings assisted the Consul to the best of his ability. Their submission also on the question of the bonds undoubtedly increased the difficulty of effecting any arrangement with the Chinese Government upon terms different from those which they had agreed to; and their conduct in throwing the whole blame of the Hong Kong riot upon the English, as Lin himself in a subsequent communication said that they had done, was ungenerous and apparently also unjust.

It is, however, most improbable that any compromise, which Captain Elliot could have effected, would have averted war for any length of time; and the British merchants, and also, it may be said, the people of Great Britain profited by the trade which the Americans were able to carry on. The Board of Trade also was of opinion that tea and other produce of China, water-borne at Canton, and received on board a vessel bound for Great Britain at Hong Kong, or any other place on the coast of China, were properly admissible for consumption in Great Britain; and no action was consequently taken to prevent the entrance of cargoes transhipped from American vessels.

Copy of directions to the Commissioners of Customs for the admission of goods from China, brought in foreign vessels from Canton and transhipped into British ships; presented to Parliament on 19th March 1840.

On the evening of the 8th September, the master of a British ship, "The Psyche," at Hong Kong left the harbour in a boat, with a party of 15 men, to reconnoitre a passage in the vicinity, which was said to be occupied by war junks. The boat was caught by an adverse tide, and the party pushed on to Macao. Captain Elliot and Captain Smith, on hearing of the departure of the boat, despatched search-parties under the command of officers of the "Volage," and offered rewards to the natives for news; but such information, as they were able to obtain, led them to suppose that the boat had been cut off, and that the whole party had either been killed, or were prisoners at the Bocca Tigris.

Letter from Captain Elliot to Lord Palmerston, dated 23rd Sept. 1839; pages 454 and 455 of the correspondence.

The proclamation of the Imperial Commissioner and Governor of the 31st August, calling on the natives to arm themselves and prevent the English from landing, which fell into Captain Elliot's hands about the same time, increased his anxiety and irritation; and he accordingly wrote to Captain Smith, requesting him to declare a blockade of the port and river of Canton. At the same time to make it clear that the British Government was in no way countenancing or protecting the contraband traffic, he issued a Memorandum to the commanders of British vessels at Hong Kong and to all Her Majesty's subjects, informing them that the Imperial Commissioner had justified his proceedings by the allegation that some of the British subjects at that anchorage were still trading in opium, and requiring all British vessels engaged in the traffic to immediately leave the harbour and coast.

Enclosure 1 in the above letter; page 455 of the correspondence.

Enclosure 3 in the above letter; page 456 of the correspondence.

Captain Smith fully concurred as to the necessity for the blockade in the interest, as he said, of self-preservation; and gave formal notice of his intention to establish it on the 10th September. Ships actually within the port, or entering it within six days from the date of the notice, were however to be allowed to leave.

Enclosures 4 and 5 in the above letter; page 457 of the correspondence.

The anchorage at Hong Kong was open to attack from several points; and the enforced residence of ladies and children on board ship was doubtless attended with considerable inconvenience. Captain Elliot therefore, on the 12th September, informed the Portuguese Governor of Macao of the intended blockade; and requested him once more to give an asylum to British merchants and their wives and children, and to permit British cargoes of goods specified in the Chinese tariff to be landed at Macao on payment of the usual duties. "In the name," he wrote, "of Her Britannic Majesty's "Government, he takes this occasion once more to request refuge for the British "merchants and their families at Macao; neither can he think that the Chinese autho- "rities would seriously consider the protection of a handful of men, women, and "children to be a breach of that neutrality which your Excellency desires to observe in "the struggle between the British and Chinese Governments, or incur the risks of "serious disputes both with the Courts of Great Britain and Portugal, by acting upon

Letter from Captain Elliot to the Governor of Macao, dated 12th Sept. 1839; pages 8 and 9 of additional papers. (12 pages.)

" pretensions so hostile to both, and so flagrantly insulting to your Excellency's " Government."

Letter from the Governor of Macao to Captain Elliot, dated 14th Sept. 1839; pages 10 and 11 of additional papers. (12 pages.)

The Portuguese Governor replied, somewhat indignantly, that he could not conceive how Captain Elliot had again requested that British subjects should be permitted to return to Macao, in the face of his communication of the 3rd September, and of the fact that they had withdrawn in the first instance of their own accord; and declared that there were abundant reasons for continuing "the same line of conduct, alike " salutary, convenient, and necessary for both Nations." He regretted also that it was not in his power to assent, without permission from the Chinese authorities, to the proposal to land British merchandise in the settlement.

In the meantime, a Spanish brig, "the Bilbaino," which had arrived from Manilla and was lying in the Macao roads, was attacked before daylight on the morning of the 12th September by four war-junks and a number of mandarin boats, and was plundered and afterwards burnt. The captain was on shore, but the mate, a Spaniard, was on board with the crew, which was composed entirely of natives of Manilla. The Manilla men, with one exception, jumped overboard and were afterwards picked up by the Chinese. Six of them were put on shore, and ten were left in the ship's long boat without oars or rudder. Four men, however, were either killed or drowned; and the mate and the one Manilla man, who remained with him, were carried off as prisoners to the Bocca Tigris.

Letter from Mr. Castro to Captain Elliot, dated 13th Sept. 1839; page 6; and letter from Captain Elliot to Lord Palmerston, dated 6th Dec. 1839, and enclosures; pages 45–52 of additional papers. (52 pages.)

The "Bilbaino" was flying the Spanish flag; but was attacked by the Chinese, apparently under the impression that she was the "Virginia," one of the British receiving-ships, from which opium had been delivered to the authorities in accordance with Captain Elliot's notice. This impression had no foundation. The brig, as Captain Elliot reported, had been in the Macao and Manilla trade for three years, and had never belonged to any persons other than subjects of Spain; and apparently had not been at any time engaged in the opium traffic.

Conditions of amicable arrangement forwarded in the name of the Commissioner and Governor; pages 7 and 8; and letter from Captain Elliot to Lord Palmerston, dated 6th Dec. 1839; pages 45 to 47 of additionalpapers (52 pages).

On the 13th September Captain Elliot, before receipt of the reply to his letter from the Portuguese Governor, proceeded with Captain Smith to Macao, and fell in on the way with a British ship, which was conveying the missing reconnoitring party back to Hong Kong. Both officers, on being assured of the safety of the party, were agreed that no further measures of hostility should be taken; and Captain Smith, on their return to Hong Kong, published on the 16th September a notice to the effect that the projected blockade would not be established. The blockade would of course have prevented all foreign trade, and some of the Americans at Canton appear to have protested against it, and to have informed Captain Smith that they would hold the British Government, and him personally, responsible for any lives that might be sacrificed, or losses that might be sustained, by American citizens, in consequence of its institution; but the protest was not referred to by Captain Elliot in his official explanation of the reasons, which had induced him to abandon the project, and there is nothing on record to show that he was in any way influenced by it.

Letter from Captain Elliot to Lord Palmerston, dated 23rd Sept. 1839; pages 454 and 455 of the correspondence.

Speeches made in the House of Commons by Sir J. Graham and Lord Palmerston, on 7th and 9th April 1840. Hansard's Parly. Debates, 3rd Series. Vol. LIII.

Captain Elliot, moreover, hearing that the Imperial Commissioner was alarmed at the protracted continuance of the disagreement, and thinking that the mistake made in regard to the "Bilbaino" might make him more desirous of an understanding, reopened communication with the Chinese authorities at Macao, and made another earnest effort to avert the hostilities that were impending.

Letter from Captain Elliot to Lord Palmerston, dated 16th Nov. 1839; pages 3–5 of additional papers. (52 pages.)

"Elliot," he wrote to the District Magistrate on the 14th "September, has now " arrived at this place in the cruiser of his nation, and desires to open communications " with the honourable officers concerning affairs of importance. For many years " Elliot has transacted business with the high officers of this province with faithfulness; " and what can he desire but peace and goodwill."

Enclosures 2 and 3 in the above letter; page 6 of additional papers. (52 pages.)

The Portuguese Governor and Procurador also appear to have been asked to use their good offices with the local Chinese officers to promote an understanding.

Captain Elliot at the same time offered to assist the consignee of the "Bilbaino" in obtaining the release of the mate and seaman, who were in the hands of the Chinese; but the consignee, who was a Spanish merchant at Macao, was unwilling to avail himself of the offer, partly because he had already appealed to the Portuguese Governor, in whose jurisdiction he considered that the outrage had occurred, and partly because he feared that the interference of the British Superintendent might furnish the Commissioner with a pretext for insisting that the men were British subjects.

Letter from Captain Elliot to Lord Palmerston, dated 6th Dec. 1839; pages 15 17 of additional papers. (52 pages.)

The negotiations opened with the Macao Magistrate were continued for more than five weeks. The Imperial Commissioner and the Governor communicated on the

Enclosures 3 and 4 in the letter from Captain

Elliot to Lord Palmerston, dated 16th Nov. 1839: pages 6-8 of additional papers. (52 pages.)

20th September through the Magistrate three conditions, upon the fulfilment of which they would be prepared to effect some arrangement, as proposed by Captain Elliot, for the resumption of trade, pending the receipt of instructions, which he was expecting, from England :—

1. That all opium in the ships at Hong Kong should be at once surrendered;
2. That the murderer of Lin Weihe should be given up, or that the seamen, who were known to have been engaged in the riot, should be sent to the officers of the Celestial Empire for trial, on the understanding that one only should answer for the crime, and the others should be sent back;
3. That the opium receiving-ships should be removed beyond the Great Ladrone, and that all the persons who had been banished from China, but had not yet complied with the order, should depart immediately.

"If," they said in conclusion, "there be delay, and no answer be returned beyond "the middle decade of this eighth month (the end of September) then shall the "martial valour of the naval and military forces be all led forth, the offence proclaimed, "and its punishment required. Repentance will then be fruitless."

Enclosures 5-7 in the same letter; pages 9-11 of additional papers. (52 pages.

Captain Elliot, on receiving this communication, proceeded at once to Macao, and replied to it from that place on the 24th Sptember.

1. As to opium, he urged that there ought not to be any on board of any English ship at Hong Kong, as he had already taken measures to require the departure from the coast of all English vessels engaged in the traffic; and promised that, if the Chinese wished to search any ship or ships, he would arrange that they should be accompanied by officers of his establishment, and if opium was found, he would not offer any objection to the seizure and confiscation of the cargo of the ship concerned. He agreed further that if it should be proved that any English merchants were secretly deriving a profit from the sale of opium from any English ship, he would not intercede in their behalf, if the whole firm should be expelled from China.

To prevent an illicit trade in opium in the future, he proposed: (*a.*) That no English firm should be permitted to transact business, or to reside in China, unless each member of it should sign a declaration that he would have no concern, direct or indirect, with the opium traffic; that he would not permit any person under his control to be concerned in it, and that he was aware of the existence of a regulation, authorising his expulsion from the country, in the event of his breaking faith; and that all such declarations should be countersigned by him, or by some other officer of the British Nation, and should be submitted by him to the Chinese Government. (*b.*) That no British ship should be permitted to trade with China, unless the commander and consignee should, on the day of its arrival, deliver to Captain Elliot a solemn declaration to the effect that there was no opium on board, and that none would be received during the stay of the ship in China; and unless he should submit this declaration to the officers of the Chinese Government with a certificate, that he believed it to be true.

"If," he said, "the high officers will thus far confide in the good faith of an English "officer, Elliot assures them that this regulation will effect the separation of the "lawful from the lawless trade."

(2.) As to the case of Lin Weihe, he again stated that there were many sailors—American and English—on shore at the time, and that he had been unable to discover the guilty person. He promised, however, that inquiries should be continued, and that the guilty person, if discovered, should be placed on his trial in accordance with the laws of Great Britain, before officers of the Chinese Government. "But now," he added, "let a sure and satisfactory mode of joint investigation be determined upon, "congenial with the customs of the Empire and of his own nation. Thus will all "future matters of the like nature be arranged agreeably to prescribed rule; and "perpetual peace will be preserved."

(3.) Finally, he undertook to arrange that the proscribed individuals then remaining, and the ships that were formerly used for the storage of opium, should leave China as soon as the first northerly wind, which was expected in a few days, should set in. He interceded, however, for two of the sixteen, who, as he said, had not traded in opium, Mr. D. Matheson, then a youth, and Mr. Henry; and suggested that the order of banishment should in their case be rescinded.

He expected, he added in conclusion, to receive instructions from England in about four months; and, until these instructions were received, it would be impossible for the ships to proceed to Whampoa.

Letter from Captain Elliot to Lord Palmerston, dated 16th Nov. 1839: pages 3-5; and

The submission of this reply was followed by discussions with the Chinese officers at Macao in regard to the case of Lin Weihe. Captain Elliot promised to offer a reward of 2,000 dollars for information, which would lead to the discovery of the man

who had caused his death, but declined to countenance any pretext for hushing the matter up. The corpse of a British seaman had been found in Hong Hong Harbour some days before; and on the 27th September the mandarins questioned Captain Elliot about this, and tried in vain to induce him to declare that this was the corpse of the guilty man. This attempt to act on the precedent established by the "London" case having failed, the Chinese were prepared to repeat the infamous procedure adopted on the occasion of the Cumsingmoon affair in 1833; and repeated suggestions were made, during the negotiations, to the effect that the Hong merchants should be permitted to persuade some lascar, or to purchase some Macao slave, to personate the offender. There is nothing to show how far these suggestions were authorised; but from the tenor of Lin's communications, there is reason to believe that the Chinese would have contentedly executed any person whom Captain Elliot might have been pleased to surrender, without any scruples as to whether he was really guilty.

enclosures 8 9 in the letter pages 11 and 12 of additional papers. (52 pages.)

On the 28th September a movement of the Chinese fleet from Chuenpee caused Captain Elliot to return to Hong Kong to look after the shipping, but the negotiations were not interrupted on this account; and on the day of his departure the Imperial Commissioner and Governor announced, direct to him, their orders on his reply to their communication of the 20th September.

Enclosures 10 and 11 in the above letter; pages 12–15 additiona papers. (52 pages.)

1. Captain Elliot was directed to examine the ships at Hong Kong again, as it appeared most improbable that there was no opium on board, and two Chinese had deposed to the purchase of opium from a vessel there at anchor; and Chinese officers would, it was said, be deputed to search the ships after he had completed his examination. If at this search the ships were found to be free from opium, an arrangement would be made to enable them to discharge their cargoes at some place, (other than Macao), appointed for the purpose. The declarations, proposed to prevent illicit trade in the future, were regarded as satisfactory; but it is said, "it will still be "requisite to state clearly, that obedience shall be paid to the new law declared by the "Emperor: if any bring opium, the parties shall be immediately executed, and the "vessel and cargo confiscated to Government."

2. A period of 10 days was allowed to Captain Elliot to discover the murderer of Lin Weihe, and deliver him up for trial and punishment; and measures of extermination were threatened in the event of further delay and evasion. "The brave "forces," it was said, "naval and military, that are now everywhere stationed, are "assembled as clouds upon the various waters. There must be no more glossing "pretexts for delay, drawing down measures of extermination."

3. The proscribed persons then remaining were allowed six days to return to Macao and settle their affairs; and they, and also the receiving-ships, were then to leave China at once, as the northerly wind had set in.

4. All "Chinese traitors," other than the compradores and working-men engaged through the Hong merchants, who were then in concealment in the vessels at Hong Kong, were to be made over to the officers of Government.

"The Celestial Empire," they concluded, "is a great one, cherishing as its children "the small. All outer foreigners, who come to China to trade, and pay implicit "obedience to the laws, look up to invite the Imperial grace to show tenderness "towards men from afar. It is not allowable carelessly to bring forward such "expressions as 'mutual harmony,' and insert them in addresses, to the infraction of "the requirements of dignity, whereby severe commands are called forth."

Captain Elliot replied, on the 5th October, that the ships at Hong Kong might be searched at once; that orders from England regarding the words required in the bonds might be expected in four months; that of the sixteen proscribed British subjects, six had gone and four others were on the point of departure; that of the English receiving-ships, eight only remained, of which one had been sold to the Americans, and three were to be broken up; that he had not been able to discover the murderer of Lin Weihe, but would continue to make strict inquiry, and that he knew nothing about the Chinese said to be concealed on the British ships, and thought it probable that they had all absconded. "The English nation," he said, "is the equal of any "other on the face of the earth in justice and power; and in using expressions suitable "to her station, there is no desire to offend the dignity of this Empire. Elliot "requests that the language of the high officers towards him, the officer of his nation, "may no longer be contumelious."

Enclosure 12 in the above letter; page 16 of additional papers. (52 pages.)

Other correspondence followed with the Macao District Magistrate, principally regarding the departure of the proscribed individuals and the receiving-ships; and on the 8th October the Imperial Commissioner and Governor, in consideration, as they

Enclosures 13–17 in the above letter; pages 16–22 of additional papers. (52 pages.)

said, of the delay from which British ships had already suffered, sanctioned a modification of their original orders in regard to the execution of bonds.

1. Ships, of which the commanders were prepared to execute bonds in the prescribed form, were to be allowed to trade as usual; and all other ships were to be searched at a place outside the Bocca Tigris, the cargo being removed into lighters for the purpose. If any opium were found in a ship, the offender was to be executed and the ship and cargo confiscated; but if no opium were discovered, the ship would be allowed to trade. Three days were allowed for the departure of all vessels neither giving bonds, nor submitting to search, and after that time fire-ships would, it was said, be sent to destroy them. "As to vessels with cargoes hereafter arriving," they said, "they will all, without reference to their having, or not, executed the obligations, (or) "to their having or not been searched, be required always, each time that they come "to Canton, to execute an obligation in the same form. If they will not execute an "obligation, or do not execute it according to the prescribed form, they shall, upon "no terms whatever, be admitted to trade."

2. A further period of ten days was allowed for the surrender of the murderer of Lin Weihe; and after the expiration of this period they threatened that they would waste no more words upon the Superintendent, but would send ships to take the master, merchant, mates, and seamen of the vessel concerned, and would then select from them the principal offender to atone for his crime, and send the others back.

3. The remaining receiving-ships and proscribed persons were to leave without further delay. Mr. Henry, however, was permitted to remain under surveillance, as Captain Elliot said he had never dealt in opium. Mr. D. Matheson was required to depart as being a member of Mr. Jardine's firm. "In conclusion," they said, "the "commands which we, the Commissioner and the Governor, have at various times "given, have been no otherwise than in pursuance of the principles of justice, or for "the complete exhibition of needed instruction and monition. Where has been the "contumelious language? As to what may be the power of that nation in comparison "with other nations, the Celestial Empire cares not to inquire over much. Let not "any thoughtless bragging representations be confusedly made."

Enclosure 18 in the above letter; page 23 of additional papers. (52 pages.)

On receiving these orders, Captain Elliot rather hastily came to the conclusion that the Commissioner and Governor intended to drop the question of the surrender of a British subject for execution, and informed them, in reply, that it would be easy for him to arrange everything in accordance with their wishes, and that he would proceed again to Macao on the 15th October for the purpose. "Concerning," he wrote, "the "apprehension of the murderer of Lin Weihe, he can only repeat that he will continue "to use all diligence, and report to their Excellencies, as soon as he is discovered, to "the end that he may be placed on his trial." He proceeded accordingly to Macao, and after some days of discussion effected an arrangement, on the 20th October, with the Hong merchants, which provided that the British trade should be carried on outside the Bocca Tigris at an anchorage near Chuenpee, without execution of the required bonds, on condition that the ships and cargoes should be subject to examination, that the cargoes should be transported to and from Canton in Chinese boats, and that port dues, pilots' charges, and linguists' fees should be paid in the usual manner.

Public Notice to British subjects, dated 20th Oct. 1839; pages 5 and 6 of additional correspondence (14 pages); and enclosures 19 and 20 in the letter from Captain Elliot to Lord Palmerston, dated 16th Nov. 1839; pages 23 of additional papers. (52 pages.)

Captain Elliot appears to have been perfectly satisfied as to the authority of the Hong merchants to conclude an arrangement of this kind, and on the 21st October he wrote as follows to Lord Palmerston:—"In my despatch of the 23rd ultimo, I "expressed the hope, that it would soon be in my power to put an end to the state of "great danger and difficulty then existing; and I have now to report its realisation in "an adjustment; temporary, indeed, but honourable. The British community is "returning to Macao; the ships will proceed immediately to discharge their cargoes, "and, in all respects, there is a restoration of the usual tranquillity; neither has there "been any departure, as your Lordship will hardly need to be told, from the principles "that it was impossible for me to deliver up a man in compensation for the native "Lin Weihe, or to accede to signing of a bond of consent to the trial and capital "punishment of the Queen's subjects by Chinese forms of proceeding."

Letter from Captain Elliot to Lord Palmerston, dated 21st Oct. 1839; page 1 of additional correspondence. (14 pages.)

British subjects were informed of the arrangement arrived at, and a committee of British merchants, deputed from Hong Kong for the purpose, met the Hong merchants at Macao, and discussed and settled with them the details of the scheme.

Minute by the Committee of British merchants, dated 22nd Oct. 1839; pages 7 and 8 of additional correspondence. (14 pages.)

The arrangement was at the best a makeshift; and difficulties would probably have arisen in regard to the examination of cargoes and ships by the officers of the Chinese Government. It seems also somewhat doubtful whether it would have

been accepted entirely by the Imperial Commissioner and Governor. Any prospect, however, that it might have had of success was effectually marred by the selfish and unpatriotic conduct of Captain Warner and Mr. Daniell, who had been one of the supracargoes of the East India Company, and was then a private merchant in China. Captain Warner arrived from Singapore in a ship, the "Thomas Coutts," consigned to Mr. Daniell, during the progress of Captain Elliot's negotiations; and although he was aware that the negotiations had reached an advanced stage, he applied for a pilot and proceeded to the Bocca Tigris, and there signed a bond in the form required by the Imperial Commissioner, and the ship was at once taken to Whampoa.

Letter from Captain Elliot to Lord Palmerston dated 5th Nov. 1839; pages 8-11 of additional correspondence. (14 pages.)

On the 22nd October Captain Elliot informed the Chinese Magistrate of Macao of the conclusion of the arrangement with the Hong merchants; and requested that orders might be issued, authorising pilots to take the merchant ships up the river for examination, and that no opposition might be offered to the return to the settlement of the British merchants and their families, several of whom had been emboldened by the favourable aspect of the negotiations to make their way back.

Enclosures 20-2 in the letter from Captain Elliot to Lord Palmerston, dated 16th Nov. 1839; pages 23-25 of additional papers. (52 pages.)

The Magistrate replied that the merchants and their families must wait until orders could be obtained from the Commissioner and Governor; but no action was taken to expel those who had returned.

Captain Elliot then requested that the servants might be restored and supplies furnished, and that communication with Canton might be permitted in the usual manner; and the Magistrate promised to apply for sanction to this request, if the Superintendent would arrange to send the merchant ships at once to the place appointed for their examination, and would comply with the other orders which had been issued.

On the 25th October, however, the Imperial Commissioner passed orders to the effect that at least two hundred days would be occupied in the search of the ships, and that until it was completed the English could not be allowed to return to Macao, and that their supplies must be strictly cut off, and any, who had returned, expelled. If, however, he said, bonds were given in the prescribed form, everything without exception might be permitted to go on as usual.

Enclosure 26 in the above letter pages 29-31 of additional papers. (52 pages.)

These orders were communicated on the 26th October by the Macao Magistrate and an officer specially deputed by the Commissioner; and on the same day these officers announced in another communication further orders by the Imperial Commissioner and Governor in regard to the proposed arrangement for carrying on the trade outside the Bocca Tigris. "When I, the Commissioner," said Lin, "on the 20th "September, first issued my commands, I set down in order these three things, in the "prior place, the surrender of opium, the delivering up of the murderer, and the "sending home of the empty store-ships and the depraved foreigners.

Enclosure 24 in the above letter; pages 25-28 of additional papers. (52 pages).

"In all such parts of my commands as related to the entrance of the vessels, I stated "that if they should act obediently in each of the three preceding particulars, it would "then not be difficult to resolve on the granting of favours. Let me ask now, if at "this moment these three particulars have indeed been duly arranged? And though, "it may be said, that there is no opium to be surrendered, and that the depraved "foreigners and the empty store-ships are being sent home, how is it that the principal "murderer in a most important case of homicide has been set aside, as not to be "inquired about? If indeed the said foreigners were to give the bonds in accordance "with the prescribed form, it might yet be suffered, that time should be allowed to "arrange that matter; but now, while it is far otherwise, how shall the granting of "permits be at once sanctioned?

"Moreover, in my commands of the *9th October, and proclamation of the same date, "it was declared that this was a modification beyond the bounds of rule, granted upon "the present occasion, in consideration for the protracted delay which all the vessels "had suffered; that vessels hereafter arriving would all be required to execute an "obligation in accordance with the form prescribed; that, if not according to the "form, they should upon no terms whatever be admitted to trade. But from what "the foreign merchants now declare, it seems that hereafter also they will be equally "unwilling to execute the obligation; that their idea is to continue selling opium. "To what end, then, will the searching the cargoes upon the present occasion tend? "Regarding the crowding back to Macao of the foreign merchants and their families, "how can any encroaching be allowed, or indulgence be shown while these matters "are yet in confusion? I require you immediately, in concert with the Commodore of "the Heang-shan Station, and my deputed officer, to act faithfully in driving them "forth, and to urge the Portuguese foreigners to join also in pushing them out of "Macao; their stay must not be suffered. The cargo-ships, which do not give the

* *i.e.*, 8th October.

" bonds on this occasion, must yet, in accordance with my former commands, be " interrogated whether or not they will give the bond according to the prescribed " form upon the next occasion; and they must be required, severally, to give " certificates. Such as will express their willingness to give the bond may, on the " present occasion, be allowed to await search. If they are unwilling, on any after " occasion, to give the bond, it would be better they should on this occasion return " home, and they shall be required within three days to take their departure. . . . .

" Regarding the murderer in the case of homicide, Elliot must still, as in my former " reply, be required to send up for trial the five men detained by him. If he continue " to oppose and delay, I must call upon the Naval Commander-in-Chief to proceed at " the head of his war vessels and fire-ships, as also of the land soldiery encamped at " all the various points of ingress, that they may join in seizing the murderous " foreigner, making it imperative on them to bring him up for trial and punishment; " and at the same time to search for and apprehend all the traitorous Chinese in " shelter and concealment on board the various ships. And when they are brought " to submission, it will then be time to consider of regulations for their search and " admission into the port.

" I, the Commissioner, am sworn on behalf of the Celestial Empire to remove " utterly this root of misery; nor will I let the foreign vessels have any offshoot left " for the evil to bud forth again."

The Governor also in his orders insisted on the necessity for the execution of bonds, as a guarantee of good faith, and on the difficulties which would attend any scheme for the examination and removal of cargoes outside the port.

" As soon as this communication reaches the said Superintendent," wrote the District Magistrate and Commissioner's Deputy, " when announcing these orders, " let him immediately pay obedience in the matter of their Excellencies' replies, and " speedily deliver up at once the murderous foreigner; let him also send home all " the depraved foreigners and opium store-ships. If the cargo-ships will give the " required form of bond in the same manner as Warner's ship has done, they shall " then be permitted to proceed to Whampoa. Such as are unwilling to give the " bond and proceed to Whampoa, are required within three days to start off home. " All the foreigners and foreign women are instantly to leave" (Macao).

Enclosure 25 in the above letter; page 28 of additional papers. (52 pages.)

To this communication Captain Elliot again replied that he was not aware who had caused the death of Lin Weihe, and that the five men * who had been found guilty of rioting had been sent home to receive their punishment of imprisonment and fine: and asked for time to translate their Excellencies' orders, as they were of great importance.

Enclosures 27-29 in the above letter; pages 31-37 of additional papers. (52 pages.)

This reply provoked a retort that whatever was contained in their Excellencies' commands was always of importance, and further orders followed fast; the Macao Magistrate and Commissioner's Deputy communicating commands from the Commissioner on the 27th October, and the Commissioner and Governor announcing further orders direct to the Superintendent upon the same day.

The tenor of the Commissioner's orders to his Deputy and the Macao Magistrate will appear from the following passage:—" That the English foreigners," he said, " should not be allowed hastily to return to Macao. I have in repeated instances " declared, and commanded, and urged their speedy expulsion. How can you still " prefer a request for their return, stating that all these foreigners say that all things " are now arranged agreeably to my commands? Let it be asked, are the bonds " given? Is the murderer delivered up? Of other matters I say nothing. I require " that they be speedily, and with severity, driven out. Suffer no longer delay or " addition to their numbers, that you bring not investigation on yourselves also."

In their orders issued direct to Captain Elliot, the Commissioner and Governor explained at some length the objections, (which were undoubtedly serious), to the scheme for unloading and searching vessels outside the Bocca Tigris. In the first place, as they said, there were not enough Chinese boats in the river for the purpose. Secondly, the operation would be tedious and difficult, and goods would be certain to suffer. And thirdly, the ships would not be able to spare men enough to look after their property, when on its way in Chinese boats from the Bocca Tigris to Canton. " We, the Commissioner and Governor," they continued, " loving and compassionating " all the foreigners, and being unwilling that they should suffer this loss, therefore " resolved to arrange for them a mode of operation, by which such as would execute

* The men were released on their arrival in England, in accordance with an opinion, expressed by the Law Officers of the Crown to the effect that it was doubtful whether Captain Elliot had the power to sentence them to imprisonment in England. Hansard's Parliamentary Debates. 3rd Series, Vol. 53, page 1,133.

" the bond in the form prescribed should be allowed to escape the search, thus " leading them in a path, short and convenient, and showing them the full weight of " faithfulness and justice. Such a disposition would we extend, indeed, to all the " foreigners; but these foreigners still will not understand, and are willing to " undergo the trouble of being searched. And when we examine what are their " stupid and obscure thoughts, we find only that they regard as ill-looking the " words 'the parties immediately executed.' They will not consider that when " 'execution' is spoken of, it is in sole reference to those persons who bring opium. " If they, indeed, bring none, what obstruction or difficulty can there be to the execu- " tion of the bond? Thus Daniell, having executed the bond and sent his ship to " Whampoa, he was immediately at liberty to trade." . . . . . "The other " day, the said Superintendent joined to himself several foreign merchants, to repair to " Macao and deliberate. This would seem as though these men were such as had an " acquaintance with affairs, and that this was the cause of consulting them. But I " have heard that they had the daring presumption to carry forcibly their opinions, " that they were foremost in contumacy and opposition, and that they employed " coercion to prevent the smaller merchants giving the bond. How exceedingly " hateful is such perverse and obstinate exercise of compulsion! There can be no " doubt, from this, that they are depraved individuals engaged in the sale of opium. " We, the Commissioner and the Governor, before did indeed determine to give a " modified arrangement; but now, since we have become aware of these circumstances, " we assuredly cannot bear with their contumacy and trifling. Those foreign " merchants, who went to Macao, to lord it in the deliberations, being unwilling to " give the bond, all of them must be refused permission to trade, and be compelled " to take their departure to return to their countries."

Four foreign vessels, they said, had recently visited Kwanghai, contrary to the regulations; and in an affray, which had occurred, one Chinese had been killed, and three wounded, and the pig-tails of seven others had been cut of; and then, on the appearance of the war junks, the foreign vessels had escaped and returned to Hong Kong. Three foreigners also had been seized for selling opium off Hainan, and had admitted upon examination, that the Captain of the "Hercules," a British ship, was engaged in an extensive traffic in the drug. Captain Elliot, therefore, was ordered to ascertain and report the names of the foreigners, who had killed and wounded the Chinese at Kwanghai, to enable them to inflict punishment, and also to surrender the Captain of the "Hercules" for examination and trial.

" For the rest," they concluded, " the traitorous Chinese on board the foreign " vessels, we find more numerous the more we inquire. Before we commanded that " they should be given up, and the said Superintendent gave it no thought. It seems, " for the most part, that these foreigners cannot be aroused or influenced by good " words. And we, the Commissioner and the Governor, have no course left but to " send out war vessels to proceed to Hong Kong, to surround and apprehend all the " offenders, those connected with murders, and those connected with opium, as well as " the traitorous Chinese, concealed on board the foreign vessels. We take occasion " distinctly to make this known to enable you to be prepared. We, the Commissioner " and the Governor, conduct affairs open to the broadest light of equity, and are not " willing to come on any unexpectedly."

Letter from Captain Elliot to Captain Smith, dated 27th Oct. 1839; pages 11 and 12 of additional correspondence. (14 pages.)

This was practically a declaration of war; and on the 27th October Captain Elliot wrote to Captain Smith, who was then off Macao in the "Volage," calling his earnest attention to the menacing character of the communications, which he had received from the authorities, repudiating the arrangement effected in regard to the trade; informing him that he had received credible information to the effect that the Chinese Admiral had assembled a considerable force at the Bocca Tigris, and was contemplating measures of hostility against the merchant ships with the ostensible object of seizing the murderer of Lin Weihe; and suggesting that Her Majesty's ships should be moved to the anchorage below Chuenpee, and that Captain Smith should submit in his own name "a moderate but firm address" to the Imperial Commissioner and Governor, as the only possible means of averting some "sudden disaster." "Upon the " other hand," he added, "this measure will enable you to judge of the actual extent " of preparation, and of the readiness to attack; and if it be intended, as I am " strongly disposed to believe, Her Majesty's ships can be in no more suitable or " imposing situation for effectually repelling such aggressive purposes, than in the " sight of the batteries, and under the immediate observation of the Commissioner."

Letter from Captain Smith to Captain Elliot, dated 28th Oct. 1839; page 12 of additional correspondence. (14 pages.)

Captain Smith replied, on the 28th October, that he had observed, with considerable uneasiness, the erection of batteries and the increase of the Chinese force in the vicinity of Hong Kong, and the military preparations at Macao, and was of opinion that a firm and decided stand should be made against any further encroachments. He concurred as to the advisability of submitting propositions direct to the Imperial Commissioner at the Bocca Tigris, and expressed himself ready to proceed to Chuenpee for the purpose. Captain Elliot accordingly joined him; and the "Volage" and H.M.S. "Hyacinth," which had also arrived in China, started for Chuenpee, where they arrived on the 2nd November.

Address from Captain Elliot to the Imperial Commissioner and Governor of Canton, dated 29th Oct. 1839; page 37 of additional papers. (52 pages.)

Before leaving Macao, Captain Elliot replied briefly, on the 29th October, to the communication from the Commissioner and Governor of the 27th October. "Elliot," he wrote, "has received the communication of their Excellencies, dated on the 27th "instant, containing the statements of outrages committed upon the coast, which "have filled him with sorrow and shame. He, again and again, declares that the British "Government will give no protection to the men of his nation pursuing these guilty "and sordid practices. But concerning these spoken of Elliot knows nothing. They "have not taken place within the circle of his authority; and he can solemnly aver "that he has used his best efforts to prevent them, wherever his power extends. It "is utterly false to say that he has given these, or any other shameful deeds, his "countenance. Concerning all other matters touched on in their Excellencies' "communications, Elliot has already replied fully."

Letter from Captain Elliot to Lord Palmerston, dated 5th Nov. 1839; pages 8-10; and Enclosure 3 in the letter; page 13 of additional correspondence. (14 pages.)

At Chuenpee the British ships were anchored about a mile below the first battery, where an imposing force of Chinese war junks and fire-ships was assembled, and a Lieutenant and Mr. Morrison, the Chinese Secretary, were sent on the 2nd November to the Admiral's junk, with an address from Captain Smith to the Imperial Commissioner and Governor, submitting for their consideration the following propositions:—

First.—That they should forthwith publish a proclamation, withdrawing the orders issued for the destruction of the British merchant ships by war junks and fire-ships in three days, because the commanders had not signed bonds, which they could not execute "consistently with the laws of their own country."

Second.—That the British merchants and their families should be allowed to reside on shore without fear of seizure, and should be furnished with servants and supplies, until the commands of the Queen of England should be "received for "the adjustment of all difficulties, agreeably to the principles of peace and "reason."

The Lieutenant and Mr. Morrison were civilly received; and the Admiral promised to forward the address to the Commissioner and Governor, who were then in the neighbourhood, and to send an answer the following day. He also expressed a wish that the ships should move a little further down the river; and this Captain Smith immediately did.

In the evening a linguist was sent to the British ships with a verbal message, requesting that Mr. Morrison might be sent to the Admiral's junk; but a reply was given to the effect that Captain Smith's address contained all that was to be said, and until it was answered, Mr. Morrison could not be allowed to attend.

In the forenoon of the 3rd November a Chinese junk, with an officer on board, anchored at a short distance from the British ships, and the linguist was again deputed to request that Mr. Morrison might be sent. The request, however, was again refused; and about the same time the Chinese squadron, consisting of 29 junks, stood out towards the British ships, which immediately got under weigh and advanced to meet them.

Captain Smith to the various Commanders of war junks, dated 3rd Nov. 1839; page 13 of additional correspondence. (14 pages.)

The Chinese, on seeing this, anchored in good order; and Captain Smith sent by the linguist a brief communication addressed to the Commanders, requiring them to withdraw to their former anchorage. "Smith," he said, "commanding the British "naval force, hereby sends information to the various Commanders. He has per-"emptorily to request, that all their vessels instantly return to the anchorage north of "Shakok. It will be well so to do."

Reply by the Chinese Admiral to the above communication, dated 3rd Nov. 1839; page 13 of additional correspondence. (14 pages.)

This communication was delivered to the Admiral, who was commanding in person; and in a short time he sent back by the linguist the following reply: "The linguist "having returned on board, all that he had to represent for you has become known to "me. At this moment, all that I, the Tetuh (Admiral), want is the murderous "foreigner, who killed Lin Weihe, a single individual. If Elliot will name a period

" in which he will deliver up the murderer, I, the Tetuh, will be in no way appre-
" hensive in my requirements. As soon as a time is given in which the murderer
" shall be delivered up, the force can be immediately drawn back to the Bogue.
" Otherwise by no means whatever will I accede. This in reply."

The linguist also brought back Captain Smith's address to the Commissioner and Governor, and a sealed order addressed to the Commander of the ship on board of which the five prisoners, sentenced to imprisonment for participation in the fatal affray, had been confined.

The Admiral's reply showed plainly that the Imperial Commissioner was determined upon hostilities, unless some individual should be surrendered for execution, in atonement for the death of Lin Weihe; but Captain Elliot addressed to him the following final communication:—"Elliot again and again solemnly repeats that he knows not
" the murderer of the native Lin Weihe; that he should have been punished, if he
" had been discovered; and that he shall be punished, if he be apprehended. Elliot
" is a sincere lover of peace, and is not responsible for the consequences of present
" proceedings."

Letter from Captain Elliot to the Chinese Admiral, dated 3rd Nov. 1839; page 14 of additional correspondence. (14 pages.)

Captain Smith was not disposed to retire in the presence of a force which (in Captain Elliot's words) had been "moved out with the palpable intention to intimidate;" and thought that the Chinese should not be left at liberty to slip by the ships of war in the night and attack the merchantmen at Hong Kong. He accordingly, with Captain Elliot's concurrence, gave the signal for attack and the British ships opened fire. The engagement, which followed, was of short duration. In less than three quarters of an hour, four of the Chinese junks had been destroyed, or sunk, and several were waterlogged; and the Admiral, who had personally displayed much bravery and spirit, retired with the remainder of the squadron to his former anchorage. The damage done to the British ships was slight. Captain Smith did not oppose the Admiral's retreat; and made sail for Macao to cover the embarkation of British subjects and to make provision for the safety of the merchant ships. The moderation displayed was, however, thrown away upon the Chinese; who, as Sir John Davis tells us, misconstrued Captain Smith's motives for not entirely destroying the squadron, and claimed that they had gained a victory upon the occasion.

Letter from Captain Elliot to Lord Palmerston, dated 5th Nov. 1839; pages 8-10 of additional correspondence. (14 pages.)

Sir John Davis' "China."

Arrangements were made for the embarkation of British subjects wishing to leave Macao on the evening of the 3rd November; and Captain Elliot then proceeded with Captain Smith in the "Volage" to Hong Kong, leaving the "Hyacinth" at the Portuguese settlement.

At Hong Kong, the Chinese brought some troops and guns to the neighbourhood of the anchorage and opened fire on the ships; and although the fire was ineffectual, and the troops might easily have been dislodged, Captain Elliot and Captain Smith were both anxious to avoid any further measures of hostility. To safeguard the ships, however, from any possibility of surprise, Captain Elliot insisted on their removal, much against the wish of the Commanders and underwriters, from Hong Kong, to a safer anchorage at Tongkoo Bay. No trade was permitted after the affair at Chuenpee, and the transhipment of cargoes from American vessels was prohibited by the Chinese.

Letter from Captain Elliot to Lord Palmerston, dated 7th Nov. 1839 and Enclosures; pages 39-42 of additional papers. (52 pages.)

Sir John Davis' "China."

The Imperial Commissioner and the Chinese authorities, as might have been expected, absolutely refused to admit the mistake, which had been made in regard to the "Bilbaino." The appeal of the consignee for redress was met with a flat denial of the truth of his allegations, and with an injunction to the Portuguese to seize him, and forward him to the Commissioner for exemplary punishment. The Spanish mate and Manilla seaman were taken from the Bocca Tigris to Canton with chains round their necks, and the mate was there induced by threats and promises to sign a false declaration to the effect that the vessel, though she was Spanish at the time of her destruction, had belonged to the British and had been sold by them to the Spaniards.

Letters from Captain Elliot to Lord Palmerston, dated 16th Nov. and 6th Dec. 1839; pages 3-5 and 45-47 of additional papers. (52 pages.)

In a letter to Lord Palmerston, dated 16th November 1839, Captain Elliot made a defence of his conduct in regard to the case of Lin Weihe and the opium traffic.

"I have proceeded," he wrote, "to the uttermost verge of my authority, if I have
" not exceeded it, in the attempt to discover and bring to justice the murderer of this
" innocent native, and in my deep public and private anxiety and distress, that con-
" sciousness is a support to me. The Commissioner's accusations to the contrary
" occasion me no uneasiness, and I am, in like manner, unaffected by his charge of
" countenancing the illicit traffic in opium.

"If my private feelings were of the least consequence upon questions of a public
" and important nature, assuredly I might justly say that no man entertains a deeper

Letter from Captain Elliot to Lord Palmerston, dated 16th Nov. 1839; pages 3-5 of additional papers. (52 pages.)

" detestation of the disgrace and sin of this forced traffic on the coast of China than " the humble individual who signs this despatch.

" I see little to choose between it and piracy; and in my place, as a public officer, " I have steadily discountenanced it by all the lawful means in my power, and at the " total sacrifice of my private comfort in the society in which I have lived for some " years past.

" But whilst I have endeavoured to fulfil my duty to Her Majesty's Government in " the public course of repression I have pursued, it did not consist with my station " to sanction measures of general and undistinguishing violence against Her Majesty's " officers and subjects; and to a mode of working out objects, right or wrong, which " set all the obligations of moderation and justice at defiance."

The despatches submitted by Captain Elliot, reporting the circumstances under which the opium was surrendered, and the British merchants withdrew from Canton to Macao, reached England on or before the 21st September 1839; and several demands for settlement of claims on account of the opium were made upon the Treasury at the end of October and beginning of November.

Communications between the Board of Treasury and the holders of Bills or certificates granted by the Chief Superintendent at Canton for opium surrendered: presented to Parliament on the 23rd March 1840.

Correspondence between Her Majesty's Government and the East India Company regarding the expedition for service in China; submitted to Parliament on 15th April 1840.

Hansard's Parliamentary Debates; 3 Series, Vol. LIII. From 24th March to 11th May 1840, pages 6–11.

Page 920 of the above volume of Hansard.

Her Majesty's Ministers were not at first disposed to accept the responsibility thrust upon them by Captain Elliot in regard to the opium; and on the 11th November 1839, the claimants were informed that no funds were available for the payment of compensation, and that the Government had no intention of submitting to Parliament a vote for the payment of any such claims. A demonstration, however, was decided on; and orders were issued, on the 4th November 1839, for the despatch of a naval expedition to the China Seas; and, on the 3rd April 1840, when the Government was in possession of the accounts of the proceedings, which followed the withdrawal of the English from Canton up to the time of the naval engagement at Chuenpee and the removal of the merchant ships to Tongkoo Bay, an Order in Council was issued authorising the Commanders of Her Majesty's ships of war to seize and detain Chinese vessels and cargoes, so as to compel the Chinese Government to grant satisfaction and reparation for the proceedings of its officers at Canton.

Some of the merchants also, whose opium had been surrendered, petitioned Parliament; and on the 24th March 1840, Mr. Crawford brought forward a motion in the House of Commons for the appointment of a Select Committee of the House to inquire into the subject of their grievances. Her Majesty's Ministers had at this time, (as stated by Lord John Russell), decided to include, in their demands upon the Chinese Government, an "indemnity for the loss of the property" of British subjects "incurred by threats of violence," and the motion was not opposed. On the 3rd April, a Committee was nominated, which comprised among its members Lord Palmerston, Sir Robert Peel, and Mr. Gladstone; and on the 1st May, the correspondence relating to China, which had been presented to Parliament, and the Reports of Committees of the House upon the China Trade, and upon the affairs of the East India Company in 1830–32, were referred to it for consideration.

Report from the Select Committee of the House of Commons on the China Trade, dated 5th June 1840, with Minutes of Evidence.

The Committee examined a certain number of witnesses, (among whom were Mr. Robert Inglis and Mr. Jardine), but little additional information of value was elicited, and no conclusion was arrived at; the Report, which was submitted on the 5th June, 1840, being to the following effect:—" That your Committee feel that they shall best " discharge their duty by laying before the House, without any observation on their " own part, the evidence which they have taken upon the subject."

The opium trade, Captain Elliot's proceedings, the paucity of the instructions issued to the Superintendents by Her Majesty's Government, and the lawless conduct of some of the British residents in China, offered ample opportunities for hostile criticism; and the war was unpopular with many people in Great Britain.

Hansard's Parliamentary Debates; 3 Series, Vol. LIII.

An attack upon the Government in the House of Commons was led by Sir J. Graham, who moved, on the 7th April 1840, the following Resolution:—" It appears to " this House, on consideration of the papers relating to China, presented to this " House by command of Her Majesty, that the interruption in our commercial and " friendly intercourse with that country, and the hostilities which have since taken " place, are mainly to be attributed to the want of foresight on the part of Her " Majesty's present advisers in respect to our relations with China, and especially to " their neglect to furnish the Superintendent at Canton with powers and instructions " calculated to provide against the growing evils connected with the contraband traffic " in opium, and adapted to the novel and difficult situation in which the Superintendent " was placed."

A long debate ensued. Mr. Gladstone, Sir Robert Peel, and several others spoke in support of the Resolution, and vigorously assailed the Government, which was eloquently defended by Mr. (afterwards Lord) Macaulay, then Secretary for War, Sir J. Hobhouse, President of the Board of Control, and Lord Palmerston. Mr. Charles Buller also made an effective speech in defence of the Government, and several other members spoke on both sides. Sir J. Graham's motion, as Sir R. Peel said, did not pronounce any opinion as to "the opium trade, nor as to the policy and justice " of the war;" but it offered an opportunity for an attack upon either or both, and the opium trade was strongly denounced by Mr. Gladstone and Viscount Sandon, and also by Sir George Staunton and others, who supported the Government. The necessity for war, or at least for a demonstration of force, was however generally recognised. Even Mr. Gladstone, who said that the war was more unjust in its origin and more calculated in its progress to cover the country with permanent disgrace than any he had ever read of, admitted that the despatch of an armament was required. The country, as he said, had been placed by the Ministers in such a position that it was a matter of certainty that terms of equity could not be demanded without a display of force. Sir Robert Peel also stated clearly, that he was not prepared to deny the necessity for a hostile demonstration. The attack, in short, was made more upon the real or supposed mistakes of the Government in the past than upon the measures which they contemplated in the future.

Captain Elliot's conduct met with more approval than condemnation. Mr. Gladstone, though he censured some of his proceedings, said, "that in the discharge of " his duty he had throughout shown great courage, and in some part of it great tact " and discretion;" and the other members who spoke in support of the Resolution, as Lord Palmerston observed, were, with few exceptions, more inclined to approve than to criticise. Lord Palmerston himself said that Captain Elliot had made a signal exhibition of "zeal, courage, and patience."

The division on the Resolution, which took place on the 10th April, resulted in a majority of nine in favour of the Government.

In the course of his speech, in this debate, Lord Palmerston stated frankly, that he did not believe, that the motive of the Chinese Government, in prohibiting the importation of opium, was "the promotion of the growth of moral habits." "The fact " was," he said, "that this was an exportation of bullion question, an agricultural " interest protection question. It was the poppy interest in China, and the practical " economists, who wished to prevent the exportation of the precious metals, that led " the Chinese Government to seek to put down this contraband trade in opium."

Mr Gladstone also, (it is important to observe), remarked that there was a "broad " and marked distinction" between the opium trade "as carried on before September " 1836, and as carried on subsequent to that period." "A Report," he said, "of the " Committee of the House of Commons had referred to the former period, and he " could imagine that in the lax state of morals, which there prevailed both in this " country, and in China, with respect to the smuggling of opium, that that Committee " should have been unwilling to enter on the subject of the suppression of the opium " trade, when it was supposed that the Chinese themselves were not in earnest in their " desire to put it down. The quantity of opium raised and exported to China was, " however, at that time much less than it had subsequently been. The trade had not " then taken the enormous spring which it had since done; and besides, there was at " that time a power in the supracargoes enabling them to put a stop to the opium " trade whenever they might see necessary to adopt such a course, and that power it " was the intention of Parliament to continue by the Act of 1833."

In the House of Lords the debate which took place turned more directly upon the opium trade, Earl Stanhope, on the 12th May 1840, moved the following Resolution, denouncing the trade and deprecating the war: "That an humble address be " presented to Her Majesty to express to Her Majesty the deep concern of this House " in learning that an interruption has occurred in the friendly relations and commercial " intercourse which have so long subsisted with the Chinese Empire: and to represent " to Her Majesty that these calamities have, in the opinion of this House, been " occasioned by British subjects having persevered in taking opium to China, in direct " and known violation of the laws of that Empire; and to require that Her Majesty " will be graciously pleased to take immediate measures for the prevention of such " proceedings, which are so dishonourable to the character and so detrimental to the " interests of her subjects: and to assure Her Majesty that if any additional powers " should be found requisite for the purpose, this House will readily concur in granting " them to Her Majesty."

Hansard's Parliamentary Debates: 3 Series Vol. LIV. From 12th May to 22nd June 18

Hansard's Parliamentary Debates: 3 Series Vol. LIII., pages 1158 and 1159.

In his speech, Earl Stanhope, who had admittedly presided at a public meeting at which it was resolved to send certain strongly-worded resolutions to the Emperor of China through Commissioner Lin, vindicated the sincerity of the Chinese Government in regard to the prohibition of opium, urged that British subjects were bound to respect that prohibition whatever might be its motive, and made what Lord Melbourne described as "a most severe, bitter, and in many respects "unjustifiable attack upon Captain Elliot," whom he apparently regarded as a friend of the opium traders. His protection of Mr. Dent, his appeal to the Portuguese Governor of Macao, the affair at Kow Lune, the proposed blockade of the port of Canton, even his proceedings in regard to the case of Lin Weihe—all were condemned, and his conduct was said to have been characterised by a want of frankness and good faith.

Lord Melbourne replied on behalf of the Government. He agreed that the British Government and British subjects had no right to inquire into the sincerity of the Chinese Government, or to question its motives for the prohibition of the importation of opium, but pointed out the objections, which existed, to any co-operation on the part of the British Government in the enforcement of such a prohibition. "The law "of that country being known," he said, "it should be respected, and no country "should encourage or abet in its subjects the violation of the laws of another. At "the same time, it was matter of question, how far one country could enforce the "prohibitory laws of another, and how far the Government of the one could prevent "the violation particularly of the fiscal revenue and protective laws of the other."

He admitted that the opium trade had been the immediate cause of the rupture, but observed that the trade had been carried on and increased by the connivance of the Chinese authorities at Canton; and, in defending the Government, defended also Captain Elliot, who had, as he said, "conducted himself throughout with the greatest "coolness, ability, and judgment."

The Duke of Wellington supported the Government, and moved, as an amendment, the previous question. He was not satisfied as to the sincerity of the Chinese Government in regard to the prohibition of opium, and was doubtful how far the interruption of amicable relations had been due to this cause; and described Lin's proceedings as "an insult and injuries, such as he believed had never been before inflicted on this country." He passed also a warm enconium upon Captain Elliot's courage and self-devotion.

Earl Stanhope, when moving the Resolution, declared his intention of pressing the question to a division, however small the number might be, who were prepared to vote with him. He met, however, with no support. Lord Lyttleton and others, who spoke, were ready enough to admit that there had been faults on both sides, but held that under the circumstances war was inevitable, and that whatever might have been the merits of the quarrel in the first instance, the Chinese had put themselves in the wrong by Lin's proceedings subsequent to the seizure of the opium; and the Duke's amendment was agreed to without a division.

A description of the war is not required in this narrative, but some of the leading incidents may be briefly referred to. The first expedition despatched from India arrived in China in the summer of 1840; and a blockade of the port of Canton was declared in the month of June. The force then moved northwards, and Chusan was occupied on the 5th July. In the month of August Captain Elliot, who was associated with Rear-Admiral Elliot, as Joint British Plenipotentiary, proceeded to Taku, at the mouth of the Peiho River; and, after some discussion, Keshen, the Governor-General of Chihli, was deputed to negotiate with him at Canton. Rear-Admiral Elliot was compelled by illness to leave China in the month of November, and Captain Elliot became sole Plenipotentiary. Negotiations were commenced, but the intentions of the Chinese were secretly hostile; and in January 1841 a discovery of their perfidy led to the immediate capture of the forts at Chuenpee and Tykoktow. A cessation of hostilities followed, and a Treaty was negotiated by Keshen, which provided for the cession of Hong Kong, the payment of an indemnity of six millions of dollars, the establishment of direct official intercourse upon equal terms, and the immediate resumption of trade. Chusan was evacuated by the British troops in consequence of this arrangement.

Letter from Captain Elliot to the Earl of Aberdeen, dated 25th June 1842; presented to Parliament in March 1843; "China," 1; Sir John Davis; and Narrative of the Combined Naval and Military Operations in China," by W. D. Bernard, Esq., 1844.

The Treaty was repudiated by the Emperor; Keshen was degraded; and the Chinese troops were ordered to "root out the rebellious barbarians." Hostilities were accordingly resumed at Canton; and the forts at the Bocca Tigris were captured by Sir Gordon Bremer on the 26th February 1841. The British squadron then moved up the river. A fortified position at the first bar was stormed, and the river-side

defences of Canton were carried; but the city was not occupied, and on the 20th March an armistice was concluded, and terms were agreed to by Captain Elliot, which enabled the trade of the season to be disposed of. The Chinese, in the meantime, continued their military preparations, and the suspension of hostilities was temporary only. On the 21st of May another collision occurred, and the riverside defences of Canton were carried a second time, and the heights above the city were occupied by the British troops, under Sir H. Gough. The city, however, was again spared, though the people showed plainly that they were not cowed; and a Convention was concluded, which provided for the immediate payment of six millions of dollars as the ransom of the city, and for a further payment of 80,000*l.* as compensation for the burning of the "Bilbaino" and for losses sustained by British subjects in consequence of the destruction by the Chinese of the foreign factories at Canton; for the evacuation of the city by the troops from other Provinces and the departure of the Imperial Commissioners; and for the resumption of foreign trade upon the withdrawal of the troops. The trade at Canton appears to have been continued, in accordance with this Convention, without serious interruption, throughout the subsequent operations.

Sir H. Pottinger, who had been appointed to the charge of affairs as Minister Plenipotentiary by the British Government in May 1841, arrived at Canton in the month of August. Captain Elliot, who was superseded, returned to England; and from this time more effectual measures were taken to compel the Chinese Government to submit.

The scene of hostilities was transferred to the north-east coast. Amoy was taken, and the island of Koolangsoo, which commanded the town and harbour, was held by a British garrison. Chusan was occupied a second time on the 1st October 1841; and the army of the Tartar Governor Yukien, who had distinguished himself by flaying alive the master of a British ship, who had fallen into his hands, was routed with great slaughter at Chinhae. Ningpo was captured without resistance on the 13th October.

A period of comparative inactivity followed, and at the commencement of March 1842 the Chinese were emboldened to attempt an attack upon the British force at Ningpo. The attack was, however, easily repulsed, and the British troops resumed the offensive. The Chinese army of Chekeang was defeated at Segaon; the defences at Chapoo and Woosung were successively carried without much difficulty, and the British force, consisting of 15 ships of war, 10 steamers, and above 50 transports, then proceeded up the Yang-tse-Keang River. Chinkeangfoo, which guarded the openings of the Grand Canal below Nankin, was stormed on the 20th July, after a more determined resistance than had up to that time been offered. The defending force, which was composed of Manchu Tartars, lost heavily, and the British had more men killed than in any of the previous engagements. On the 4th August the "Cornwallis" flagship anchored off Nankin; and, on the 10th, the disembarkation of British troops was commenced.

The Chinese had by this time profited by experience, and Commissioners Keying and Elepoo, who were both men of ability and moderation, were appointed to sue for peace. During the negotiations some symptoms were shown of vacillation, and preparations were made for an attack upon Nankin. The Chinese, however, gave way, and an honourable treaty of peace was signed, on the 29th August 1842, on board the "Cornwallis" by Sir H. Pottinger and the Chinese Commissioners.

The principal provisions of the Treaty were:—

Treaty between Her Majesty and the Emperor of China, signed in the English and Chinese languages at Nankin, on the 29th August 1842, with other documents relating thereto, presented to Parliament in 1844.

British subjects were permitted to reside, with their families, and trade at the five ports of Canton, Amoy, Foochowfoo, Ningpo, and Shanghai; and Superintendents, or Consular Officers, were to be appointed at each of the ports. The Hong monopoly was to be abolished at Canton; and the Chinese Government agreed that no system of the kind should be introduced at the other Treaty ports, and that British subjects should be allowed to carry on their business, at all the ports, with any persons they pleased. Three millions of dollars, which were due from some of the Hong merchants at Canton to British subjects, were to be repaid by the Chinese Government.

Hongkong was ceded in perpetuity to the British Government, to be governed by such laws and regulations, as should be thought fit.

The Chinese Government agreed to pay an indemnity of twelve millions of dollars on account of the expenses of the British expedition, in addition to the six millions already paid as ransom for the city of Canton; and to pay the "sum of six "millions of dollars as the value of the opium, which was delivered up at Canton in "the month of March 1839, as a ransom for the lives of Her Britannic Majesty's

"Superintendent and subjects, who had been imprisoned and threatened with death "by the Chinese High officers."

A fair and regular tariff of export and import customs and other dues was to be established and promulgated for general information at each of the Treaty ports, and British goods, paying import duty in accordance with the tariff, were to be admitted to any province or city in the interior of China, on payment of a further amount of transit duty; which, by a subsequent declaration, signed on the 26th June 1843, (on the day that the Ratifications of the Treaty were exchanged at Hongkong,) was not to be raised above the rates then existing.

The forms of address to be used in official correspondence between representatives and officials of the two nations were fixed and prescribed.

The twenty-one millions of dollars were to be paid as follows: six millions at once, six in 1843, five in 1844, and four in 1845.

The troops were to withdraw from Nankin on payment of the first instalment and on receipt of the assent of the Emperor to the treaty; and Koolangsoo and Chusan were to be held until the money payments and arrangements for opening the ports should be completed.

In regard to opium, as will be observed, the only stipulation in the treaty was that, which provided for the payment of an indemnity of six millions of dollars for the opium delivered up at Canton.

In the instructions issued to Rear-Admiral Elliot and Captain Elliot on the 26th February 1841, and to Sir H. Pottinger on the 31st May 1841, Lord Palmerston directed them to endeavour to obtain the legalisation of the opium trade, so as to prevent in the future the possible interruption of friendly relations between the two countries by opium smuggling. The instructions, which explain very clearly the attitude of the British Government in regard to the trade, are reproduced below *in extenso*:—

"Viscount Palmerston to Rear-Admiral Elliot and Captain Elliot.

"Gentlemen,

Letter from Lord Palmerston to Rear-Admiral Elliot and Captain Elliot, dated 26th Feb. 1841; page 1 of Papers relating to the Opium Trade in China, 1842–1856 presented to Parliament in 1857.

"Her Majesty's Government having taken into their consideration the circumstances connected with the China opium trade, I have to instruct you to endeavour to make some arrangement with the Chinese Government for the admission of opium into China as an article of lawful commerce. In bringing this matter before the Chinese Plenipotentiaries, you will state that the admission of opium into China, as an article of legal trade, is not one of the demands, which you have been instructed to make upon the Chinese Government; and you will not enter upon the subject of it in such a way as to lead the Chinese Plenipotentiaries to think that it is the intention of Her Majesty's Government to use any compulsion in regard to this matter.

"But you will point out that it is scarcely possible that a permanent good understanding can be maintained between the two Governments, if the opium trade be allowed to remain upon its present footing.

"It is evident that no exertions of the Chinese authorities can put down the trade on the Chinese coast, because the temptation, both to the buyers and to the sellers, is stronger than can be counteracted by any fear of detection and punishment. It is equally clear that it is wholly out of the power of the British Government to prevent opium from being carried to China; because, even if none were grown in any part of the British territories, plenty of it would be produced in other countries, and would thence be sent to China by adventurous men, either British or of other nations. But the present state of the Chinese law upon this matter makes the trade illegal; and illegal trade is always attended with acts of violence, both on the part of those who are employed to prevent it and on the part of those who are engaged in conducting it.

"But battles between Chinese war junks and British smugglers have a necessary tendency to produce unfriendly and embarrassing discussions between the British and the Chinese Governments; or, at all events, to keep alive hostile feelings between the British and the Chinese people. It would seem, therefore, that much additional stability would be given to the friendly relations between the two countries, if the Government of China would make up its mind to legalise the importation of opium upon payment of a duty sufficiently moderate to take away from the smuggler the temptation to endeavour to introduce the commodity without payment of duty.

"By this means, also, it is evident that a considerable increase of revenue might be obtained by the Chinese Government, because the sums, which, are now paid as bribes to the custom-house officers, would enter the public coffers in the shape of duty.

"I am, &c.

"(Signed) Palmerston."

## Viscount Palmerston's Instructions to Sir H. Pottinger respecting Opium.

"It is of great importance, with a view to the maintenance of a permanent good understanding between the two countries, that the Chinese Government should place the opium trade upon some regular and legalised footing. Experience has shown that it is entirely beyond the power of the Chinese Government to prevent the introduction of opium into China, and many reasons render it impossible that the British Government can give the Chinese Government any effectual aid towards the accomplishment of that purpose. But while the opium trade is forbidden by law, it must inevitably be carried on by fraud and violence: and hence must arise frequent collisions and conflicts between the Chinese preventive service, and the parties who are engaged in carrying on the opium trade.

Lord Palmerston ... ger respecting ... Papers relating ... Trade in China, ... presented ... in 1857.

"These parties are generally British subjects; and it is impossible to suppose that this private war can long be carried on between British opium smugglers and the Chinese authorities without events happening which must tend to put in jeopardy the good understanding between the Chinese and British Governments.

"Her Majesty's Government make no demand in regard to this matter, for they have no right to do so. The Chinese Government is fully entitled to prohibit the importation of opium, if it pleases; and British subjects, who engage in a contraband trade, must take the consequences of doing so. But it is desirable that you should avail yourself of every favourable opportunity strongly to impress upon the Chinese Plenipotentiary, and through him upon the Chinese Government, by all the arguments which will naturally suggest themselves to your mind, how much it would be for the interest of the Chinese Government itself to alter the law of China on this matter, and to legalise, by a regular duty, a trade which they cannot prevent."

Sir H. Pottinger, on the 27th August 1842, addressed a memorandum to the two Chinese Commissioners and to Governor-General Newkeen, setting forth these instructions, and pointing out that as long as there was a demand for opium in China, it was certain to be imported, and that prohibition of the cultivation of the poppy in British India, even if that were possible, would not prevent a trade in the drug from the Native States in India, or from other countries in which the poppy was grown.

Pages 1 and 2 of Papers relating to the Opium Trade in China 1842–1856; presented to Parliament in 1857.

The Chinese Commissioners, were unwilling to make any representation on the subject to the Emperor, and returned the following reply:—"On the withdrawal "of the prohibition against opium, it is not expedient at this time hastily to make any "representations to the throne. But the officers of China shall certainly be enjoined "to confine their jurisdiction in that respect to the soldiery and people of the country, "not allowing them to make use of it. Whether the merchant vessels of the various "countries bring opium or not, China will not need to inquire or take any proceedings "with regard thereto."

Page 3 of the above Papers.

## Conclusion.

The preceding narrative is believed to be absolutely fair and impartial. Its object is to state facts, and any lengthy discussion of the causes of the war, or of the question how far the British Government and British subjects were to blame in connexion with it, would be out of place. In a matter also, which has been the subject of so much controversy, and upon which statesmen of such eminence differed so widely in their views at the time when the occurrences were fresh in memory, my personal opinions can hardly be of any consequence. The nature of the conclusions arrived at is, however, briefly indicated in the following paragraphs.

The opium trade was undoubtedly the immediate cause of the rupture between the two countries, though the attitude of the British Government towards the Chinese and towards opium was such that, if the Chinese Government had pursued a less violent and aggressive policy, hostilities might easily have been averted, even after the compulsory surrender of the opium owned by British subjects.

The measures, first taken by Lin to obtain the surrender of opium then on the coast of China, can conceivably be defended on the supposition that he did not intend to do more than confine or imprison the traders; and personally I cannot help thinking that Captain Elliot had no sufficient justification for requiring the delivery to him of the opium for the service of Her Majesty's Government. If we leave out of sight his gallant and chivalrous conduct, his proceedings on the occasion appear to have been at variance with the instructions communicated by Lord Palmerston in June 1838, to the effect that any loss which British subjects might sustain in consequence of the more effectual execution of the laws of China

upon the subject of opium must be borne by themselves. It may of course be argued that Lin's proceedings were not in accordance with the laws of China; but the immunity, which foreigners had enjoyed, from the penal provisions of the Chinese fiscal laws, rested apparently more upon sufferance than upon any inherent or asserted right, and as nearly every foreign merchant in Canton was concerned in the opium trade, proceedings directed against them alone would not have been indefensible. The treatment accorded to the British Superintendent was, however, a national affront, which the Government could hardly have failed to resent.

Captain Elliot's "momentous circular" left three courses open to the British Government: to disavow his proceedings, to reinburse the merchants, who owned the opium, at the expense of the revenues of Great Britain, or to compel the Chinese Government to pay. As Lin's measures were a complete innovation upon Chinese practice, and, it may be said, upon Chinese law, it is hardly surprising that, when hostilities were forced upon the British Government, the third course was adopted.

The surrender and confiscation of the opium was not, moreover, the only cause of the rupture. The demand made by Lin for the execution of bonds, binding the executants to agree on behalf of all British subjects, at that time and in the future, to submit, at the discretion of the Chinese authorities, to the punishment of death and confiscation of ship and cargo, in the event of the importation of opium in any quantity, was one that could not possibly be complied with; and this demand operated as much if not more than the surrender of the opium to produce the hostilities, that followed. The Americans certainly executed the bonds, but they probably knew well enough that the submission thus yielded would be temporary, and that the course of events would ere long deliver them from the dangerous responsibility which they had assumed.

The demand also for the surrender of a British subject for trial (so called) by the Chinese for the murder of Lin Weihe, was one which Captain Elliot was justified in resisting to the utmost. The immunity from punishment for criminal offences which had been enjoyed by the British subjects in China for many years was deplorable; but the Chinese were responsible for the state of affairs thus created. They only claimed to exercise jurisdiction in cases in which a native had met his death at the hands of a foreigner, and their law on the subject of homicide was so brutal, and their administration of it was so glaringly iniquitous, that British subjects cannot be blamed for refusing to submit themselves to it. Difficulties of jurisdiction prevented the effective establishment of British Courts of Criminal justice in China. Negotiation might have removed these difficulties, but the Chinese Government would not negotiate.

Page 106 of the Correspondence relating to China; presented to Parliament in 1840.

"A case of homicide, as your Lordship is aware," wrote Sir G. Robinson to Lord Palmerston, on the 1st December 1835, "will be the event most fraught with difficulty "and anxiety . . . . . In the event of so unhappy a catastrophe occurring as the "death of a Chinese, we are helpless in Canton; we must give up a man or men, or "certain individuals in the first instance, and finally the officers of the Commission "are threatened, annoyed, insulted, and ultimately compelled to retreat without the "river, as in the case of the Company's factory in 1821–22, and then perhaps, and not "till then, is the affair brought to some termination."

See above, page 200

Notwithstanding the opinion expressed by Captain Elliot in his letter to Lord Palmerston dated 21st October 1839, regarding the negotiations in September and October of that year, it seems most improbable that a man of Lin's character would have ever relinquished the Chinese claim of a life for a life. He was imperious and resolute, and was not likely to have given way upon a point to which all Chinese attached so much importance. He might possibly have been satisfied with a subterfuge, but this even is doubtful; and no proceedings of the kind were possible in the altered state of affairs in China. Even in 1833, the Company's servants had faced the risk of an interruption of the Company's trade rather than appear to assent tacitly to such proceedings.

As to the other events, which immediately preceded hostilities, even if we acquit Lin and the other Chinese authorities of any participation in the cruel attack upon the "Black Joke," the burning of the "Bilbaino," admittedly on the supposition that it was an English ship, was an indefensible outrage, which alone would have justified a peremptory demand for reparation.

In the affair at Kow Lune, Captain Elliot certainly fired the first shot, but the complete stoppage of provisions was an act of hostility; and the notice regarding the poisoning of the water at Hong Kong, provoked, if it did not entirely justify, retaliation. Neither this incident, however, nor the projected blockade of Canton was of vital importance. The Chinese were evidently satisfied with their supposed

victory at Kow Lune; and the blockade was not once referred to by Lin or other Chinese officers during the progress of the final negotiations in September and October.

The negotiations do not require much notice. The consignee and captain of the "Thomas Coutts" acted, as British merchants in China often did, with a selfish regard for their own commercial interests, but Captain Elliot's scheme for carrying on the trade, outside the Bocca Tigris, contained the elements of failure.

On the 27th October, Lin practically declared war; and the naval engagement at Chuenpee, on the 3rd November 1839, was a necessary act of self-defence. The Chinese Admiral admitted in unmistakeable terms that he intended to seize "the "murderous foreigner, who killed Lin Weihe," by force.

In respect to the opium trade there is, as Mr. Gladstone pointed out in his speech in 1840, a great difference between the conditions, under which it was carried on, when the Select Committee of the House of Commons submitted their reports in 1830–32, and the conditions which existed when the Chinese Government had, after a period of vacillation, decided finally, in 1836 37, to put it down. This decision was for the first time communicated to the representative of the British Government in the summer of 1837, and the first communication, that can be regarded in any sense as official, was made in November of that year. Captain Elliot's letters on the subject of this communication, were received in England on the 15th May 1838, and Commissioner Lin arrived in Canton in March 1839. Allowing five months, therefore, for the transmission of a reply, the British Government had about five months to consider the question and take action, with any possibility of their action averting the impending rupture.

It is, perhaps, unfortunate that a Special Commissioner was not despatched, as proposed by Captain Elliot, to discuss the opium question and other matters with the officers of the Chinese Government; but the contemptuous dismissal of Lord Amherst's embassy, and the manner, in which the communications of the Local Government at Canton were made to the Superintendent, were not calculated to encourage the British Government to attempt further negotiations with the Court at Pekin. Captain Elliot himself also, when recommending the appointment of a Special Commissioner, clung to the idea that the trade would be eventually legalised, and Her Majesty's Ministers were even at this time distrustful of Chinese sincerity.

The remarkable growth of the opium trade subsequent to 1830, which forced the subject upon the notice of the Chinese Government, was not a matter for which either the Government of Great Britain or the Government of India was responsible. If the Indian Government had succeeded in its attempt to restrict the export of opium from the Native States, the quantity of Indian opium, reaching China, might have been permanently regulated and restricted.

The Chinese Government was, apparently, sincere in the first instance in prohibiting the importation of opium, as an article which was believed to be injurious to morals and health: but the connexion between the opium trade and the exportation of sycee silver, and the growing audacity exhibited by the foreigners, were the motive causes that induced the Emperor and his advisers to attempt in earnest to suppress the trade. Otherwise the interdict against opium would probably have remained, like the Imperial edicts which were issued against tobacco, a luminous, but useless, manifestation of Celestial benevolence. The extensive production of opium in the western province of Yunnan, which was referred to by Choo Tsun in 1836, appears to have been accepted with comparative equanimity.

The question, how far the British Government would have been justified in restricting the liberties and curtailing the pecuniary profits of its own subjects in India, and of the Rulers and subjects of feudatory States in that country, from a desire to meet the wishes of the Chinese Government, and how far such a policy, if adopted, would have been practically possible, is one upon which no opinion is expressed, owing to the circumstances under which this narrative has been written.

In respect to the more remote, but not less important causes of the war, it is necessary to remember that the interdict against opium was not the only law of the Empire that was disregarded and violated by our countrymen in China. Bringing foreign women to Canton, riding publicly in sedan chairs, the distribution of religious tracts, and the employment of native servants were all serious offences in the eyes of the Chinese: and the defiant attitude assumed by the Select Committee of supracargoes in 1829–32 and Lord Napier's proceedings in 1834 were eminently calculated to offend and alarm a haughty and suspicious government. Lin's measures at Canton were taken in pursuance of a deliberate policy, and were evidently intended to reduce the

foreigners to submission and to enforce obedience in the future to the laws and regulations of China in other matters as well as to suppress the trade in opium.

The following observations made by Mr. Charles Buller in the debate in the House of Commons in 1840 are worthy of reproduction. "The conclusion," he said, "at which he "had arrived after the perusal," (of all the recent publications relating to China,) "was, "that no sagacity on the part of Her Majesty's present Ministers could have averted, "or even staved off, what seemed to him to be the inevitable consequences of free "trade with China established on the footing on which we placed it in 1833 . . . "Faults there had, undoubtedly, been on both sides, for he must frankly say that "he was by no means convinced that the Chinese had been the only parties to blame; "but the faults on our side had been faults of the general policy pursued by us as "a nation. Our error dated from that period, when, having determined to throw open "the trade to all our countrymen, we left it on a footing in which it was utterly "impossible for it to continue with either honour or security. He would not say "that we were wrong in taking away the East India Company's monopoly of the "China trade; but if we were right in that, we were very wrong in not perceiving "that that step was calculated to disturb all our existing relations with the Chinese, "and we were wrong in not making that complete change, in our whole mode of carry-"ing on the trade which ought to have accompanied the one that we did make. He "must confess that when he looked back to the change which we made in 1833, and "considered the footing upon which that change placed our relations with the "Chinese, he could not but regret that our information at that time was so incomplete, "that we did not perceive that continued and serious collision must be the immediate "result of the position in which we placed ourselves."

In a few words, the withdrawal of the East India Company's monopoly made war, sooner or later, inevitable. As Mr. W. S. Davidson, the senior partner of one of the two leading private firms then at Canton, told the Select Committee of the House of Lords in 1830, the country had then before it two alternatives: to give up drinking tea, or to insist upon the establishment of an amicable, reasonable, and mutually advantageous intercourse. A continuance of the Company's monopoly might possibly have prevented the war. The advantages which the Company derived from the China trade were so great, that the Directors were content to compel their servants to submit to much personal humiliation, and the extensive powers, possessed by the Select Committee, enabled them to control and keep in order the private traders. The supracargoes, however, were human, and the Company had often great difficulty in maintaining peace.

In 1833 the Government decided, with the assent of Parliament, that the powers possessed by the Select Committee should be continued to the Superintendents; but when it came to practice it was felt intolerable that any officer of Government should have the power of deporting, at his discretion, any British subject, or of ordering away any British ship from the Chinese coast.

It was not to be expected that British subjects, unaccustomed to such indignities in any quarter of the globe, should put up for ever with Chinese arrogance and insolence; and the commercial instincts of the nation, and the importance of the tea trade, precluded the possibility of withdrawal from so profitable and so necessary a market.

The circumstances, under which the collision eventually occurred, were not, it must be admitted, creditable to this country; but it is incorrect to say that the war was undertaken to force opium upon the Chinese.

R. M. DANE.

7th January 1895.

# APPENDIX D.

## Despatch from the Secretary of State for India to the Government of India.

### No. 7 (Revenue), dated 22nd January 1885.

### China—Chefoo Convention.

In continuation of my despatch No. 9 (Revenue) of 8th February 1883, and with reference to the telegraphic correspondence marginally noted, I forward, for the information of Your Excellency's Government, copy of correspondence which has passed on the subject of the negotiations with China on the opium question since the date of the despatch above cited.

*Secretary of State to Viceroy, dated 24th December* 1884.

Opium. Pedder's demi-official to Colvin of 10th October last. Chinese accept in effect Lord Granville's proposals of 27th April 1883, but insist on 80 taels. For political reasons I propose to agree. Have you any objection?

*Viceroy to Secretary of State, dated 3rd January* 1885.

Your Lordship's telegram dated 24th December. It should be made quite clear that British Government will have right to end arrangement at any time if Chinese Government fail to stop separate collection of li-kin; also that right of British Government to end engagement is not to depend on consent of other Treaty Powers. We think Chinese Government should have right to vary the duty for each port subject to the fixed maximum. In view of serious loss of revenue which we estimate at 25 lakhs of rupees minimum, and of uncertainty as to power of Chinese Government effectively to abolish internal collection of li-kin, we think 70 taels mentioned in your telegram of 6th December 1882, and agreed to in our telegram of 26th idem, sufficient concession, and we are consequently most unwilling to assent to proposed rate of 80 taels, finality of which, moreover, is very questionable.

1. Foreign Office letter of 17th March 1883, with accompaniment, being memorandum by the Marquis Tsêng, dated 12th March 1883.
2. India Office letter to Foreign Office of 29th March 1883.
3. Foreign Office letter of 16th April 1883, with annexure.
4. India Office reply of 25th April 1883.
5. Foreign Office letter of 30th April 1883, with two annexures, being memorandum and confidential note dated 27th September 1883.
6. Foreign Office letter of 8th December 1884, with annexure, being memorandum by the Marquis Tsêng, dated 27th September 1884.*
7. India Office reply, dated 28th January 1884.

2. These papers will fully inform Your Excellency of the present position of the negotiations. I have further only to explain, more fully than has been done in paragraph 4 of the letter to the Foreign Office, dated 20th instant, the reasons which have induced me to communicate to Lord Granville my assent to the conclusion of the agreement with China on the basis of a rate of 80 taels commuted li-kin, should His Lordship find that the negotiations cannot be brought to a satisfactory termination if that rate is not conceded.

3. In the first place, should the present negotiations fail on the question of the rate, the Chinese Government will be able to, and in their present financial position certainly will, impose upon Indian opium, as soon as it leaves the custom house at each port, the highest rate of li-kin it can possiby bear, perhaps 100 taels or more. This is distinctly intimated in the Marquis Tsêng's memorandum dated 27th September last. In that case, Indian opium will be burdened at least as heavily as it would be under the 80-tael uniform rate, and none of the advantages (free circulation in the interior, etc.) will be secured, which that arrangement would give it. On the other hand, China would not obtain the advantages she anticipates from the proposed arrangement of her whole opium revenue being levied by one Imperial Department, of the li-kin revenue being taken out of the hands of the Provincial Governments, and of prevention of smuggling. Her Majesty's Government would therefore be represented as in the invidious position of refusing to China an arrangement which would benefit her, while not securing any real advantage to the Indian revenue.

4. Next, the calculation contained in paragraph 5 of this office letter to the Foreign Office, dated 20th instant, is based upon figures for the five years ending 1880–81, the last period for which there is any information as to the amount of the Chinese li-kin revenue. The gain to China which that calculation shows has probably been to some extent discounted by subsequent enhancements of the local rates of li-kin, which it is known have been effected in several places. It is thus possible that the actual increase of the Chinese taxation of Indian opium over the taxation which it now bears, and the consequent injurious effect on the Indian revenue, will be less than is anticipated by your Government, and I may remind your Excellency that Sir T. Wade has always been of opinion that Indian opium would bear a uniform rate of 110 taels (including tariff duty): Sir R. Hart, of over 120 taels, without the import being seriously diminished. It is not then, I think, certain that the difference of 10 taels in the uniform rate will cause so large a loss to India as is anticipated by your Excellency. But even should this loss

* In China Papers 5 of 1885 (C.—4735) the date is given as 30th September.

amount to so large a sum as 25 lakhs annually, it appears to me worth while to incur this sacrifice in order to settle the opium question with China for at least five years: to give greater security to the future opium revenue, now in some danger on account of troublesome political questions which would be disposed of and to protect the in trade Indian opium against unequal, unexpected, and oppressive enhancements of the local li-kin duties.

5. Again, it will be seen from the Marquis Tsêng's memorandum of March 12th, 1883, that the Chinese Government consider the commutation of opium li-kin a necessary preliminary to the abolition, which they have in contemplation, of li-kin on goods other than opium. It is true that no engagement is made that this measure will be immediately carried out. But the argument makes it difficult to refuse to accede to arrangements which are represented as indispensable to the contemplated reform. That reform is a measure which has always been urged upon China by the other Treaty Powers, especially by Germany and France, and it would be unfortunate that Her Majesty's Government should appear to be standing in its way. It would also be beneficial to the trade of the United Kingdom with China, and it is not desirable that Her Majesty's Government should be represented as preventing it for the sake of the Indian opium revenue.

6. Finally, the anti-opium agitation in this country, already serious and likely to be yet more formidable in a new House of Commons, is a factor in the present question to be taken into grave consideration. For some time past the leaders of that movement in Parliament have been chiefly insisting on the injustice of preventing China from doing what she desires as regards the taxation of Indian opium. If the present Chinese proposals are accepted, the answer to this argument will be obvious and conclusive. You will observe that the Chinese Minister's memoranda of March 12th, 1883, and of September 27th last, admit unreservedly that the agreement now under negotiation is of the Chinese Government's own proposing and includes all that they desire. But should the negotiation be broken off on the question of the amount of the uniform rate, an answer would not be easy to frame, and I need not remind your Excellency that the adoption by the House of Commons of a resolution, such as has been repeatedly moved, condemnatory of your opium revenue, would prove embarrassing to your Government.

7. For these reasons, and because I am strongly of opinion that, if this opportunity is allowed to pass, the chance of settling the opium question in concert with China is not likely to recur, I have decided, after careful consideration of the arguments adduced in your telegram of 3rd January, upon the course stated in paragraph 2 of this despatch.

(Signed) KIMBERLEY.

# APPENDIX F.

# SUBJECT INDEX.

## A.

ADEN:

Indian opium imported, 1855–56 to 1880–81, ii. 391.

ADULTERATION:

Opium often adulterated fraudulently; also by careless manufacture, 5035.
Native vendors in Assam said to adulterate opium, 10,184, 10,189–95; licensed vendors prosecuted for adulteration, 10,480, 10,481.
Vendors increase their profit by adulteration, 13,040, 13,043.
Opium liable to adulteration, 16,097.
Pure, unadulterated opium is seldom procurable, 18,894.
Petition against adulteration by Excise opium contractors, 19,093.

ADVANCES TO CULTIVATORS:

Natives would not cultivate poppy if advances stopped, 738, 940.
Advances sometimes resolutely refused, 739.
Not given for any other crop, 994–98.
Few cultivators would grow poppy if not tempted by advances, 2767, 2844.
Only differ from other advances in being free from interest, 2921, 2927.
Paid direct to cultivators, 3259, 3260.
For well-making, 3305, 3310.
Interest on advances, 5133–42, 5152–55.
50 lakhs advanced every year, 5254, 5268.
People willing to take the advance, but sometimes dilatory in fulfilling contract, 5519–34.
System gives special advantages to tenants, 6187.
To a certain extent unfavourable to the cultivator, 9293.
Agricultural loans, 10,795, 10,807, 10,808.
Tempt poor cultivators to grow poppy, 11,047–51, 11,197, 11,444, 15,071, 15,115, 15,194, 15,396–401, 15,470, 15,524.
Main advantage of poppy growing, 12,118–21.
Government advances loans at 6 per cent., 11,288.
Money-lenders would charge 12 per cent., 11,289–93.
Ryots apply for advances of their own accord, 12,346.
Form of notice that advance has been sent and cultivation will be required, 11,489.
Enable ryots to pay rent for other lands as well as poppy, 12,075–77, 12,085, 12,346.
Repayment enforced too strictly, 12,084, 12,085; difficult in bad seasons, 12,085.
If withdrawn, would lead to abolition of cash rents, 12,172.
Form of agreement in Behar, 12,255–67.
Must be repaid if poppy not grown, 12,346, 12,360–68.
Meet the requirements of the ryots, 12,848.
Advantageous to the cultivator, 13,414, 13,446.
Keep ryots out of debt, 13,447–49.
Form of agreement, 13,560.
Form practically contrary to common law, 13,561–68, 13,639, 13,647.
Punishment clause never enforced, 13,569–75, 13,580, 13,582.
Issue of notice threatening prosecution, before signature of contract, illegal, 13,593–98, 13,615, 13,616.
If withdrawn, cultivation would be less popular, 14,011–14, 14,034, 14,042, 14,043, 14,049.
Come just at the time when money wanted for payment of rent, 14,400, 14,409–12, 14,419, 14,432–36, 14,451, 14,452, 19,312.
Taking advance is perfectly voluntary, 14,802.
Reduction of advance would tend to gradual extinction of poppy cultivation, 19,143.
Great attraction to poorer cultivators, 19,535.
Ryots saved from exorbitant demands of village money-lenders, i. 134.
System in Behar and Benares, ii. 320.
Construction of permanent and temporary wells, *ib.*
Statement showing advances to opium cultivators, 1887–88 to 1891–92, ii. 398.

ADVANCES TO CULTIVATORS—*continued.*

Amount compared with actual cost of opium delivered, 1882–83 to 1891–92, ii. 446.
Correspondence regarding terms of document by which advances to opium cultivators for the construction of wells are secured, v. 139.

*See also* CULTIVATION, OPIUM DEPARTMENT.

AFIMCHI:

*See* AFIM-KHOR.

AFIMI:

Term of reproach applied to opium sots, 2262, 2357–63, 9977, 14,516, 15,509, 15,547, 15,671, 16,561, 16,580, 16,718, 18,210, 18,361.
Applied to lazy people continually in a narcotic state, 19,066, 25,227–31.
Applied to all opium-eaters, 23,382.
Means opium-eater who goes to excess, 24,331.

AFIM-KHOR:

Opium-eaters—a term of reproach, 5840, 5898, 5914, 5938, 8613, 9259, 9328, 11,017, 11,041–43, 11,224, 11,949–51, 12,665, 18,254.
Relate to consumers of large quantities, 27,476, 27,573.

AFRICA, EAST COAST:

Indian opium imported, 1855–56, 1867–68 to 1893–94, ii. 390.

AGE WHEN HABIT CONTRACTED:

Habit largely confined to persons over 40, 2706.
Habit acquired in early life, 2796–99.
Habit acquired between 16 and 18, sometimes earlier, 3035.
Not usually commenced until vital powers are failing, 3490, 3516.
Generally commenced after the age of 35, 3775, 3831–33, 3860.
Many commence after 35 or 40 years of age, 3891, 3943, 3963, 4491, 4518, 4559.
Habit generally acquired about 40, 4038, 4991, 8443, 8537, 8538, 16,082, 16,083, 16,219, 16,984, 18,903, 18,909, 25,508, iv. 378.
Opium-eating generally commenced after 20, 4559.
Habit generally acquired between 30 and 40, 5826, 6021, 10,725.
Generally acquired after middle age, 6107, 8600, 8637, 8638.
Smoking generally commenced between 15 and 20, 7232.
Chinese commence to smoke from 15 to 25 years old, 7399.
Generally begun about middle age, 8785; sometimes earlier, 8786.
Generally acquired among the Muttucks between 10 and 15, 10,490.
Generally acquired about 25, sometimes earlier, 11,679, 27,827.
Habit generally acquired at 20, 13,012.
Mostly commenced between 18 and 20 for very bad purposes, 14,554.
People who take opium for cold take it between 35 and 50, 14,689.
Usually commenced between 20 and 30, 15,754, 15,881.
Habit should not be commenced before 30, 16,491.
Habit generally acquired from 35 to 40, 17,350, 26,023.
Coolies begin smoking about 12, sometimes earlier, 18,354.
Jats do not take opium until 40, 18,455.
People generally begin after 40, 18,795, 18,819.
Eating begun between 30 and 40, smoking between 20 and 30, 17,139, 19,729.
Habit usually acquired between 25 and 30, 19,901.
Rajputs begin to take opium at 25 to 30, 20,698.

AGE WHEN HABIT CONTRACTED—*continued.*

Rajputs begin habit after 35, 21,111.
Kathis begin habit at 18 or 20, 22,577.
Habit generally contracted at 20, 22,875.
Great many begin between 20 and 25, 23,507.
Few known to begin habit before 25, 24,904.
Habit generally contracted between 35 and 40 by males, 25 and 30, or earlier, by females, 25,396.
Women generally commence habit about 30 for some ailment, 25,858.
Smoking generally commenced between 15 and 25, 27,184, 27,273.

AGE OF CONSENT:

*See* PRECEDENTS.

AHMEDABAD:

Consumption of opium by different races, 23,608, 23,656, 23,681, 23,750, 23,776, 23,823, 23,863, 24,215, 24,234, 24,312, 24,425, 26,019.
Smoking prohibited; generally confined to bad characters, 24,429–47.

AJMERE:

Expenses per acre, gross value, and net profit to cultivator of poppy and other crops, 21,750, 21,751, iv. 402, 403.
Chandu shops closed, but smoking still carried on and almost impossible to detect, 21,754.
Arrangement for supply and sale of opium, ii. 353.
Number of shops, consumption, and receipts, 1883–84 to 1892–93, *ib.*
Opium excise in Ajmere-Merwara, iv. 402–4.
Cultivation of poppy, iv. 402.
Restrictive measures, iv. 403.
Opium brought to Ajmere scales, iv. 404.
Impossible to check possession unless cultivation, &c., were prohibited in adjoining Native States, *ib.*

ALCOHOL:

Consumption in China, 198, 199, 204, 768–70; in Japan, 203.
Consumption of spirits increasing, 723–27, 24,225, 24,286.
Should be prohibited as well as opium, 729, 9910–14, 9953, 27,258–63, 27,349, 27,518.
Consumption of spirits by the Chinese in Hong Kong, 1438–43, 1745.
Few physicians prefer opium, 4721.
Greater dietetic value than opium, 5900–3.
Drinking tends to stop opium-smoking, 7060.
Importation should be prohibited, 9305–11.
Should be prohibited, 10,513, 11,077–80, 11,459–62, 14,052, 15,656, 18,046, 22,821, 23,827, 26,441, 26,499–501, 26,518, 27,696, 27,851, 27,860, 28,015, 28,173, 28,210.
Better to prohibit it than opium, 13,866.
Should be stopped altogether, 16,714.
Sale should be restricted like opium, 18,964, 18,975–78.
Restrictions on opium should be extended to alcohol, 21,369–73.
Preferred to opium as a stimulant by the new generation, 22,769–73.
Public opinion not ready for a prohibitory law, 23,342.
Should be prohibited if possible, 23,370.
Traffic in alcohol as an intoxicant should be stopped, 23,460, 23,512.
Consumption is increasing especially in cities, 23,692, 23,757–60, 23,800–7, 23,868–71.
Prohibition is out of the question, 24,130.
Should be prohibited before suppression of opium, 24,301, 24,327, 24,543, 24,985, 25,250.
Taking place of opium in most places, 24,551.
Much more important to stop alcohol than opium, 24,587.
Consumption by Europeans and Eurasians in Bombay less than 25 years ago, 24,683.
Great deal of drinking among Natives in Bombay, 24,699.
Higher wages tend to increase liquor drinking, 24,867.
Prohibitive policy should be adopted, 25,525, 25,746.
Consumption in Poona increasing every year, 26,064–69.
Excessive consumption should be repressed, 26,244.
Consumption is increasing through relaxation of religious restrictions, 26,417–20.

ALCOHOL—*continued.*

Facilities for consumption should be restricted, 26,431–33.
Traffic should be stopped by local option, 26,540.
Public will agitate until it is prohibited, 26,551–58.
Gradually but surely replacing opium habit, 27,141.

*See also* LIQUOR TRAFFIC, OPIUM *v.* ALCOHOL, PROHIBITION.

AMAL PANI:

Opium dissolved, purified, and mixed with spices, 20,213.
Used at Rajput ceremonies and social gatherings, 20,982, 20,987, 20,990.
Used in excess by wealthier Rajputs, 21,945.
Regular parties invited to drink, 21,961–65.
Daily excessive use causes stupidity, 21,967.

*See* CEREMONIAL USE, DECOCTION, KASUMBHA, SOCIAL USE.

ANGLO-INDIAN AND WESTERN EURASIAN ASSOCIATION OF INDIA:

Views on the opium question, 27,147–57.

ANIMALS:

Cattle given opium as a stimulant, 226.
Horses of Sindh go 60 miles at a stretch under influence of opium, 1918.
Injection of morphia during German long-distance ride produced similar results, *ib.*
Given opium when extra exertion required, 20,421.
Given to horses, bullocks, and camels when much work is expected from them, 20,990, 21,590.
Opium used as a common remedy, 21,577, 21,590.
Opium not given to animals in Malwa, 21,990.
Given to domestic animals in certain diseases, 23,261.
Opium poppy seeds and heads used for cattle, 23,874, 24,116.
Use of opium in medical treatment, v. 127.

ANTI-OPIUM MOVEMENT:

State of feeling in England, 25–39, 46–53, 351–55.
Opium question in the United Kingdom, 54, 55; in foreign countries, 56–59; 139–43.
Agitation based on moral grounds, 449.
Errors due to prevailing ignorance of Indian affairs, 872.
Experience in India proves absolute inaccuracy of anti-opium contention, 1153.
British action as to opium in China has been misrepresented, 1256, 1257, 1262–69, 1275–78.
Various contentions of the anti-opium people combated, 1285, 2936–39.
Comparison with anti-tobacco movement, 1810–20.
Views on monopoly system, 2069.
Strange views on Chinese currency, 2073, 2074.
Financial views of the party in England, 2117–19.
Memorial on the opium question, 2399–588.
No case has yet been made out, 2913.
Alleged change of front with regard to monopoly, 2987.
Criticism of the Society's objects, 3195.
Has failed to distinguish between smoking and eating opium, *ib.*
Discussion of opium question, 4303.
Agitation in India chiefly active in Bombay, 8669–71.
Statements in House of Commons nothing less than cant, 8676.
Vindication of position taken up by the Association by appeal to action of Government abolishing religious customs in India, 20,021–24.
Prohibition advocated to remove obstacles to spread of Christianity in China, 22,201.
Evidence refutes the sensational descriptions of the evils of the traffic, 22,385.
Agitation appears to be based on insufficient moral grounds, 22,496.
Letter to Society giving reasons for declining to sign petition, 25,876.
Reasons for destroying the Indian opium industry, i. 136.
Moderate party only desire severance of Government connexion with opium industry, i. 144.
Founded on misleading reports of missionaries in China, i. 146.
Memorial presented in November 1892, i. 162–5.
Memorial of the Calcutta Missionary Conference, ii. 314.

ANTI-OPIUM MOVEMENT—*continued.*

Account of previous proposals for abolishing the Government monopoly, ii. 371–83.
Agitation, a mere sentimental outpouring of rhetoric, ii. 411.
Case against Chinese trade fails when tested by facts, ii. 444.
Suggestions of the Society would confer no benefit on China, whilst India would suffer irreparable injury, *ib.*
Agitation based on insufficient grounds, ii. 439.
Prejudice against opium founded on ignorance, v. 154.
Address to the Chinese Ambassador, with his reply, v. 361, 362.

APHIMI:

*See* AFIMI.

APHRODISIAC:

Use of opium and other stimulants, 1165, 1166.
Opium commonly used, 2593, 2689, 2690, 2757, 4639, 8637, 8729, 8805, 9320, 10,725–27, 13,191, 13,278, 13,993, 13,994, 14,039, 15,046, 15,147, 15,149, 15,490, 16,560, 16,902, 17,283–86, 17,496–99, 17,612, 18,210, 18,294–98, 19,904, 20,047, 20,342, 21,878, 21,907–10, 25,656, 27,004, iv. 379.
Opium taken to stimulate the sexual appetite, 3455, 3464.
Not used in Malwa as an aphrodisiac, 3801, 3802.
Sometimes taken as an aphrodisiac, 5827, 18,819.
Extract from a Sanskrit medical book, 8984.
Opium excites the sexual passions, 11,844–50, 26,427.
Opium mostly used, 12,654, 12,659, 12,674, 12,675; not so much used as strychnine, 12,700–703, 15,147, 15,149.
Fails to act as a stimulant after a few days, 15,158–65.
Very few take opium to increase virile power, 18,795.
Believed to be a stimulant to sexual passions, 18,927.
Youths take it with the idea of increasing virile power, 18,957.
Sometimes taken shortly after puberty to remedy evil results of dissipation, 20,278, 20,287, 20,311.
Statement that opium used for vicious purposes is incorrect, 20,286, 20,310.
Not much used as an aphrodisiac, 21,418.
Harmful through leading to excessive sexual intercourse, 22,385.
Opium supposed to restore failing virility, 22,579.
For one person who uses opium, thousands use milk and strong food, incantations, prayers, &c., 24,862.
Does more lasting good to old than young people, 25,396.
Mistaken popular notion that opium is an aphrodisiac, 25,951.
Acts as an aphrodisiac as age advances, 26,711.
Opium-smoking is a wonderful aphrodisiac, 27,186–95.
Lecherous persons take opium as a stimulant, 27,828.

*See also* SEXUAL EFFECTS.

ARAKANESE:

Evil effects of opium, 6652.
*See* BURMANS.

ARMY:

Increase of military expenditure, 917–22.
Expenditure cannot be reduced, 2058–60.
Expenditure should be reduced, 11,217–19.
Large establishment now unnecessary, 11,316–21.

*See under* FINANCE.

ASSAM:

Riots at Nowgong not entirely due to opium prohibition, 3154–60.
Cultivation prohibited in 1860, 5126.
Opium-eating universal, and poppy cultivation free at date of annexation, 8009.
Production of evidence, 9029–31, 9629–54.
Rough analysis of the population, 9680–95.
Riots among tax-paying opium-eaters, 9591–620, 9704–7, 9743–49, 9833–38.
Mortality at the tea gardens, 10,067–71, 10,107, 10,108, 10,162, 10,163.
Riots caused by stoppage of opium cultivation, 10,337–57, 10,362, 10,380, 10,382.
Despatch, dated 31st May 1862, respecting riots at Nowgong, ii. 459.
Sketch of Assam, extract from, v. 354.

ASSAM ADMINISTRATION:

Historical account of opium administration, 8987–9031, ii. 454.
Arrangements for supply and sale of opium, ii. 348.
Number of shops, issues, and receipts, 1883–84 to 1892–93, *ib.*
Number of licenses, consumption, receipts from opium, and population, 1873–74 to 1892–93, ii. 455.
Provincial system of excise, ii. 456.

—— CONSUMPTION:

Consumption of opium by Mikirs and Hozais, 3025–34, 3169.
Consumption of opium, 3669–73, 4303–8, 9080–106, 9143–52.
Consumption of opium during the last 10 years, 9564–68.
Consumption of opium, 1874–75 to 1889–90, ii. 447.
Population, consumption of opium, and chief opium-eating races, ii. 458.

—— LICENSING:

Auction system in Assam, 8991–98.
Effect of reducing number of shops is to restrict consumption, 9519–22.
Licenses generally granted for localities where habit is common, 10,501, 10,554–66.
Excise system does not tend to restriction, 10,540–42.
Upset price for a shop in Assam, 10,561–63.
License for retail sale of opium, ii. 457.

—— LIQUOR TRAFFIC:

Undue facilities for purchasing spirituous liquors, 10,210–20.

—— POLICY:

Special restrictions to check excess of consumption, 2077.
Increased production, 5118–19.
Policy of suppression, 5119, 5126, 5143–46.
Results of Government policy, 9518–22.
Government policy to restrict consumption, 9580–90, 9701–3.
Consumption should be stopped gradually, to suit altered condition of people, 10,238, 10,258, 10,259, 10,305.
Policy of Government tends to decrease use, 10,362, 10,390.
Government arrangements certainly increase consumption, 19,286.

—— PREVALENCE OF HABIT:

Twenty-five per cent. of the population use opium, 8594.
Opium-drinking pretty common in Assam, 9511, 9512.
Statistics of opium consumers, 9513–15.
Opium more common in Upper than Lower Assam, 9843–46.
Kacharis only take opium in the malarial parts of Assam, 10,167–69.
Climate is such that some stimulant is required, 10,176.
With increased sanitation and spread of education, use of opium likely to diminish, 10,392, 10,464–67.
Widely prevalent among the Assamese, 10,488, 10,489.
Per-centage of excessive consumers, about two-thirds, 10,493, 10,514–18, 10,582–86.
Ten per cent. of the people eat opium, 19,290.
Consumption not confined to any race, ii. 461.
Miris and other tribes who work for Europeans are all opium-eaters, *ib.*
Opium, an article of everyday use, *ib.*

—— PRICE:

Complaints about exorbitant price in Assam, 9591.
Increased price, or taxation, decreases use of the drug, 10,362, 10,370, 10,390, 10,392.
Price more than an ordinary cultivator can afford, iii. 227, *Note.*

—— SALE:

Particulars of sale of opium, 10,207.

ASSAM, SHOPS:
Chandu and madak smoking on licensed premises, 3057, 3079-98, 3130-46.
Closing of shops for sale to be consumed on premises, 9556-63.
No opium dens, such as described by Mr. Caine, in existence, 9556-59, 9572-79.
Number of licensed shops, 1873-93, 9700.

—— REVENUE:
Loss from prohibition could be met by retrenchment, 9055.
Recent increase of the land revenue, 10,043-51, 10,160, 10,161.
Loss proposed to be met by curtailing expenditure, 10,506.

—— SMUGGLING:
Smuggling from Naga Hills, 5619-26.
Could not be prevented in Assam if cultivation prohibited, 9023, 9552, 9696, 9717.
Illicit cultivation and smuggling, 9546-55, 9670-76.
Could not be prevented unless the Excise Department would maintain an army of subordinates, 10,206.
Could not be effectually prevented if opium prohibited, 10,362.
Stringent preventive measures would lead to complications with frontier tribes, *ib.*
Prohibition would lead to any amount of smuggling, 10,458-62.

—— TAXATION:
Additional taxation undesirable, 9964, 10,018-23.
Nothing short of armed force would persuade Assamese to pay tax to replace opium revenue, 10,038, 10,099, 10,145.
Land-tax increased 30 per cent., 10,208, 10,260.
Consequently people could not bear any additional burden caused by prohibition, 10,261.
Recouping loss by increase of land revenue unjust, 10,362.
Increase of opium duty would gradually reduce consumption, 10,392-94, 10,422, 10,463.
Agitation about the enhancement of the land revenue, 10,605-10.

—— VENDORS, LICENSED:
Distributed by tea-planters 20 years ago, 5590, 5609, 5632-38.
Licensees not allowed to receive goods in payment for opium, 9627, 9628.
Occasionally give information as to illicit trade, 9718, 9719.
Native vendors said to adulterate their opium, 10,184, 10,189-95.
Present excise system does not tend to spread the habit, 10,455, 10,456.
Vendors prosecuted for selling adulterated opium, 10,480, 10,481.
Shops in tea-gardens for sale to coolies, 10,757-76.

—— VENDORS, OFFICIAL:
English doctors, Native physicians, and inspecting officers of the Education Department could be entrusted with sale for medical use, 9057, 9058, 9107-12.
Sale by chemists would be more or less of a restriction, 10,400-3, 10,416-54, 10,468-72.
Sale should be entrusted to Mouzadars, 10,507, 10,508, 10,568-81.

ASSAMESE:
Want of energy not necessarily due to the opium habit, 9535-37, 9711-13.
Want of energy attributed solely to use of opium, 9882-93.
Largely given to opium habit, 9955-58, 9968, 10,488, 10,489.
Generally cultivators occupying their own holdings, and unwilling to work as day-labourers, 9980-10,005.
Disinclination to work attributed to opium rather than climate, 9999, 10,000.
Two-thirds take opium in one form or other, 10,145, 10,466, 10,514-18, 10,582-86.
Indolence owing to easy circumstances rather than to opium-eating, 10,514.

ASSAMESE—*continued.*
Cultivators generally occupy their own holdings, 10,522-26.
Unwillingness to take to day-labour historical, 10,529.
Opium-rag chewers very indolent, 11,689, 11,698.
Forty per cent. of the men and 10 per cent. of the women eat opium, 18,348.
About 50 per cent. of men, 20 per cent of women, and 30 per cent. of children smoke opium, 18,352.
Ten per cent. eat opium, 19,290.
Would have been extinct, as a race, without opium, ii. 460.
Skilled labourers and artisans nearly all consumers, ii. 461.

ASSOCIATION OF ASSAMESE STUDENTS:
Views in favour of prohibition, 9059-71, 9118-22.

AUCTION SALES:
Monthly auction sales at Calcutta, i. 134, 135.
Average sales for five years ending 1889-90, i. 135.
*See* SALES.

AUSTRALIA:
Indian opium imported, 1855-56 to 1876-77, 1891-92, ii. 335, 391.

B.

BAGHAT:
Consumption of opium, 16,179-87.
Cultivation free in Baghat, 16,191-93.
Unwilling to prohibit opium, 16,197, 16,265.
Export and import, 16,198.
Revenue from opium, 16,199-203.
*See also* NATIVE STATES.

BAHAWALPUR:
Consumption and cultivation of opium, 18,584-600.
Entitled to Rs. 23,000 per annum compensation, 18,593.
Arrangements regarding opium, ii. 357.
Agreement dated 1st April 1879, ii. 370.
*See also* NATIVE STATES.

BALA GOLI:
Sale of childrens' pills by Government in Bombay, 1922-46.
Formula for balagolis, 25,865.
Sale should be stopped, 26,619, 27,323.
Composition, 26,692.
Sale confined to a few places in Madras, iv. 435.
Note on childrens' pills, iv. 498.
*See under* INFANCY.

BALASORE:
Consumption of opium by the cultivating class, 4615, 4635-37.

BALUCHISTAN:
Arrangements for supply and sale of opium, ii. 350.

BANDHANI:
Term applied to moderate opium-eaters, 24,331.

BANSWARA:
Estimated loss to the State through prohibition, iv. 390.
Detail of annual loss, iv. 391.
*See also* NATIVE STATES.

BARLEY:
*See* SUBSTITUTES FOR POPPY.

BARODA:
Agreements respecting opium, ii. 352.
Quantity imported, 1883-84 to 1892-93, ii. 353.
Arrangements regarding opium, ii. 355.
Despatch from Sir T. Madava Row, 9th March 1878, ii. 358.

BARODA—*continued.*

Area under poppy, outturn, and imports of Malwa opium, 1891–92, ii. 335.
Memorandum regarding the prohibition of the import of opium, 1820, ii. 357.
Memorandum of . . . understandings arrived at as regards opium, 1886, ii. 358.
Production and consumption of home-grown opium, 1883–92, iv. 424.
Transactions in Baroda-grown opium, 1879–91, iv. 425.

—— COMPENSATION:

Not paid when cultivation stopped, 22,463–65, 22,483, 22,627.
No question of compensation in case of treaty rights, 22,495.
Impossible to ascertain amount, *ib.*
May be roughly estimated at 12 lakhs per annum, *ib.*, 22,567–69.
Estimated amount of compensation, 25,218–20.

—— CONSUMPTION:

Rate per head of population, 22,385, 22,576.
Average consumption of liquor and opium, 22,496.
Consumption of opium is not increasing, *ib.*
Castes that may be classed as consumers, 22,577, 22,628.
Does not appear to be decreasing with spread of education, 22,602.

—— CULTIVATION:

Area under poppy, 22,385.
Wheat and rape seed substituted when rates very low, *ib.*
Applications from cultivators in excess of requirements, 22,466–71.
No crop of anything near equal value, 22,496.
Popular with all classes, *ib.*
Confined to the Kari Division, 22,497–511.
Average yield per acre, 22,528–30.
Not allowed in Alamreli now, 22,585.
Was absolutely prohibited in 1803, 22,604–10.

—— EXPORT:

Traffic extinguished by arrangement with British Government, 22,385, 22,423, 22,512–18, 22,561.
Large quantities exported to China after 1857, 22,611.

—— FARMING:

System in vogue before 1878, 22,522–25.

—— LAND REVENUE:

Fixed cash settlement; poppy assessed as first-class land, 22,526.

—— MINIMUM VEND GUARANTEE:

System adopted to stop illicit dealings, 22,385.
System does not encourage consumption, *ib.*, 22,424.
Licensed vendors used to smuggle before system introduced, 22,438.
System does not lead to increase of illicit sales, 22,461.
Check against illicit practices, 22,672, 22,745.

—— MONOPOLY:

Bases of the State monopoly, 22,385.
System forced on the State, 22,493, 22,562–66, 22,615.
Opium passes through scale at Ahmedabad, 22,494, 22,514.
Use of chandu and madak made penal, 22,496, 22,533–39.
Administration under the system, 22,619.

—— PRICE:

Rates paid to cultivators, 22,448, 22,476–80, 22,531, 22,635.

—— PROHIBITION:

Any measure for suppression or reduction would be unfair and unwelcome, 22,385, 22,493.
Treaty rights cannot be interfered with, 22,385.
Cannot be extended to the Baroda State, 22,493.

BARODA, PROHIBITION—*continued.*

Would require a most expensive preventive force, 22,495, 22,632.
Would be ruinous to opium-cultivating ryots, 22,496.
Would pass over the opium consumer to the liquor seller, *ib.*
Must be left to education, moral persuasion, and, example, *ib.*, 22,540.
Unwarrantable interference with inherent rights, 22,581, 22,598.
Would be a very serious injury to cultivators, 22,626.
Impossible to entirely check poppy cultivation, 22,633.
People acquiesced in great reduction of area in 1883, being only a temporary measure, *ib.*

—— REVENUE:

Average annual revenue under the old system, 22,618.

—— SALE:

Retail sale for the last 10 years, 22,385, 22,425, 22,451.

—— SMUGGLING:

Opium smuggled from Malwa in spite of preventive establishment, 22,429–35.
Much less than there used to be, 22,678.

—— TRADE:

State monopoly helped to revive the opium trade, 22,385, 22,450, 22,493.
Speculative trade previous to 1878, 22,493.

—— TRANSIT:

Guaranteed on payment of full duty at Ahmedabad scales, 22,493.
Existing arrangements with British Government, 22,494.
Pass duty so high as to render foreign trade of little value, 22,559.

—— TREATIES:

Convention of 1820 with British Government respecting opium, 22,385.
Provisions of the Treaty of 1878, *ib.*, 22,493, 22,604.
Treaty arrangements with the British Government, 22,604.

*See also* NATIVE STATES.

BARSH:

Opium prepared according to prescription of Native physicians, 16,260.
Opium compound prescribed by Native Hakims, v. 124.

BAVASI:

Consumption of opium by different races in the district, 24,276.

BEHAR OPIUM AGENCY:

Behar Opium Manual, 3215.
Statistics of opium production, 11,172–331.
Economic condition, 11,214, 11,236, 11,246, 11,294, 11,296, 11,322–26.
Tenancy Act, 11,564–66, 12,064.
Ninety per cent. of the ryots have rights of occupancy, 12,070–74.
Area under cultivation, 12,167.
Poppy grown in almost every village in Gya, 12,375.
System of administration, 13,452–77. 13,508–647.
Table showing area cultivated, produce per bigha, outturn, amount paid to, and number of, cultivators, 1873–74 to 1892–93, ii. 325.
Map showing opium cultivation, ii. 337.
Area under poppy, 1882–83 to 1891–92, ii. 416.
Results of inquiry into allegations of undue influence in respect to poppy cultivation, v. 354–61.

BEIENYE:

Opium water; prohibited in Burma, ii. 463.

BEINCHI:

Opium clarified for smoking, 6466, 6467.
Poor Chinamen swallow it when unable to pay for smoking, 7007.
Pipe refuse, ii. 353.

*See* CHANDU.

BEINSE:

Opium clarified for smoking, 7169, ii. 353.

BENARES OPIUM AGENCY:

Poppy cultivation, 2899-903, 13,749, 13,750.
Table showing area cultivated, produce per bigha, outturn, amount paid to, and number of, cultivators, 1873-74 to 1892-93, ii. 325.
Map showing opium cultivation, ii. 339.
Area under poppy, 1882-83 to 1891-92, ii. 446.

BENGAL:

Area of poppy cultivation, 2086-100.
Consumption of opium, 2706, 2707, 3178-80, 9246-57.
Consumption for immoral purposes very limited, 3186.
Proportion of opium consumers, 4412, 4413.
Use of stimulants in Bengal, 4799.
Licenses for sale of madak and chandu, 4800, 4816-55, 4875-974.
General statement as to consumption of opium, 5460-62, 5467, 5480.
Licenses for opium-smoking, 1885-90, 5461, 5480.
Opium revenue, 5461, 5475-80.
Consumption of opium varies according to race, 11,887, 11,888.
Annual value of the poppy crop, i. 135.
Area under cultivation and cultivators employed, *ib.*
Area under cultivation, 1883-84 to 1892-93, ii. 344.
Outturn according to weightments, *ib.* 345.
Outturn of each factory of each kind of opium, *ib.*
Arrangements for supply and sale of opium, ii. 347.
Number of shops, issues, and receipts, 1883-84 to 1892-93, ii. 348.
Consumption per head, 1873-74 to 1892-93, ii. 428.
Statement showing population, number of licenses, consumption and revenue from opium, 1873-74 to 1892-93, ii. 428, 429.
Ditto (arranged by districts), 1892-93, ii. 434, 435.
Issues of opium to Excise and Medical Departments, 1882-83 to 1891-92, ii. 447.
License fees, and gain on excise opium, 1883-84 to 1892-93, v. 115.
Incidence of license fees per ser, 1891-92, v. 116.

BENGAL CHAMBER OF COMMERCE:

Review of the opium question, ii. 439-52.

BENGAL SYSTEM:

Views of the Anti-Opium Society, 463-97.
Government is a manufacturer, virtually also a producer, 882-84.
No substitute could be so effective in restricting consumption, 895.
State monopoly most repressive of all fiscal restrictions, *ib.*, 944.
Substitution of heavy export duty for monopoly would greatly increase consumption in India and China, 895, 976.
Would lead to enormously increased smuggling, 895.
Would be no different from moral point of view, *ib.*
Monopoly of opium no more objectional than monopoly of tobacco. *ib.*
Existing arrangements satisfactory, 1613, 4448, 8567.
Bengal system cannot be improved upon, 10,789, 10,962.
No change in existing arrangements necessary, 11,392.
Existing arrangements perfect, 13,430-33.
Consumption not stimulated by present system, 19,319-21.
Control and restriction better secured than under any other system, 19,530.
Misuse for Government to retain monopoly, 24,334.
Withdrawal from the Bengal system would place Government in a less obnoxious position, but might increase the evil, 27,039.
History of supply and sale of opium, ii. 425.
Account of previous proposals for abolishing the monopoly, ii. 371-83.
Sections of sale of Excise opium, i i. 427-35.
History of the monopoly in Bengal, ii. 445.

BENGAL SYSTEM—*continued.*

Monopoly: Arguments against and in favour of present system, ii. 450, 451.

*See also* MONOPOLY, OPIUM DEPARTMENT, POLICY, RESTRICTIVE MEASURES.

BERAR:

Prevalence of opium-smoking, 27,179-84, 27,263*a*-72.
Smoking shops still open, but people are cautious, 27,222-31.
Police doubtless aware of illicit practice, 27,232-35.
Ten per cent. of consumers smoke opium, 27,885.
Chiefly confined to lower classes, 28,016, 28,022.

*See* HYDERABAD ASSIGNED DISTRICTS.

BHANG:

More injurious than opium, 1100.
Opium decidedly less injurious, 4152, 4212.
Consumers considered dissipated, 17,069.
Not strong enough as a stimulant to please opium consumers, 22,936.

*See also* GANJA.

BHAUNAGAR:

Consumption of opium, 22,892, 22,908, 23,723, 23,737, 23,743.
Correspondence regarding the opium question, iv. 426-29.
Revenue from opium, 1870 to 1889-90, iv. 428.
Consumption of opium, 1878-79 to 1888-89, iv. 429.
Cases of smuggling tried, 1886 to 1890, iv. 430, 431.

*See also* NATIVE STATES.

BHIAN:

Opium pounded and strained through cotton, 21,128, 21,150, 21,156.

BHILS:

Take opium at social gatherings, 20,884, 20,990.
Would cause disturbance if opium prohibited, 21,641, 21,644.
Crime attributed to liquor drinking, 23,018.
Energy, endurance, and bravery not affected by use of opium, i 143.

BHOPAL:

Smoking not common in Bhopal, 21,944.
Yaddasht from H.H. the Nawab Shah Jehan Begam, 22,935.
Consumption of opium, 22,936.
Cultivation and capital invested in the opium trade, *ib.*, 22,945-47.
Treaty of 1813 with the East India Company, 22,936, 22,948.
Revenue rates on irrigated land, 22,939-41, 22,955-61.
Estimated loss through prohibition, iv. 407.
Statistics regarding opium, iv. 408.
Return of opium passed the scales, 1880-81 to 1892-93, iv. 415-17.
Abstract of evidence of witness not examined, iv. 422.

*See also* NATIVE STATES.

BILASPUR:

Consumption of opium, 16,380, 16,381.
Prohibition would prejudicially affect cultivators and entail loss of revenue, 16,382.
British Government would have to compensate Bilaspur State, 16,383.

*See also* NATIVE STATES.

BOHRAS:

Shia sect of Mahomedans in Central India; do not take opium, 21,812, 21,861, 21,883, 21,900.
Children are very unhealthy, 21,928-30.
Do not give opium to children, 21,948, 21,986, 22,034-38.

BOMBAY:
Restrictions on sale of poisons. 26,394–99.
Arrangements for supply and sale of opium, ii. 351.
Number of shops, consumption, and receipts from duty and license fees, 1883–84 to 1892–93, ii. 352.
Excise management of opium, 26,135, iv. 455–78.
History of the opium trade in Bombay, iv. 455–58.
Sources of supply, iv. 456.
Bombay opium rules, 1885, iv. 459–78.

—— CONFISCATION:
Offences followed by confiscation; disposal of things confiscated, and rewards for conviction, iv. 467.

—— CONSUMPTION:
Consumption of opium by the different races, 24,734–38, 24,748, 24,809, 25,100, 25,254, 25,824, 25,858, 25,883, 25,950, 25,985, 26,612, 26,775, 27,132, 27,288–96, 27,696, 27,722, 27,730.
Rate of consumption per head in each district, 1883–84 to 1892–93, 26,146.
Consumption of opium, 1879–80 to 1888–89, ii. 447.
Statistics of opium consumption, 1868–69 to 1872–73, iv. 479.
Opium passed into consumption, 1874–75 to 1882–83, iv. 480.

—— CONTROL:
Powers of officers, iv. 468, 469.

—— CULTIVATION:
Prohibited by Opium Rules, iv. 459.

—— DENS:
Frequented by dregs of the population, 1162–65, 1170.
Chiefly use illicit opium, 26,151, 26,169–71.
Very difficult to prove sale on premises, 26,212.
Law as to limits of possession no assistance, 26,213–16.
Abolition of licensed houses increased number of dens, 26,151, 26,273–75.
Private clubs should be put down and "dens" licensed, 26,174, 26,209, 26,217.
Abolition was a great mistake, 26,946–60, 26,988–91.
Has led to the establishment of private smoking-clubs, 26,948–51.
Unlicensed and uninspected smoking houses a great evil, 26,988.
Visit to opium dens, 27,282, 27,284, 27,318.
*See* SHOPS.

—— DUTY:
Rates of duty imposed from time to time (1818–90), iv. 456.
Duty on imported opium, iv. 465.

—— EXPORT:
Rules for export, transhipment, and re-export, iv. 462, 463.
Pass for transport through British territory, iv. 476.
Pass for import into, transport through, and export from, British territory, *ib.*

—— FARMING:
Arrangements for disposal of opium farms, iv. 457.

—— IMPORT:
Rules for import of opium, iv. 460–62, 464–66.
Import pass, iv. 470, 476.

—— LICENSING:
Old system of license fees retained in certain districts, 26,230–33.

—— MANUFACTURE:
Rules for manufacture of opium, chandu, &c., iv. 459.

—— MINIMUM VEND GUARANTEE:
Abolition was a mistake, 26,151.
Scale based on statistics for 10 or 12 years, 26,163–65, 26,189.
Up to 1889 farm sold by auction, 26,166, 26,188.

BOMBAY, MINIMUM VEND GUARANTEE—*continued.*
System of selection preferable to auction, 26,167, 26,185–88.
Farmer paid difference if minimum not sold, 26,168, 26,190–92, 26,240.
Withdrawn in all districts, ii. 352.
Description of the system, iv. 457.
Materially checked smuggling in Bombay, iv. 480.

—— POSSESSION:
Reduction of legal quantity was a mistake, 26,151.
Limit should be five tola, 26,175.
Subordinate officials take advantage of different scales for possession to obtain convictions, 26,196–204.
Difficulty of procuring evidence, 26,971, 27,089.
Rules for possession of opium, poppy heads, &c., iv. 459.
Special license to medical practitioners, iv. 469, 470.

—— PREVALENCE OF HABIT:
Generally used by the lower classes, 1024, 1025, 1032.
Wealthier citizens prefer champagne, 1026.
Less than one in ten use opium, 1035.
Smoking prohibited, and dying out, in Surat, 22,658–64.
Opium appears to be but little used, 24,670.
One or two per 1,000 consume opium habitually, 24,771.
Eighty per cent. of the children get opium, 24,852, 24,883–85.
Five per cent. of adult population take opium, 24,867.
Four per 1,000 use opium, 25,654.
Twenty per 1,000 of the population use opium, 25,901.
Opium not very extensively used, 26,333.
Always in what medical men call moderation, 26,366.
Consumption in Belgaum is increasing, 26,531–37.
Not more than two or three per 1,000 use opium, 26,673.
One hundred and sixty-six per mille of adult males in Sholapur use opium, 26,710.
Four or five per cent of the population use opium, 26,800.
Ninety per cent. of smokers are Mahomedans, 27,004.
Greatest diversity between districts and provinces, iv. 495.

—— REVENUE:
Average annual revenue from opium, 26,155, 26,242.
Source from which opium revenue derived, iv. 457.

—— SALE:
Opium pills for children sold by Government, 1922–46.
Rules for sale of opium and its preparations, iv. 463, 464.
Licenses for retail sale, iv. 471–76.

—— SHOPS:
Closing a few chandu shops has led to establishment of about 100 private clubs, 1166.
Suppression of licensed smoking houses led to establishment of large number of dens, 24,813–18, 24,827–41, 26,946–51.
Chandu and madak not openly sold, 24,820.
Number of shops licensed for sale of opium, &c., 1883–84 to 1892–93, 26,144, ii. 352.
Abolition of licensed houses for consumption of opium preparations was a mistake, 26,151, 26,946–60, 26,988–91.
Bad characters were under supervision; not so in private clubs, 26,151, 26,172, 26,250.
Smoking shops closed 1st August 1893, 26,205.
Allegations that they remained open with connivance of Government absolutely false, 26,207.
If re-opened consumers would be drawn away from the clubs and dens, 26,209.
Illicit smoking-dens open with knowledge of the Opium Department, 26,436, 26,460–78, 26,498, 26,543, 26,572–77, 27,004, 27,011.
Refutation of statements in 26,436, 27,090.
Opium Department police kept ordinary police from interfering with smoking shops at Muhim fair, 26,460–69.

BOMBAY, SHOPS—*continued.*

Opium Department police usually attend the fair, but not for the purpose of protecting illicit clubs, 27,091.
Ordinary police empowered to act under the Opium Act, 27,092*a*, 27,124.
Police watch opium-smoking shops as part of their duty, 27,110–17.
Habitués now withdrawn from police supervision, 26,919–60.
Action of the Opium Department with respect to unlicensed smoking shops, 26,971–86, 27,089, 27,280.
Suppression of doubtful utility, 27,004.
Closing of licensed opium shops produced no beneficial results, 27,282.

—— SMUGGLING:

Difficulties of preventing smuggling if opium prohibited, 24,813.
Suppression of licensed smoking houses has led to increase in illicit opium, 24,821–25.
Increase ascribed to the ten-tola rule, 26,154.
Farmers of doubtful utility in checking practice, 26,176–80.
Farmers not paying sufficient attention to repression, 26,234.
Excessively prevalent before 1878, iv. 479.
Materially checked by introduction of minimum guaranteed vend system, iv. 480.

—— TRANSPORT:

Regulations for transit, iv. 456.
Rules for transport of opium, iv. 460.
Permit for transport of opium, iv. 470.
Permit for conveyance of opium from Government depôt to shop, *ib.*

—— WAREHOUSING:

Warehousing imported opium, iv. 465.
Bombay opium warehouse rules, 1885, *ib.*
Form of export shipping bill, iv. 477.
Scale of warehouse rent and fees, iv. 478.

BOMBAY ANTI-OPIUM ALLIANCE:

Petition to House of Commons—authenticity of signatures, 241, 245, 1922, 25,598–649, 25,670–715, 25,749–68, 25,772–93, 25,841*a*–49, 25,873, 25,876, 25,965–81, 26,071–118, 26,436, 27,092*b*, 27,380 27,711–19, iv. 481–84.

BOMBAY NATIVE STATES:

Growth of poppy prohibited, 959–62.
Arrangements regarding opium, ii. 356.
Quantity imported for home consumption, *ib.*
Text of agreements now in force, ii. 360–70.
*See also* NATIVE STATES.

BRAHMINS:

Formerly did not use opium; nowadays they do, 22,786.
Would not take to alcohol if opium prohibited, 22,818.

BRAHMO SAMAJ:

Evidence given on behalf of the Association, 5922.

BRITISH INDIAN ASSOCIATION:

Nomination of witnesses, 8793–800.
Dissent from President's view, ii. 259.
Memorial of the Committee, ii. 313.

BRITISH MEDICAL ASSOCIATION, BURMA BRANCH:

Memorandum on draft rules, ii. 499.
Memorial setting forth value of opium as medicine, v. 137.

BUNDI:

Prohibition would be submitted to under protest, 20,921.
Cost of additional preventive establishment, *ib.*
Details of poppy cultivation, 20,922, 20,951.
Higher rates charged for opium lands, 20,923–26.
Loss to cultivators through prohibition, 20,927–33.
Loss to traders, 20,945.
Opium goes through Indore scale to Bombay, 20,949.
Statistics of poppy cultivation, iv. 395.
Estimated loss to the State, &c., if prohibited, *ib.*
*See also* NATIVE STATES.

BURMA:

Statistics of population, 6979–82.
History of opium consumption, 7991–8013.
New system of opium administration, 6455–568 6711.

—— ADMINISTRATION:

Special restrictions to check excess of consumption, 2077.
Arrangements for supply and sale of opium, ii. 353.
System of opium administration, ii. 463.
Papers regarding the use of opium by Burmans, ii. 481–83.
Letter submitting draft of rules under Opium Act, ii. 489–91.
Draft rules, ii. 491–98.
Correspondence respecting draft rules, ii. 499, 500.
Note, with extracts from excise reports, 1867–68 to 1888–89, ii. 514–22.
Further papers regarding opium, ii. 537, *et seq.*
Note on the opium question, ii. 624–28.
Instructions issued pending promulgation of new rules, ii. 632.
Notification of change of policy, ii. 633.
Government order, *ib.*
Remarks on the draft revised rules, ii. 634–36.
Rules framed under the Opium Act, 1878, and draft revised rules (in parallel columns), ii. 636–48.
Forms, ii. 649.
Despatch from Government of India to Chief Commissioner, ii. 650–52.
Draft rules as received from Burma, and as revised by the Government of India (in parallel columns), ii. 652–64.
Forms, ii. 665, 666.

—— CONFISCATION:

Disposal of things confiscated, ii. 471.

—— CONSUMPTION:

"Consumption of opium in British Burma," extract from, 77.
Among races in Lower Burma, 6584, 6585, 6608–33.
Facilities for, by non-Burmans, 6771–74.
Among the Burma Military Police, 6332.
Among Chinese in Burma, 7001, 7062, 7070–72, 7093–97, 7108–20, 7155–74.
Among the Coringhis, 7190–93, 7203–10, 7241.
Among Burmese coolies, 7278–88.
Consumption of opium, 1878–79 to 1887–88, ii. 447.

—— CRIMINALS:

Per-centage of opium consumers, ii. 547–49, 551, 606.

—— CULTIVATION:

Prohibited except in Katha, Bhamo, and Upper Chindwin, ii. 463, 466, 471.

—— DENS:

Disturbance generally created by shumshoo drinkers, 7355.
Licensed opium farms in Toungoo, 7743–55.
Notoriously used for disposal of stolen property, ii. 578.
Should be closed to Burmans, ii. 590.
Note on opium dens, ii. 608–24.
Should be suppressed by law, ii. 611, 615.

—— DUTY:

Imported opium, 6522, 6524, 6528, 6539–43, 6547, 6548.
Import duty very heavy, 6868.

—— EXCISE DEPARTMENT:

Proposed increase of excise establishments, 8367, 8368.
Excise establishments in Burma, ii. 484–87.
Extracts from excise reports, 1867–68 to 1888–89, ii 514–22.

—— EXPORT:

Opium exported by Government only, ii. 464, 469.

—— FARMING SYSTEM:

Sale at opium farms in Lower Burma, 7743–55.

BURMA—*continued.*

—— IMPORTS:

Importation from the Shan States, 6520–23, 6547.
Regulations for the import of opium, ii. 464, 468.

—— INQUISITORIAL MEASURES:

Detection of offences against opium law in Burma, 7553–66.
Police espionage for detection of illicit use and possession of opium, 8079.
Special preventive officers liable to degenerate into tyrants, 8248–56.

—— LICENSING:

High fees encourage smuggling, 6636–50.
Possession without license should be forbidden, 6639–43, 6658–67.
Difficult to fix the license fee at proper figure, 6644.
System of auctioning licenses radically wrong, 6760, 6785–88.
Effect of the system on smuggling, 6779–84.
Ring among bidders in Mandalay, 8270, 8291.
Experimental restriction of number of licensed shops not successful, 14,866.
System of licensing, ii. 464, 465, 469–72.
Forms of licenses, passes, permits, &c., ii. 471, 472–79.
Existence of shops has stimulated, if not created, taste for opium, ii. 543.

—— MANUFACTURE:

Regulations for the manufacture of opium, ii. 463, 466.

—— NATIVE CHURCHES:

Serious injury inflicted through opium habit, 335.
Opium consumers not retained as members, 6976–78.
Drunkards and opium-smokers excluded, 7760, 7856, 8012.

—— OPIUM:

Kinds of opium and preparations permitted, ii. 463.

—— POLICE OPPRESSION:

Prohibition will doubtless tend to increase in blackmailing, ii. 565, 575, 579, 581, 584, 589, 591, 601, 602, 607.
Search for illicit opium a fertile source of oppression and blackmailing, ii. 612, 627, 630.

—— POLICY:

Government policy of prohibition supported by general opinion, 309–11.
Policy of the Government, 6746–52, 8201–26.
Officials disposed to advocate prohibition, 16,937.
Policy of former Administrations, ii. 514.
Despatch assigning reasons for change of policy, ii. 627–31.

—— POSSESSION:

Unlicensed possession should be forbidden, 6639–43, 6658–67.
Regulations respecting possession of opium, &c., ii. 463, 467.

—— PREVALENCE OF HABIT:

Opium-smoking prevalent in Burma, 373, 7232.
One in 5,000 uses opium in Upper Burma; number much larger in Lower Burma, 7525, 7526, 7573, 7574.
Opium used, where there were Chinamen, before the annexation, 7527, 7536, 7540; prohibition was ineffectual, 7529–31; except in Upper Burma, 7589.
Liquor was not prohibited and freely used, 7532–35.
Habit as common in interior as in towns, ii. 543.
Much more widespread than in India, ii. 544.
Eating common in country districts; smoking in towns, ii. 564, 565, 569.
Smoking more prevalent in Upper Burma than eating opium, ii. 588, 589.
Number of smokers in Lower Burma, ii. 608.
Not common amongst agriculturists in the plains, ii. 610.

—— PRICE:

Government and Native opium in Burma, 8289–95.

BURMA—*continued.*

—— PRISONERS:

Statistics of opium consumers, 6673–77, 6685–88, 6700–4, 6822–27.
Opium cut off except in hospital, 6799–801.
Invariably go sick when opium stopped, 7634–36, 7672–74; fatal cases have occurred, 7634, 7672–74.
Eighty per cent. of habitual criminals in Burmese jails are addicted to opium, 8117.
Statistics of opium consumers: in Arakan, ii. 539, 552; in Pegu, ii. 540; in Irrawaddy, ii. 541; in Tenasserim, ii. 542; in Burma generally, ii. 605; in Henzada district, ii. 606.
Number of opium-smokers in jail in Lower Burma, 1883–91, ii. 630.

—— PROHIBITION:

Undoubtedly difficult to prohibit opium to Burmese and allow it to other races, 320, 375–79.
Prohibition is the only remedy at disposal of Government, 322–30, 336, 337, 378.
Under Burman rule, 6966–68.
Worth trying, although will increase smuggling, 6993, 6994.
Mistaken policy in not extending prohibition to Chinese, 7401.
Was ineffectual before annexation, 7529–31; except in Upper Burma, 7589.
Effectual in Upper Burma since possession as well a sale made punishable, 7589–91.
Should be extended to non-Burmans, ii. 537.
All shops should be closed, *ib*
Additional preventive measures required, ii. 538, 546.
Opinions as to best means of enforcement, ii., 544, 545.
Mistake to prohibit opium to Burmans and not to non-Burmans, ii. 547.
Would be practically impossible, ii. 549.
Sale to non-Burmans only will pave the way to total prohibition, ii. 550.
Danger of making country a nest of smugglers, ii. 562, 565.
Legislative interference useless without aid of respectable Burman society, ii. 582.
Practical difficulties in way of prohibition, ii. 588, 591.
Not successful in Upper Burma, ii. 595.
Restrictions effectual in Burma, ii. 601.
Would be rendered ineffectual by smuggling, ii. 627.
Experience of practical prohibition since 1885–86. ii. 630.

—— PROSECUTIONS:

Frequent prosecutions for illicit sale, 6627–29, 7263–72.
Number likely to be reduced by bribery, 8060–63.
Very few convictions under the Opium Act and Rules in Henzada, 8181.
Offences against the Opium Act in Lower Burma, 8401.
Charges of opium smuggling, 1890–93, ii. 503–5.
Statement showing number of persons arrested, convicted, and imprisoned under the Opium Act, in Upper Burma, 1889–90 to 1892–93, ii. 506, 507.
Statement showing number of persons arrested, convicted, and imprisoned under the Excise Laws (both opium and liquor), in Lower Burma, 1883–84 to 1892–93, ii. 508–13.
Offences against the Opium Act in Lower Burma, 1884–92, ii. 508.
Hundreds of Arakanese imprisoned or fined for purchasing opium from unlicensed vendors, ii. 548.
Burmans convicted under Opium Act, in Mandalay, 1888–91, ii. 583.
Offences against Opium Act, 1891–92, ii. 630.
Difficult to obtain evidence, ii. 620, 621.
Convictions under the Opium Act, in Shwegyin, 1888–91, ii. 621.

—— REGISTRATION:

Registration system, 2528, 2558, 2559.
Non-Burmans should be registered, 6659.
Voluntary registration of Native consumers, 6988, 6989.
Popular objection to the restriction in Burma, 7475.
Inadvisable in case of temporary visitors, 7618.
Confirmed smokers will not like it, 7619.
Smokers could go back to China if they object to the order, 7724, 7725.

BURMA, REGISTRATION—*continued.*

Licenses to consumers in Burma, 8067.
Number of Burmans registered, April to July 1893, 8366, 8393, 8394, 8398–400.
System of registering Burmans, ii. 464, 467.
Number of registered consumers, ii. 465, 479, 480.
Number of persons registered as opium consumers in Lower Burma, ii. 487.
Memorial praying that system be extended to non-Burmans, ii. 488.
Reasons assigned for omission of draft rule extending registration to non-Burmans, ii. 489.
Suggested licenses for consumers, ii. 538.
Policy of registering consumers, ii. 545.
Non-Burmans should be registered, ii. 627.
Form of register of habitual opium consumers, ii. 634.

—— REVENUE:

Suggested means of meeting loss from prohibition, 7290–92.
Estimated loss through introduction of new rules, ii. 631.

—— SALE:

Restrictions on sale of opium, 2106.
Number of licensed shops, 6582, 6606, 6607, 6619–25.
Should be restricted as much as possible, 6684, 6691.
Effect of direct sale by the Government, 6765–70.
Restrictions should be extended to the Shan States, 7344, 7345.
Number of shops, issues, and receipts, 1883–84 to 1892–93, ii. 354.
Regulations for wholesale and retail sale, ii. 464, 465, 469, 479, 480.
Direct sale by Government agency, ii. 465.
Statement of sales of opium, 1882, 1890, ii. 607.
Draft rules for supervision of licensed shops, ii. 620, 622.

—— SALE, ILLICIT:

Indians or Chinese buy full quantity allowed, and sell it to Burmans, 319, ii. 607, 617.
One man in a thousand purchases at the licensed shop, 6626–50.
Chinese vendors endeavouring to spread taste for the drug, 8033, 8213.
Licensed vendors get, and sell, British opium illicitly, 8040–53.
Prohibition likely to lead to greater illicit sales to Burmans, 8063.
Reports on, in opium-smoking dens, ii. 608–24.
Suggested preventive measures, ii. 610, 616, 620–22.

—— SHOPS:

Consumption on premises forbidden except in Shan districts, ii. 538.
Congregation of smokers at the shops aids the police in supervision, ii. 607, 608.

—— STATISTICS:

Exaggerated and sensational tone of official statistics, 8080–340, 8366.
Carelessly collected and unreliable, 14,872–74.
Opium consumption in Arakan, ii. 539, 547–55; in Pegu, ii. 540, 555–63; in Irrawaddy, ii. 541, 563–70; in Tenasserim, ii. 542, 570–80; in Upper Burma, ii. 546, 547, 580–604.
Consumers in Lower Burma, ii. 543.
Review of the official statistics, ii. 625–27, 629, 630.

—— SMUGGLING:

Smuggling from Chittagong, 3237.
Preventive measures, 6525, 6526, 6549–55, 6575, 6576, 6586–95, 6630–36.
High prices encourage smuggling, 6636–50.
Smuggling from Shan States cannot be prevented, 6877–83.
Contraband opium from Yunnan, 6748–50, 6762, 6779–84.
Chinese frontier smuggling could be prevented in Upper Burma, 7257–62.
Opium brought secretly from India by Assam, 7592.
From the southern Shan States into Burma, 7567–72.
Preventive measures on the Shan frontier, 7595, 7596.

BURMA, SMUGGLING—*continued.*

From China into Kamaing, 7640–47.
Licensed vendors are the greatest smugglers in Burma, 8039–58.
Licensed vendors co-operate with the preventive officers in detection of illicit sales, 8055–57, 8299; but are very ready to smuggle themselves, 8300.
Difficult to check in Burma; temptation will be increased under the new rules, 8367.
Smuggling by sea, 8375–84.
Smuggling from Shan States, 14,878.
Importation of Chinese opium prohibited, 14,879, 14,880.
Opium smuggling into Burma, ii. 500–2.
Statement of smuggling across the east frontier, 1890–93, ii. 503–5.
Prevalence of smuggling in former years, ii. 514, 515.
Suggested preventive measures, ii. 544, 553, 556, 557, 562, 563, 565, 579, 581, 584, 586, 588, 589, 591, 596, 601–4, 606, 607.
Carried on to a considerable extent, ii. 562, 568, 591.
Report on illicit traffic in opium in Shwegyin, ii. 620.
Difficulty of preventing almost insuperable, ii. 630.

—— TRANSPORT:

Regulations for the transport of opium, ii, 464, 468, 469.

—— VENDORS, LICENSED:

High fee for license induces vendors to smuggle, 6636–50.
Licensed vendors have helped to drive out Yunnan opium, 6779–84.
No restrictions on sales, if duty paid, 7594.
Licensed opium farms in Toungoo, 7743–55.
Vendors use their licenses as means for sale of smuggled drugs, 8021.
Number of shops in Burma compared with India, 8215, 8216, 8224.
Existence of licensed shops denotes Government approval of the habit, 8235–44.
Have agents hawking opium in the villages, 8301–10.
Local public opinion consulted before new shop licensed, 8314–17.
Dispensaries more numerous than opium shops, 8336.

—— VENDORS, OFFICIAL:

Under proper safeguards, Native practitioners could be entrusted with sale for medical purposes only, 6713.
Establishment of special Government agency suggested, 6755–61.
Would have to sell at high price, 6765–70.
Would entail loss of licensed vendors' assistance in preventing smuggling, 6779–84.
Three shops in eastern division of Upper Burma, 7592, 7593.
Dispensing would be difficult in country districts, 7815.
Sanction of Local Government necessary to get supplies for sale to workmen from the Government shop, 7933–36, 7961.
Sales to registered consumers should be by Government officers, in dispensaries, 8021–39, 8077, 8078.
Would put an end to illicit sale by agencies, 8305; and convince better class Burmans of our *bonâ fides*, 8312.
Advantages of present system would be more than counterbalanced by closing the shops and supplying opium through dispensaries, 8336–39.
Opium should be distributed by hospitals and dispensaries, ii. 537.
Only way to put down smuggling, ii. 620.

—— ARAKAN:

Consumption of opium, 7354, iv. 454.
Statistics of opium consumption, ii. 539, 547–55.
Effects on Arakanese, ii. 539, 548, 551, 554, 555.
Cases of young consumers, ii. 540.
Inferences from statistics, *ib.*
Statement showing number of smokers and quantity required per month, ii. 550.
Statement showing sales of opium, persons arrested, &c., 1872–73 to 1891–92, ii. 551.
Report regarding opium consumers, ii. 552.
Cases of opium-smokers, ii. 554, 555.
Number of opium dens in Prome, ii. 612.

BURMA, ARAKAN—*continued.*
Number of houses resorted to by opium-smokers in Paungdè, ii. 613; in Shwedaung, ii. 614.
Note on the official statistics, ii. 625–27.
Experience of prohibition in Arakan since 1885–86, ii. 630.

—— IRRAWADDY:
Statistics of opium consumption ii. 541, 563–70.
Effects on Burmans in the division, ii. 542.
Inferences from statistics, *ib.*
Note on the official statistics, ii. 625, 626.

—— LOWER:
Summary of results of inquiries, ii. 543.
Note on opium dens, ii. 608.
Number of opium-smokers, *ib.*

—— PEGU:
Petition from Chinese in Rangoon in favour of suppression of opium, ii. 525.
Statistics of opium consumption, ii. 540, 555–63.
Inferences from statistics, ii. 541.
Rangoon. Return of consumers of opium, ii. 558; statistics of opium consumption, *ib.*
Report on opium dens, ii. 614–17.
Note on the official statistics, ii. 625, 626.

—— SHAN STATES:
Arrangements regarding opium before annexation, 313, 376.
Consumption of opium, 6858–65, 6923–39.
Cultivation and smuggling cannot be prevented, 6877–83.
Thirty per cent. addicted to opium, 6952.
Cultivation and export of opium, 7304–11.
Five per cent. of population of Thibaw smoke opium, 7341.
Smuggling from the southern Shan States, 7567–72.
Preventive measures on the frontier, 7595, 7596.
Few opium consumers except on the caravan routes, 7764, 7769.
Poppy not much cultivated for commercial purposes, 7765–68, 7820–23.
Consumption increasing among the coolies, 7770–76.
Habit is learned from Chinamen, 7777, 7778.
Prepared smoking opium brought up from Mandalay, 7778–86, 7829–39.
Custom introduced from Yunnan, 7861, 7877, 7878.
About half the people smoke opium, 7861; smoked for pleasure and to keep off fever, 7862.
Poppy cultivated in the hills at Theinni, 7890–95.
Price of Indian and Chinese imported opium in Shan States, 7925.
Smuggling would be uncontrollable if further restrictions imposed on Indian-grown opium, 7927–29.
Consumption of opium by coolies on the Mu Valley Railway, 7951–66.
Smuggling into Burma, 8367, 8374, 14,878, ii. 501.
Sawbwas have no power to prevent growth of opium, 8388–92.
Opium in the Shan States, ii. 500.
Consumption of opium by the Shans, ii. 523.
Opium nearly as deleterious as to Burmese, ii. 537.
Suffer from opium as well as Burmans, ii. 580.

—— TENASSERIM:
Statistics of opium consumption, ii. 542, 570–80.
Effects on Burmans in the division, ii. 542, 579.
Inferences from statistics, ii. 543.
Report on opium dens, ii. 618–24.
Steps taken to suppress dens, ii. 619.
Illicit traffic in Shwegyin, ii. 620.
Importers and vendors and number of opium-smokers in Shwegyin, ii. 621, 622.
List of persons who keep opium dens, ii. 623.
Note on the official statistics, ii. 625, 626.

—— UPPER:
Opium and alcohol rigidly prohibited before annexation, 293, 368–70.
Principal reason people too weak to withstand temptation, 294.
Burmese edicts of prohibition were effectual, 306, 307, 356–58.
Regulations regarding opium before annexation, 308–16.

BURMA, UPPER—*continued.*
Regulations introduced by Government of India, 317, 368.
Policy unsuccessful, 318, 336.
Kumaing. Smuggling from China, 7640–47.
Consumption at the jade mines, 7668, 7669, 7680, 7681, 7684.
Difference in the law regarding possession in Upper and Lower Burma, 8257–69, 8287.
Effect of the new rules in Upper Burma, 8270–86.
Rules not altogether operative, 8386.
Statistics of opium consumption, ii. 546, 547, 580–604.
Note on opium dens, ii. 609, 615–17.
Yunnanese leaving Mandalay in consequence of opium rules, ii. 615.

BURMANS:
Burmans bear opium much worse than Chinamen, 263, 295, 6796, ii. 605.
Tendency to abuse of alcohol a prevalent vice among the Burmese, 333.
Injurious effect of opium indisputable, 897.
Burman who takes opium more prone to excess than other races, 6697.
Opium has a very bad effect on Burmans, morally rather than physically, 6777.
Tendency to excess in opium, as in everything they do, 7442, 7443.
Ten per cent. of the adults consume opium, 7456–59, 7521, 7522.
Strongly affected morally by opium, 7542, 7580.
Burmans come under its influence in an extraordinary degree, 8015–17.
Used without apparent bad effect among fishermen and foresters in Burma, 8184.
Much given to excess, 14,830, 14,832.
No definite evidence of evil effects of opium, i. 141.
Opium specially deleterious to Burmese, ii. 537, 561.
Report on evils of opium, ii. 561.
Policy of British Government ruining the race, ii. 544, 589.
Cases of opium-smokers, ii, 544, 555, 592.
Cannot take opium or liquor in moderation, ii. 560, 563, 568, 578.
Cases of death through stoppage of opium, ii. 561.
No constitutional reason why opium should be specially deleterious to Burmese, ii. 563.
Effects of opium, ii. 579, 591.
Instances of deterioration, ii. 598–600.
Smallest quantity of opium produces injury, ii. 609.
Leading article in "Mandalay Times" on evils of opium, ii. 624.

BUSHAHR:
A good deal of poppy cultivated, 16,389–93.
Against prohibition of cultivation, 16,394.
Consumption of opium, 16,395–98.
Compensation would be due to cultivators if opium prohibited, 16,399.

*See also* NATIVE STATES.

CAWNPORE:
Consumption of opium, 15,139–43.

CENTRAL INDIAN AGENCY:

Arrangements for levying transmit duty, 963–69, 977.
States responsible for enforcement, 990, 991.
Consumption of opium, 21,812, 21,870.
All castes in Central India, except Bohras, eat opium, 21,870.
Excessive consumption exceptional, *ib.*
Poppy cultivated by most prosperous class of peasantry, 21,811, 21,826, 21,862.
Profitable and popular in Central India, 21,840–43.
Smoking discouraged by some States, 21,870.
Practice not general in Central India, *ib.*
Cultivation and use absolutely free, 23,206.
Opium more profitable than other crops, 23,294.
Area under poppy steadily increasing, *ib.*
Perceptible decrease in number of madak shops, 27,576, 27,588–91.
States producing Malwa opium, ii. 346.
Arrangements with Native States regarding opium, ii. 355.
Clauses relating to opium in Salt Agreements, 1879, *ib.* 359.
Right to levy transit duties, ii. 355.
Questions regarding opium issued to the durbars of the Native States, iv. 405, 406.
Statistics regarding opium in the Native States, iv. 406–17.
Retail price of opium, iv. 417.
Abstracts of evidence of witnesses not examined, iv. 417–24.

*See also* NATIVE STATES.

CENTRAL PROVINCES:

Madak smoking carried on although prohibited by law, 27,620–40.
Smoking shops still in existence, with cognizance of the authorities, 27,840.
Policy of closing shops of doubtful advantage, 27,842.
Cultivation free up to 1873–74, except in Sambalpore, 28,235.
Import allowed from Native States on payment of small duty, 28,236–39.
Bengal system introduced in 1873–74, 28,240.
Consequent great rise in revenue and price, 28,241–47.
New system completely introduced, 1879–80, 28,249.
Consumption slightly increased, 28,251.
Number of madak shops reduced; preparation considered harmful, 28,252, 28,253.
Cultivation closed in all districts in 1878, 28,254.
Smuggling still going on in spite of preventive measures, 28,256, iv. 513.
Temporary shops licensed for bazaar day, 28,260–65.
Smoking on licensed premises forbidden; still practised in secret, 28,266.
Prohibition probably lessens consumption, 28,268–70.
Arrangements for supply and sale of opium, ii. 349.
Number of shops, issues, and receipts, 1883–84 to 1892–93, *ib.*
Administration of the excise revenue from opium, iv. 511–22.
Revenue and system of control in the Khalsa, iv. 511.
Smuggling of opium, iv. 513.
Opium arrangements in feudatories and zamindaris, iv. 513.
Yearly issues under these arrangements, 1881–82 to 1892–93, *ib.*
Statement showing number of licenses for cultivation of opium, area cultivated, and annual outturn, 1866–67 to 1877–78, iv. 514.
Opium rules in force, iv. 515–20.
Manufacture permitted under license, iv. 515.
Possession. Amount permitted without license, *ib.*
Rules for transport of opium, *ib.*
Import, and export, on account of Government permitted, *ib.*
Rules for transit of opium, *ib.*
Rules for wholesale and retail sale, *ib.*
Farm of duties leviable on retail vend, iv. 516.
Disposal of things confiscated, and rewards, *ib.*
Special license to medical practitioners, iv. 517.
License for retail sale of opium, *ib.*
License for the manufacture and retail sale of madak or of chandu, iv. 518.
License for the manufacture and retail sale of madak or of chandu (granted by farmer), iv. 520.
Number of shops, issues, and receipts, 1870–71 to 1892–93, iv. 521.
Details of opium issued, 1871–72 to 1892–93, *ib.*

CENTRAL PROVINCES—*continued.*

Receipts from duty and license fees, 1870–71 to 1892–93, *ib.*
Correspondence respecting closing madak shops, iv. 522.
Statement showing consumption per head, 1892–93, *ib.*
Abstracts of evidence of witnesses not examined, iv. 523, 524.

CEREMONIAL USE:

Opium drinking at betrothals in Rajputana, 13,843.
Opium forms part of no religious rite, 16,902.
Opium presented to friends and others in Malwa, &c., 18,789.
Commonly used at marriages and other ceremonies, 19,777.
Opium used at Rajput ceremonies, 19,902.
Opium used at Rajput religious festivals, 20,175, 20,220, 20,323, 20,330, 20,334, 20,604, 20,698, 20,889–95, 20,982, 20,990.
Used by Bheels to celebrate peace after a feud, 20,262.
Opium taken by the Kachwahas at feasts of betrothal, 20,268.
Opium absolutely indispensable at festivals, &c., in Rajputana, 20,422, 20,423, 20,428–31, 20,771, 21,577, 21,590, 21,655.
Use of amal pani considered sacred by Marwaris, 21,073, 21,082, 21,117.
Ceremonies at which opium is obligatory, 21,128, 21,156.
Special occasions on which opium considered absolutely necessary, 21,764, 21,779.
Used on important occasions by all warlike classes, 22,385, 22,496.
Use by the Kathis, 22,578.
Some people only take opium at ceremonies, 22,847, 22,869.
Kasumbha given in darbars, &c., 23,232.
Use of kasumbha at ceremonies, 23,656, 23,750, 23,985, 24,012, 24,037–43, 24,390, 24,407, 24,427, 24,453, 24,647, 24,659, 24,904.
Old custom of giving opium now dying out, 23,864, 24,567–73.
Necessary to continue the long standing practice of using opium, 24,498.
Kunbis use opium at caste feasts, but consumption on such occasions is largely diminishing, 24,566.
Opium indispensable at Rajput ceremonies, 26,408, 26,421.
Practice falling off on account of expense, 26,429.

*See also* SOCIAL USE.

CEYLON:

Indian opium imported, 1855–56 to 1893–94, ii. 335, 391.

CHANDU:

Preparation, method of smoking, and effects, 1058, 27,789.
Debts for chandu not recoverable in Perak courts, 1637.
Pure liquefied opium; not so largely smoked as gooli, 2593.
Preparation of opium for smoking, 2707, 11,896, 11,897, 11,921, 11,929, 12,851, 13,689, 15,139–46.
Simply boiled opium, 2892–95.
Manufacture should be prohibited, 3529, 3538–44, 3579–84, 4676, 4677, 16,009.
Stopping of manufacture not advisable, if result would be to drive consumers to alcohol, 3768.
Manufacture and use should be discouraged, 4448–55.
Public sale should be stopped, 4607.
Number of licenses in Lower Bengal, 4800, 4816–55, 5041–45, 5051–54.
Unlicensed manufacture should be prohibited, 4922, 4923.
Number of shops in Lower Bengal has been reduced, 4925.
Chinese method of manufacture, 7836, 7837.
Shops should be closed except where there is a Chinese population, 10,790.
Analysis, 13,479–82.
Can only be sold in Lucknow by licensed vendors, 13,737–48, 13,767–77.
Manufacture for domestic use permitted in Lucknow, 13,778–82; requires special license in Bengal, 13,779, 13,822.

CHANDU—*continued.*

Preparation is rather difficult, 13,788, 13,789.
Smoking is not displacing eating, 13,835.
Sale should be prohibited, 14,522, 14,604–16.
Sale by license discontinued in the Punjab, 15,713.
Chandu shops were very disreputable places, 16,015–17.
Consumption decreased in Punjab since shops closed, 16,053.
Colourable sale in opium dens, 16,702, 16,777–80, 16,788–97.
Extremely difficult to get a conviction, 16,793–98.
Made privately since closing smoking shops in Lahore, 18,226–31.
Not allowed to be sold in Jeypore, 20,248–52.
Sale prohibited in Dholpur State, 21,655, 21,664, 21,688–97.
Method of smoking, 26,040.
Number of licensed shops in Bombay, 1883–84 to 1892–93, 26,144.
Usual for smokers to sleep, presumably intoxicated, before leaving premises, i. 141.
Number of licensed shops in Bengal, Assam, and N.-W. Provinces, 1883–84 to 1892–93, ii. 348, 349.
Correspondence respecting smoking in unlicensed places, ii. 392–97.
Method of manufacture, ii. 393.
Evil effects much overrated, ii. 412.
Chinese do not appear to suffer from chandu smoking, ii. 413.
System of licensing and sale in Bengal, ii. 427.
Number of licenses in force in Bengal, 1873–74 to 1892–93, ii. 428.
Revenue from license fees, ii. 429.
Licenses, and fees in Assam, 1873–74 to 1892–93, ii. 455.
Manufacture and use, v. 87.

*See also* MADAK, SMOKING.

CHANDUBAZ:

Opium-smoker; a term implying contempt and disgrace, 12,665, 12,671, 18,210.

CHARAS:

Natives of Kumaun prefer charas to opium, 4268.
Consumers considered dissipated, 17,069.
Pathans take charas more commonly than opium, 17,576, 17,580–83.
Prohibited by the Sikh religion, 17,846.

*See also* BHANG.

CHEENA:

Small millet; can be grown with poppy crop, 5515, 5538.

CHIK:

Poppy juice, 20,523.

CHINA:

History of the Chinese opium trade, 20, 21, 1189–279, 1285–374, 2401–24.
Incidents of the opium traffic 797–99.
Opium not introduced by the English, 1285.
System under which China is now supplied with opium, 5164.
Excise arrangements, 5397, 5398, 5402–5.
Opium used long before English introduction, 5401.
Opium exported to China long before establishment of British rule in India, i. 133.
"Historical Note on Opium in China," cited, i. 36; Text reprinted, i. 147–58; Index, i. 158–61.

Malwa opium, used as currency in Hankow, ii. 443.
Chinese currency difficulties, *ib.*
Population rapidly increasing in spite of "destructive effects" of opium, ii. 444.

—— CONSUMPTION:

Proportion of Indian opium consumed, compared with Chinese, is merely fractional, 555, 1285.
Indian opium a luxury, 584–90, 621, 872, 3188, 4214, v. 215–342 (par. 16).
Consumption of opium, 7001, 7062, 7070–72, 7093–97, 7108–20, 7155–74, v. 213–341 (par. 1).
Prohibition in India would have no effect, 24,516, 26,970.
Amount consumed in Szuchuan, ii. 386.
Consumption of Indian and native opium, ii. 441.
Probable effect of prohibition or restriction of Indian exports, v. 215–342 (par. 17).

CHINA, CULTIVATION:

Import of Indian opium gives home cultivation a stimulus, 13, 133.
Cultivation of the poppy, 188–97.
Increase of production, 1863–87, 229–32
Will ultimately supplant Indian opium, 234, 235.
Greatly increased during the past 10 years, 304.
Very profitable in China, 636.
Introduction of Indian opium led to increased growth in China, 636–38.
Greatly increased in recent years, 646.
No poppy grown in Fuh-Kien, 1860–80, 755.
No greater delusion than that China depends on India for opium, 872.
A single province grows more than all India, *ib.*
Whole provinces are covered with poppy, *ib.*
Cultivation widespread in 1830, 1216–20.
Cultivated in 10 provinces as far back as 1847, 1285.
Four times as much opium grown as is exported from India, 1561.
If production increases very largely, Indian exports may fall off, *ib.*
About 200,000 cwt. produced annually, 1654–60.
Enormous increase has reduced Indian imports, 1837.
Can easily replace Indian drug by increasing cultivation, or importing from Persia or Turkey, 25,552.
Cultivation of poppy and production of opium, i. 168.
Poppy growing districts of Szuchuan, ii. 383.
Tenure of poppy lands, *ib.*
Opium *v.* wheat. Comparison of profits, ii. 384.
Method of cultivation, *ib.*
Taxation and Government interference, *ib.*
Probable effect of suppression of Indian trade on cultivation in China, v. 215–342 (pars. 11, 16, and 17).
Estimated area under poppy, and average annual outturn of opium, v. 216–343 (par. 18).

—— IMPORTS:

Imports from India, 1880–91 to 1891–92, 14, 15.
Imports of Persian opium, 134–36.
About 100,000 cwt. of Indian opium imported annually, 1654.
Imports from India fallen off; home-grown drug cheaper, 25,017–20, 25,035.
Malwa opium imported at Shanghai, 1883–84 to 1892–93, 26,139.
Opium entered in tariff as foreign medicine, i. 137.
Average import of opium, *ib.*
Indian opium imported, 1855–56 to 1893–94, ii. 390.
Indian opium imported direct, 1850–92, ii. 441.
Indian opium imported *viâ* Straits Settlements, 1887–92, *ib.*
Imports of Indian and Persian opium, 1888, 1892, ii. 442.
Quantity, and approximate sum paid for opium, 1852–53 to 1861–62, ii. 448.

—— MISSIONS:

Opium traffic tends to hinder missionary work, 238, 239, 342, 434.
Chinese refuse moral teaching from the English who deal in opium, 351, 393–95, 424–26.
Greatest hindrance to work of Christian missionaries, 502, 622, 647, 677.
Opium renders missionary labour more difficult, 859–61.
Compelled in their own personal interest to denounce opium, 1615.
Every disturbance is due, not to opium, but to missionary teaching, *ib.* 1632.
Missionary statement that Chinamen are ashamed of opium-smoking is untrue, 1628.
Missionary views insincere; cry against opium by way of advertisment, 1637.
Missionaries more in contact with Chinese people than officials, 1867.
Terrible hindrance to spread of the Gospel and civilization, 16,936.
Testimony as to demoralisation due to opium greatly exaggerated, 18,519, 18,546–51.
Animosity shown to missionaries not due to opium traffic, ii. 443.

—— NATIVE CHURCHES:

Opium-smokers not admitted to membership, 226, 662–67, 677.

China, Native Churches—*continued.*
Native Christians taken under protection of European Government to which missionary belongs, 686-90.
Number of Chinese converts, 775–78.
Classes from which converts are drawn, 779–89.
Opium-smokers not permitted to remain in the Church, 1704–7, 1715.

—— Policy:
China perfectly free to deal with opium trade, 23.
Feeling as to attitude of England, 180–84.
Power to exclude Indian opium, 185, 186.
Government not free to prohibit opium, 246–56, 345.
Has no power to increase the duty, 252, 343–45.
Would probably restrict cultivation if Indian importation stopped, 348, 429, 436.
Views of the official class on the opium question, 349.
No hope of effective check while India export trade continued, 438, 442–49, 502, 537.
Chinese still hesitate to prohibit opium for fear of complications with England, 538–40.
Prohibition of Indian trade a matter of moral right, 543–48.
Mandarins would do their utmost to check consumption if Indian trade stopped, 578–81, 659, 660.
Chinese would have put an end to the trade 20 years ago, if Indian trade stopped, 760
Government apparently unaware of right to prohibit opium, 762–64.
Chinese Government free to prohibit or restrict opium if it pleases, 872.
Government has no wish to prohibit importation, 905.
No sign of any desire to diminish consumption, *ib.*
History of the opium question, 1189–279, 1285–374, 2401-21.
Suppression of Indian trade would lead to a revulsion of feeling in favour of England, 1524.
Authorities do not seriously try to prevent consumption, 1637.
Government would give up opium revenue to-morrow if British would do so, 1839.
Mission to India with reference to opium traffic, 5161–67.
No obligation to admit opium, 5412–18.
Indian opium imported will full approval of Chinese Government, i. 137.

—— British Policy:
Immorality of the Indian trade with China, 4–13, 105.
Export trade the most important, 16, 112.
Policy as to compelling Chinese to import opium, 21–23.
Commercially, politically and morally, one of the greatest blunders and crimes committed, 502.
Government connexion with sales a direct encouragement to the trade, 542.
Action should not depend upon anything Chinese Government may do, 547.
Circumstances connected with opium seizure in 1839, 795.
Attitude of the British Government, 1841–58, 802.
No comparison between exports of spirits from England and export of opium from India, 810–23.
Question whether Government should continue to export opium, if demoralising, 949–52.
Survey of our relations with China, 1189–279, 1285–374, 2401–24.
Object not to force opium on Chinese against their will, 1282.
Opium never forced on the Chinese, 1677, 1699–1702.
Policy with regard to Chinese opium trade, 2279–80, i. 134.
Ruin resulting from Indian trade, 2582.
Argument that trade forced on China exploded, 3188, 3195.
No parallel between China and India, 16,902.
Nothing can be done in India to reduce opium-smoking in China, 18,520.
British treatment of China in regard to opium most disgraceful blot in history, 27,753, 27,757–67.
Impossible to approach China, with view of prohibiting opium so long as drink traffic permitted in England, i. 144
Correspondence concerning existing treaties with China, i. 165–67.

China, Prevalence of Habit:
Prevails widely, and has increased greatly, 172, 173.
Not more than 10 to 20 per cent. smoke opium, 210, 211, 212.
Eighty per cent. of Yamen class, 40 per cent. of merchants, and nearly all labouring classes smoke opium, 300, 361–63.
Increasing rapidly; frightfully prevalent now, 390.
Rapid extension during recent years threatens the existence of the empire, 502.
Enormously increased since 1860, 558–60.
Eight to nine tenths adult males smoke opium, 560, 594–605.
Doubtless greatly increasing, 618.
Excessively common in all classes, except perhaps in agricultural districts, 642.
Sixty per cent. of male adults smoke opium, 658.
Prevalent amongst literary classes and mandarins; almost universal among chair coolies, 833, 849–52.
Vast majority consume opium in moderation, 872, 948.
Opium generally used in moderation, 1281.
Smoking general among all classes, 1631.
Largely used in malarial districts of South and Mid China; not used in the hill districts, 1637.
Chinese mostly take opium in small quantities, 1641.
Ten per cent. take opium in moderation, 3 to 5 per cent. in excess, 1643–52, 1708–10.
Smoking by children unknown, 1644.
Women smoke, but not so frequently as men, 1648.
Eating not nearly so prevalent as smoking, 1691–93.
Great many of the best men smoke opium, 1728.
Not so many as 1 in 10, 1729–31, 1745.
Great majority smoke moderately, 1732.
Consumed largely in Kan-suh; one-third of population are smokers, 1969.
Eight out of ten people in the hilly districts smoke, 1977.
Smoking very much increased during last 10 or 20 years, 1978.
Habit universal as regards area, 2022.
Moderate much more common than excessive smoking, 2028, 2040–49.
Habit prevalent among the Chinese, 6728–36.
Very prevalent among the lower classes, 27,788.
Per-centage of consumers—male and female, v. 213–341 (par. 2).
Classes chiefly addicted to opium, and effect on their efficiency in their calling, v. 213–342 (par. 7).
Two-thirds of 1 per cent. of the entire population smoke opium, v. 324 (par. 2).

—— Prohibition:
Treaties prohibiting importation into China, 60–62.
Probability of the Government stopping the growth of opium, 205.
Edicts prohibiting use of opium are posted and proclaimed, but not enforced, 571–74, 619.
Only way out of the difficulty from a missionary point of view, 650–54, 1524.
Entire suppression of the Indian trade advocated, 759, 1802–9, 1819–21.
Chinese officials show great laxity in enforcing prohibitory rules, 761.
Suppression of Indian trade recommended, 800–11.
Cessation of imports from India would be ineffectual, 872, 950.
Prohibition of export from India would be futile, 1313, 1371–73.
Other nations would keep up the supply, 1315, 1316.
Cultivation prohibited because duty on Indian opium keeps the military chest well supplied, 1637.
Probable results of prohibition, 2586.
Prohibition would be regarded as a severe hardship, 5348–62.
Persian opium would replace Indian if Indian trade stopped, 5430.
No object would be gained by prohibition, as China would grow its own opium, 22,202, 22,218.
Prohibition in India would be followed by increased importation from Persia, 26,156; would not decrease consumption, 26,970.
China can and will procure supply elsewhere if opium prohibited in India, ii. 317.
Proposal that Indian Government should supply whole of opium required to Chinese Government direct, ii. 397.
Abolition of Indian opium trade would be followed by largely increased imports from Turkey, Persia, &c., and increased price of native drug, ii. 444.

China, Prohibition—*continued.*
Probable effect of abolition of Indian trade, v. 213–342 (pars. 11 and 17).

—— Public Opinion:
Prejudice against opium trade due to the wars, 264–72, 427.
Prejudice against England seen in the matter of telegraph construction, 350.
Connexion of British Government with opium trade creates serious popular prejudice against everything British, 393–95, 424–26.
Missionary efforts fail to convince people of groundlessness of prejudice, 437.
Hostility against England due to memories of the wars, 648, 655.
Chinese say that opium is "evil, and only evil," 758, 765–67.
Mistaken views of the trade prevalent, 872.
Official opinion divided on opium question, 1305–9.
Hatred of the British not attributed to opium, 1384.
Animosity to Englishmen entirely due to opium traffic, 1514, 1521–23.
No experience of antipathy to missionaries as such, 1515–19.
Chinese never blame England for introducing opium, 1637.
Belief that England forced opium on China does not exist among the Chinese, 1702.
American missionaries only people who hold this view, 1750.
Chinese prejudice is against Englishmen as "foreigners," not as opium introducers, 1989–98.
Chinese prejudice against English as opium introducers non-existent, 2036–38.
Popular belief that England forced opium on China not credited by the Chinese, 5406–11.
No official feeling against the English in connexion with opium, 18,523.
Erroneous popular view that England forced opium on China by war, 23,359, 23,360.
Official view of the moral and material evils of opium-smoking, 28,201–8.
Divided as to advisability of encouraging native-grown opium, ii. 398.
Views as to Chinese hostility to England, v. 213–343, (par. 15).
Memorial by British missionaries in China of over 25 years' standing, v. 353.

—— Revenue:
A good deal of official "squeezing" in collection, 563.
Opium revenue highly prized by the Government; amounts to about 2,000,000*l.* a year, 905.
Opium revenue of greatest service to the Government, 1637.
Revenue from import of opium, 2126, 2127.
Per-centage of opium to general revenue, ii. 449.
Probable effect of prohibition or restriction of Indian exports, v. 215–342 (par. 17).
Revenue from Chinese and Indian opium, v. 247–337 (par. 19).

—— Smuggling:
Contraband opium trade, 790–92, 803.
Causes difficulty in raising the revenue, 1637.
Smuggling out of Szechuan, ii. 384.

—— Trade:
Opium trade has no detrimental influence on British commerce, 1385.
History of British and Indian general trade with China, 1753–58.
Payments for Indian opium prevents China buying English manufactures, 1758–64, 1769, 1790–94, 1849–61.
Deterioration in quality of Chinese teas, and increased popularity of Indian, impairs China's purchasing power, 1761–64, 1862.
Statistics for years 1883–91, 1792.
Small imports not due to any disinclination to purchase English manufactures, 1795–801.
Decrease in British possibly balanced by increase in Indian trade, 1822–35.
Decrease in opium imports has not led to corresponding increase in British trade, 1837, 1838.
Decrease caused by enormous increase of poppy growth in China, *ib.*

China, Trade—*continued.*
Statistics of trade between India, China, Japan, and the United Kingdom, 1821–91, 1862.
Statistics of Indian exports to Japan and of British exports to Japan, China, and India, 1860–91, *ib.*
Commercial benefits of prohibition, 2572–81.
Demand for Indian opium in China, 25,213.
Persia and Turkistan would supply China if Indian trade stopped, *ib.*
Stoppage of opium trade would not lead to increased imports of other Indian produce, 26,867–89.
Effect of opium on exchange, currency, and trade, ii. 387.

—— Transit:
Transit from Szuchuan to Eastern markets, ii. 385.

—— Treaties:
Statement by Sir J. Fergusson in relation to Treaty of Tientsin, 21, 397–99, 438, 545, 1302, 1340–43, 2071.
Authoritative statement should be made on behalf of British Government, 398–401.
Correspondence in regard to Sir J. Fergusson's declaration, i. 165–67.
American and Russian Treaties exclude importation of opium, 60–62, 1311.
Opium clauses in the Tientsin Treaty of 1858, 1245–48, 1291–97, 1330; Chefoo Convention of 1876, 1332–47, 1361; Treaties with United States and Russia, 1311.
Treaty rights, 2070.
Chefoo Convention, 1876, additional article on opium import, i. 137.
Arrangement very advantageous to Chinese Government, *ib.*
Treaties in regard to importation of opium, i. 165–67.
*See also* Policy.

—— Wars, 1839–42:
Alleged cause of the war, 205.
Events of 1839–41, 793–96.
Opium not the cause, 1288–99, 1321–23.
Destruction of opium only the crowning of a series of indignities, 18,524.
Real cause of the war, i. 137.

—— South-West:
Production of opium, ii. 386.

—— Szuchuan:
Poppy growing districts, ii. 383.
Tenure of poppy lands, *ib.*
Opium *v.* wheat. Comparison of profits, ii. 384.
Method of cultivation, *ib.*
Taxation and Government interference, *ib.*
Smuggling, *ib.*
Transit to Eastern markets, ii. 385.
Adulteration and price, *ib.*
Yunnan opium, *ib.*
Consumption of opium, ii. 386.
Amount exported, *ib.*
Total production, *ib.*, v. 256.

—— West:
Report on opium in Western China, ii. 383.
Prevalence of opium-smoking, ii. 385.
Effect of habit on the people, ii. 386.

—— Yunnan:
Opium doing people great injury, 2007.
About half the Yunnanese smoke opium, 7692, 7718.
Production and price of opium, ii. 385, 387.
Gradual decline in price, *ib.*
*See* Yunnan Opium.

Chinese:
An industrious and powerful race, 174, 175.
Bear opium better than Burmese, 263, 295.
Effects of opium-smoking, 389, 420–22.
Opium-smokers are noted for laziness as other Chinamen are for industry, 391.
Agricultural and artisan population strong physically in spite of opium, 612–15.
Chinese nearly all smoke tobacco, 771–74.
No finer, more intelligent, or active men than the opium-consuming Chinese, 1114, 1281.
Effects of opium noticed long before British troubles began, 1285.

CHINESE—*continued.*

Chinese do not habitually drink spirits, 1716; consumption would not be increased if opium-smoking prohibited, 1719; spirit drinking prevalent in some localities, 1745.
Men of fine physique; a superior race, 1720.
Better people than the Japanese, 1721.
Northern wheat-eating races stronger than southern, 1982–84.
A wonderful race; of great powers and physical endurance, 2008.
Would be better were it not for opium, *ib.*
Opium habit a very great evil, 2245.
Stimulating effects of opium, 5421–23.
Smoking in moderation not harmful, 5432–37.
Merchants addicted to opium leave the management of their business to subordinates, 7298–301.
Commence to smoke from 15 to 25 years old, 7399.
Not affected physically or morally by opium, 7541.
Many brought to ruin through smoking, 7408–14.
Generally laborious, strong, and hale, 15,277.
Will not give up habit whether Indian trade stopped or not, 27,699, 27,738.
Chandu smoking seems to make them more fit for laborious work, 27,724–28.
Well-to-do merchants and others all smoke, 27,738.
Do not as a rule own to habit, 27,753.
Nation degenerating morally through opium, 27,777–82
Chinese seen in a deplorable state through smoking, 27,788.
Evil effects of opium-smoking exaggerated, i. 139.
Take to opium-smoking as a stimulant, i. 145.
No injurious results visible on the mass of the people, ii. 316.
People generally muscular and capable of great exertion, *ib.*
Do not appear to suffer from alleged evil effects of chandu-smoking, ii. 413.
Smoke perpetually when not working, ii. 524.
Do not cling to opium so fondly as imagined, ii. 537.
Moral, physical, and social effects of opium, v. 148, 154–342 (par. 3).
Almost invariably smoke, *ib.* (par. 4).
Have great faith in medicinal properties of opium, v. 153.
Per-centage of consumers (i.) not injured, (ii.) slightly, or (iii.) greatly injured by opium, v. 213–342 (par. 5).

—— IN BURMA:

Arrangements regarding opium before annexation, 314–16, 375.
Opium-eaters at Mandalay, 7355.
Twenty per cent. of men in Lower Burma smoke, 7399.
Allowed to use opium in the King's time, 7527, 7536, 7540.
Smoking prevails to a great extent, except among better class of merchants, 7601.
Nearly all the Chinese Shans smoke, 7919, 7931; they earn twice as much daily as Burmese or Indian coolies, 7922.
Exceptional treatment of opium consumers, 8067.
Objection to registration, 8361.
Petition in favour of suppression of opium, ii. 525.
Observations as to consumption of opium, ii. 536.

—— IN CALCUTTA.

Chinese none the worse of opium, 1114.
Have four times the wage of Native Bengalis, 8695.

—— IN STRAITS SETTLEMENTS:

Addiction to opium by particular classes, v. 146, 150, 154–82 (par. 7).
Per-centage of male smokers, v. 147.
Opium-smoking not common among women, *ib.*
Smoking the favourite method of consumption, v. 149.
Poorer classes swallow opium dross, *ib.*
Effects of opium-smoking, v. 148–83 (par. 3).

CHINESE OPIUM:

Production rapidly increasing, 187.
Opium grown in Wen-Chow district of superior quality, and sold as Indian, 304.
Largely replacing Indian opium, 388.
Soil of Chinese Turkestan especially favourable to poppy growing, 556.
Advantage of cheapness in favour of native drug, 582, 591.

CHINESE OPIUM—*continued.*

Mixed with Indian opium to make it palatable, 646.
Burns the throat; generally mixed with Malwa or Patna opium, 1637.
Increased cultivation is causing large falling off in Indian imports, *ib.*
About 200,000 cwt. produced annually, 1654–60.
Cheaper, but not so good as Bengal, 1685–87.
Taking place of Malwa opium in China, 2070.
Much larger quantity grown than imported, 2769.
Four times amount shipped from India, 5347.
Cultivation largely increased; replacing Indian opium, 25,011.
Diminution of supply of Indian opium an incentive to cultivation in China, i. 134, v. 215–342 (pars. 16 and 17).
Known and used long before European sale along the coast, i. 137.
Produce from three to ten times amount imported, i. 138.
Grown openly in spite of nominal prohibition, *ib.*
Exposed for sale in every village, *ib.*
Growth would be increased forthwith, if Indian opium prohibited, *ib.*
Production of opium in China, i. 168.
Fostered by restrictions on cultivation in India, ii. 317.
Adulteration and price, ii. 385.
Analysis, ii. 405, 406.
Keen competitor with Indian drug, ii. 442.
Consular reports, 1890–92, ii. 441, 442.
Effects of Chinese and Indian opium compared, v. 215–342 (par. 3).

*See also* CHINA—CULTIVATION, YUNNAN OPIUM.

CHITTORE:

Return of opium passed the scales, 1883–84 to 1892–93, iv. 415–17.

CHOLERA:

Opium considered a good medicine, 12,638, 12,645.
Largely used by non-consumers during cholera epidemic, 24,518.
Popular belief that habitual consumers to some extent protected, 24,566.
Undoubtedly a prophylactic, 25,957.

*See also* MEDICINAL USE.

CHURA:

Consumption of opium by different races, 24,467.
Arrangements regarding opium, 24,471–81.
*See also* NATIVE STATES.

COCHIN CHINA:

Consumption of opium, 5372, 5375, v. 345.
Indian opium imported, 1874–75 to 1893–94, ii. 335, 391.

COMPENSATION:

Amount estimated at over 100,000,000*l.*, 891.
Would probably not adequately meet the loss involved, 900.
Native States should receive compensation for loss of revenue, 2524–26.
British Treasury not disposed to undertake liability, 2562, 2563.
No inducement to Central Indian Chiefs to prohibit opium, 2709.
Ryots, landlords, &c., would require to be indemnified, 2734–39, 2746.
No compensation paid to cultivators struck off the list, 3019, 3020.
Loss of advances alone equal to 50 lakhs per annum, 5254.
Calculated at 200,000,000*l.*, 5767, 5774.
Workers should be compensated if Ghazipur factory closed, 13,513, 13,514.
Impossible to prohibit poppy cultivation without compensating the landlords, 13,694, 13,799–803.
No allowance made if cultivators' licenses withdrawn, 13,753–56.
Prohibition unjust without full compensation to owners and cultivators, 13,957–61.
Should be paid to both tenants and landlords if poppy cultivation prohibited, 14,398, 14,441.
Would have to be paid to Native States as well as cultivators, 16,031.
Native States would have to be compensated, 18,171.

COMPENSATION—*continued.*

Estimated amount claimable by the States for loss of revenue and profits, 20,434.
A matter of so much money, 20,604.
Would not induce Native States to prohibit poppy, 21,620, 21,644, 21,682.
Task of estimation well nigh impossible, 22,385.
Any possible compensation would be inadequate, 23,104.
Other means for recouping revenue should be devised, 24,341.
Native States dissatisfied with compensation for partial prohibition in 1878, 24,413.
Would add seriously to the financial difficulties of India, 24,516.
Further restrictions in Native States would entail ruinous compensation, 24,813
Estimated amount of compensation to Native States, 25,218.
Estimated amount payable to Bengal ryots, 26,832.
To employés in the Behar and Benares establishments, 26,836.
Compensation to traders an extremely formidable question, 26,841–43.
Missionaries opposed to the principle, 27,876.
Not awarded to farmers when production narrowed, *ib.*
Should not be paid to cultivators in Native States, 27,877.
Would not reconcile people of Native States to prohibition, i. 143.
Approximate estimate of amount payable by England, ii. 450.
Estimated amount required by Native States in Rajputana, iv. 388–99; in Central India, iv. 407.

*See also* FINANCE, NATIVE STATES, PROHIBITION.

CONSUMPTION:

Statement that consumption is rapidly increasing absolutely baseless, 872.
Danger of the habit spreading, 2282–84.
Use of opium greatly extending in India, 2534.
Is daily increasing, 3805–8.
Proportion of consumers, 4195, 4199.
Government should endeavour to check consumption, 5014.
Opium-growing districts are the smallest consuming districts, 5017.
Consumption in opium-growing districts very small; natural deduction is that cultivators supply themselves illicitly, 10,822, 10,852, 10,863–65.
Decreasing since advance of price and better prevention of smuggling, 23,663.
Decreasing by reason of poverty of people and heavy tax, 23,796–99, 23,850.
Has increased notwithstanding enhanced price, 24,332.
Decreasing through spread of education, but liquor drinking increasing, 24,595.
Consumption of opium in India, 1883–84 to 1892–93, ii. 347–54
Quantity sold in Bengal, 1873–74 to 1892–93, ii. 428.
Rate per head in Bengal, 1873–74 to 1892–93, *ib.*
Statistics for various provinces, ii. 447.
Appears to be increasing, iv. 378.
Consumption per head in British territories of the Central Provinces, iv. 522.

*See also* PREVALENCE OF HABIT, *and under the different Provinces and Native States.*

COOLIES:

Opium users incapable of continuous work, 410–19.
Smokers cannot be relied on, 611.
Nearly all coolies smoke, 616
Coolies appear to stand the strain of smoking, 625–30.
Habit almost universal among chair coolies, 833.
Mostly contracted as relief from disease, 1457–63, 1476–79, 1489–91.
Non-consumers do more work than smokers, 2008–10.
Many employers will not have smokers, 2009.
Rejected by Colonial Government in consequence of eating opium, 3533–37, 3549–53, 3576, 3577.
Effect of opium consumption on Indian coolies, 6905.
Consumption of opium by Burmese coolies, 7278–88.
Mekir coolies work well though large consumers, 9524, 9525.

COOLIES—*continued.*

25,000 coolies medically examined annually without a case of visible effects of opium, 9764, 9781–84, 9792.
Opium consumers on the Assam and Bengal Railway, 9922–28, 9945–50.
Labourers in the tea gardens and on the railway, 10,079–95.
Preference given to moderate opium-eaters, 10,154–59, 10,186.
Assamese consume less opium than Mikirs and Kacharis, 10,367.
Opium-eaters do most work, 10,369.
Ninety per cent. of men, 75 per cent. of women, 50 per cent. of children, among Assamese tea-garden coolies smoke opium, 18,350.
Coolies generally begin about 12, sometimes earlier, 18,354.
Contract opium habit in Burma, 27,867–70.
Statistics of smoking among 5,632 Chinese coolies, v. 353.

COORG:

Arrangements for supply and sale of opium, ii. 351.

COREA:

Opium, except medicinal, is contraband, v. 318.
Consumption by Coreans, and Chinese in Corea, *ib.* 319.

CORINGHIS:

Consumption of opium, 7190–93, 7203–10, 7241.
Do not use opium to same extent as Mahomedans, 7432.

COTTON:

*See* SUBSTITUTES FOR POPPY.

CRAVING:

*See under* OPIUM SOTS.

CREDIBILITY OF WITNESSES:

Evidence of habitual excessive consumers not allowed in Chinese courts, 1641.
Smokers do not scruple to give false evidence, 5833, 5884.
Witnesses questioned as to opium habit with the view to shaking their evidence, 9851, 9880, 10,409–20.
Kania is invariably considered as unworthy of credit, 9957, 10,496.
Evidence of consumers not so credible as of abstainers, 19,283.
Witnesses questioned as to opium habit with view of shaking credit, 24,532–40.
Witnesses cross-examined as to habit to shake their credit, 27,474–78, 27,489.

CRIME:

Opium never used by any professional poisoner, 1110.
Jail statistics of the Lower Provinces show that out of 302,000 prisoners, not a single crime was attributed to opium, 1140, 1144.
Madak smokers commit petty thefts to obtain opium, 1145.
Not often connected with opium habit, 1464–68.
Connexion of opium with crime an entire fiction, 1557, 1603.
Consumers steal to gratify their craving, 1920, 1950.
One half of violent crimes committed under influence of opium, 1920, 1956.
Cannot be ascribed to use of opium, 2706.
Opium never leads to crime of any kind, 3184, 28,134. 28,141.
Excess does not lead to violent crime, 3413.
Opium gives rise to no violent crime, 3512, 3523.
Opium-eaters not prone to criminal offences, 3797.
Opium-eaters, as a rule, are not criminals, 3885, 3893.
Does not lead to crime, 4047, 4205, 16,655, 16,659, 18,752. 22,281.
Opium-eaters have a terrible dread of jail, 4498.
No connexion between opium and serious crime, 5080–97, 5104.
Opium habit not direct cause of crime, 5173, 7025.
Opium has no perceptible influence, 5463–66, 5495.
Smokers given to petty thefts, 5833, 5888.

CRIME *continued*.

Habit has no effect upon crime, 5947, 5964–66.
Seems to lead to petty thefts, 6420.
Only leads to petty theft, 6599–603.
Responsible for petty crime and theft, 6692.
Habit leads to petty thefts, 7004, 7015, 7043–47, 7401, 7445, 7461–64, 7542–45, 7578, 8325, 8478, 9129, 9130, 9161, 9164, 9173, 9850, 9927, 11,684, 13,283, 13,309–11, 16,660, 18,838, 20,047, 20,085, 20,153, 23,689, 23,875.
Primary source of crime in Arakan, 7990.
Opium-smoking Burmans take to petty theft, never to violent crime, 8095, 8114, 8115, 8170.
Abuse of opium does not lead to crime, 8763.
Habit generally leads to petty crime, 9417–24.
Less crime in Assam districts, where opium consumed than elsewhere, 9527–29.
Kania servants not kept on account of their thieving habits, 9962.
Petty thefts committed, not by reason of using opium, but in order to obtain it, 11,892, 11,921, 12,569, 12,570.
Neither directly nor indirectly the cause of crime, 13,685, 26,256.
Per-centage of crime attributable to opium unworthy of notice, 14,307.
Opium never directly or indirectly leads to crime, 14,414, 22,579, 22,598.
Opium-eaters less capable of crime than drunkards, 14,456.
Habit is a common cause of petty crime, 15,527, 15,530, 15,549–455.
Habit not connected with crime of burglary, 15,968.
No connexion with crime, 16,006.
Usually committed through want of opium, 16,658.
Causes no crime except petty theft to obtain it, 16,902.
Never committed under influence of opium, 18,795, 18,819.
Not traceable to use of opium, 19,316.
No connexion between opium and crime, 19,797, 19,820, 26,940.
Opium-eaters are not, as such, guilty of crime, 20,284.
Habit may lead to petty theft to procure the drug, *ib.*
Facilities of procuring opium, but not the opium habit, lead to its use in poisoning cases, 21,298, 21,376–78.
No crime is due to opium habit, 21,415.
Opium-eaters the minority among criminals, 21,813.
No cases of crime committed under influence of opium, 22,167.
No case of criminality originating in use of opium, 22,217.
Opium never instrumental in commission of crime, 22,385, 22,415.
Not a single case can be attributed to opium-eating, 22,496.
Chandu and madak smoking do not give rise to any crime, 22,547.
Petty thefts ascribed to habit committed to obtain opium, 22,893.
Opium-eaters rarely commit crime, 22,923.
Opium consumption not known to cause crime, 23,018.
Habitual moderate use does not lead to crime, 23,047.
No crimes or acts of violence can be traced to opium, 23,301.
Criminal poisoning with opium not common, 24,125, 24,147.
Opium-eating does not tend to commission of crime, 24,426, 24,452, 24,518.
Opium-eaters soon learn to steal and commit other crimes, 24,543.
Not known to lead to violent crime, 24,552.
Habitual use does not lead to heinous crimes, 24,626.
Opium may be the agent, but is not the instigator, 24,722, 24,774.
Opium does not lead to crime of violence or infringement of public decency, 24,905, ii. 411, 414, 416, 417, 437.
Opium-eaters conspicuous by absence of crime, 25,233, 25,405.
Opium does not lead to crimes of violence, 25,300, 25,343, 25,372, 25,583.
Madak-smoking leads to quarrels and crime, 25,511, 25,522.
Offences committed under influence of opium not known, 25,569.
Consumers only resort to petty theft and cheating to obtain opium, 25,657.
Opium is not an incentive to vice or crime, 25,797.

CRIME—*continued*.

Opium does not lead to crimes of violence, except in connexion with smuggling, 26,148.
Checks propensities to violence and crime, 26,407.
Tendency to make people criminal, 26,482.
Jail statistics show that consumers not among criminal classes, 26,612.
Experience of 30 years discloses no case of crime through opium, 26,652.
May lead poor persons to commit petty larceny to procure it, 26,940.
Indirectly, but surely leads to crime, 27,004.
Opium consumers are law-abiding and peaceable, 27,136.
Opium used for criminal purposes, 27,494.
Influence of opium never pleaded as excuse for crime, 27,566.
Smokers commit petty thefts to obtain opium, 27,597.
Police have no trouble through opium-eaters, 27,696.
Large per-centage of crime committed under influence of opium, ii. 315.
Effect of opium in inducing commission of crime doubted, ii. 603.
Rarely caused by opium; petty thefts committed to obtain it, iv. 380.
Never leads to violent crime, iv 381.
Comparative table of use of opium as a poison, iv. 453.

*See also* MORAL EFFECTS.

CULTIVATION OF POPPY:

Reduction in acreage under poppy, 40.
Statistics of acreage, 1880–81 to 1891–92, 44.
Poppy crop is very uncertain, 100, 2837, 11,017, 11,082–93, 11,436, 23,309, 23,333.
Total value of poppy crops in India, 872, i. 136.
Larger portion of production raised in the Native States, 906.
Total value of poppy crops Rx. 19,500,000, 888–90, 936.
Varies very much, and has been diminishing, 939.
Would probably be restricted if advances not given, 940.
Cultivation perfectly voluntary; no pressure exercised, 942.
Opium occupies only a decimal portion of cultivable land, 1057.
Poppy requires a great deal of manure and preparation; it is an expensive but not exhausting crop, 1550.
Poppy requires a great deal of water, 1581.
Would be greatly extended if free, 1613.
Produce of acre is diminishing; figures for 1848–73, 1771.
Impossible to restrict area if trade free, 2069.
Area under poppy in Bengal, 2086–100.
Policy of the Indian Government to restrict area, 2077, 2409, 2413.
Should be restricted to quantity required for medical use, 2465, 2477–81.
Should be licensed under Sir W. Muir's system, 2479.
Ryots have the idea that cultivation is compulsory, 2767, 2844–60, 2877–79.
Area should be restricted, 2785.
Cultivation not popular with the Natives, 2831, 2835.
No compulsion exercised, 2920, 2971–76.
Price would be much higher if trade open, 2922.
Chief advantage lies in security of return, 2927.
Government system of supervision in Benares, 2940–76, 2988–90, 2996–3020.
Average opium cultivator better off than cotton cultivator, 3003.
Opium only grown in sufficient quantity to pay rent, 3018.
Ryots never object to opium, 3196.
Even in bad years pays better than ordinary crops, 3230–34.
Magnitude of the interests bound up with opium, 3276.
Poppy would pay apart from opium, 3284–88.
Poppy land more highly rented than the other, 3289–95, 3300–4.
Area restricted by Government, 3296, 3297.
Compensation for improvements, 3305–10.
No necessity for restriction, 3979.
Crop brings in double normal amount, 4271.
Fixation of acreage under poppy, 5151.

CULTIVATION OF POPPY—*continued.*

Area under cultivation in Bengal, 1877–92, 5160.
Acreage under opium, 5251.
Opium is not an exhausting crop, 5258.
Cultivation of opium in India, 5251–54, 5258–74, 5287–325.
Crop profitable, and on the whole secure, 5514; if opened to public would cause enormous increase in production, *ib.*
Government should be more liberal in bad seasons, *ib.*
Pressure sometimes needed to make cultivators fulfil contract, 5519–34.
No compulsion needed to have sufficient quantity grown, 5547.
Government system of regulating quantity, 5571–76.
Stoppage would cause great distress, 5708–16.
Interests in the opium districts very considerable, 6123–35, 6154–59.
Poppy a valuable crop to tenants, 6186.
Not considered profitable now, 6276–80.
Some advantages in growing poppy, 6288–95.
Ryots cannot produce a crop paying like opium, 8498, 8499.
Agents have refused permission to grown opium, 8514.
Difficulty in getting cultivators to grow opium 10 years ago, 8516, 8517.
Compulsion said to be occasionally exercised by Opium Department in Behar, 8521–31, 8547–50, 8767–69.
Opium crop is very popular in Behar, 8766.
Maize diminishes the value of poppy land, 9290–92.
Statistics relating to the Patna division, 10,792–96.
Advantages of poppy crop, 10,796.
Argument that substitution of grain for opium would mitigate famine a delusion, 10,855.
Average profit from opium lands, 10,860.
Government exercises no pressure on ryots to increase cultivation, 10,909–11.
Magnitude of interest involved very great, 10,948, 10,949.
No compulsion or persuasion necessary, 10,966–68, 11,001–13, 11,117, 11,232.
Profits of poppy crop, 11,006, 11,096–109, 11,117, 11,129–31, 12,963, 16,042–46.
Poppy growers cannot always get two crops in a year, 11,031–33.
Chiefly in the hands of market gardeners, 11,044–46.
Government exercises moral compulsion, 11,052–60.
Statement that ryot is afraid to refuse to cultivate is untrue, 11,126–28.
Poppy grown near villages for convenience, 11,140–46, 11,166.
Cost of production of opium in Behar, 11,172–361.
Government order poppy cultivation, 11,353, 11,354.
Crop is profitable, 11,396–98.
Ryots willing to cultivate poppy if land suitable, 11,398, 11,402, 11,415.
Comparative cost of opium cultivation, 11,433, 11,439–43, 11,524–26, 11,661–68, 12,108–13.
Needs twice or thrice as much labour as any other spring crop, 11,439.
Indirect compulsion used by Government, 11,446, 11,498, 11,552.
Ryots threatened with prosecution for failing to cultivate after receiving advance, 11,446, 11,479, 11,494, 11,591–600, 11,622–34.
Have the idea that Government orders cultivation, 11,475.
Form of notice that advance has been sent and cultivation will be required, 11,489.
Opium-cultivating ryots poorer than others, 11,523.
Evidence collected by the Indian Association in Behar as to cost of production and oppression by sub-opium agencies, 11,706–85.
Comparative statement of profit and loss of poppy and potatoe crops, 11,712.
Form of license to grow poppy, 11,714.
Poppy cultivators very well off in comparison to other ryots, 11,905.
Ryots cultivate poppy at a loss, 11,953, 11,967–71.
Government exercises no compulsion, 12,081.
Poppy occupies 2½ per cent. of cultivated land, 12,114–17.
Main advantage is the Government advance, 12,118–21.
Area under poppy in Behar, 12,167.
Comparison of poppy with other crops, 12,167–86, 12,346, 12,357–59, 12,754–61, 12,796–98, 12,872–74, 20,695, 20,700–7, 20,714.
System under the Opium Department, 12,187–340.

CULTIVATION OF POPPY—*continued.*

Price of seed pays for cultivation without hired labour, 12,241–45.
Form of security bond, 12,265.
Failures occur, but not frequently, 12,289.
Poppy grown in almost every village in Gya, 12,375.
Landlords cannot compel ryots to cultivate poppy, 12,380–86.
Results of experimental growing in Behar, 12,445.
Poppy gives more trouble than indigo, 12,522, 12,523, 12,535–37, 12,558.
Ryots usually devote one-fifth of land to poppy, 12,535–37.
Area cannot be increased without permission of Government, 12,552, 12,553.
Peculiar soil required for poppy, 12,559.
Crop pays well and is much liked, 12,731, 12,732, 12,736–40, 12,754, 12,762, 12,763, 12,782, 12,791.
Direct compulsion unknown, 12,747, 12,748, 12,768–74, 12,792–95.
Poppy crop troublesome to cultivate, 12,750.
Cannot be grown on large scale by hired labour being subject to thieving at time of gathering, 12,783.
Risk from hail considerable, 12,784–87.
Grown on the homestead lands, 12,788–90.
Enables ryots to keep out of debt, 12,812, 12,835.
Beneficial to ryots as well as landholders, 12,848, 12,858–64.
No compulsion on part of Government, 12,875.
Very small per-centage of land under poppy, 12,880–83.
No penalties recoverable in Allahabad for failure to cultivate, 12,971.
Poppy one of the best paying crops, 12,987.
Some pressure exercised by Government, 13,039.
Thousands benefit by poppy cultivation, 13,414.
Ryots and landowners favourable to continuation of present system, 13,444.
Poppy utilises a man's whole family, 13,447.
Men struck off list petitioned for permission to sow again, 13,450.
Compulsion unnecessary on part of Government, 13,451.
Form of agreement to construct well on poppy land, 13,560.
Complaints not common; sometimes made, 13,585–87.
Ryots understand that they are absolutely free in the matter of cultivation, 13,606–9, 13,636, 13,639.
Involves great labour in comparison with the profits, 13,679.
Poppy cultivation in the Lucknow district, 13,693.
Advantage of employing whole of cultivator's family, *ib.*
No compulsion necessary, 13,695, 13,696.
Great advantage over other crops in steadiness of price, 13,725, 13,728.
Advantages of the present system, 13,943–50, 13,972.
Crop does not pay where hired labour employed, 13,956.
Interests involved in poppy cultivation, 13,981.
Government connexion with opium stimulates cultivation, 14,007, 14,030–35.
Would be less popular if Government advances withdrawn, 14,011–14, 14,034, 14,042, 14,043, 14,049.
Occasionally dropped if produce not good, 14,421.
Poppy popular because of sure return, 14,449.
Prohibition would entail loss on tenants and landowners, 14,462.
Present system a source of great profit, 14,493.
Cultivation entirely voluntary, 14,499–501.
Prohibition would entail great loss to cultivators, 14,808.
600,000 families engaged in poppy cultivation, *ib.*
Poppy crop profitable notwithstanding recent general rise in prices, 14,835–40.
Notification that cultivation is free unobjectionable, 14,842, 14,857, 14,858.
Highest importance to landlords and cultivators, 14,895.
Ryots understand that they are quite free to grow poppy or not, 14,917–19.
Industry of great importance, 14,914–16, 14,924–38, 14,950, 14,951.
Poppy crop is a loss to cultivator, 15,056, 15,063, 15,105, 15,195–97, 15,211, 15,212, 15,222.
Grown for advances, and under pressure, 15,058.

Cultivation of Poppy—*continued.*

Crop costs much labour and money, and exhausts the soil, 15,139.
Cultivation should be free, 15,267.
Present area sufficient, 15,301.
Best paying crop, 15,327–39, 15,346, 19,309.
Not so much labour as wheat, 15,348.
Cultivators keep a certain amount back, 15,388, 15,409–11.
Quotation from the "Pioneer," as to unwilling cultivation, 15,524, 15,556–61, 15,569, 15,570.
No change necessary beyond increase of Government price, 15,696.
Prohibition would be calamitous for the agricultural population, *ib.*
Ryots invariably eager to engage in it, *ib.*
No other crop so profitable as poppy, 16,019–23.
Great profit derived from poppy cultivation, 16,443.
No crop yields more than poppy, 16,523, 16,530.
Punjab system different to system in Behar and Benares, 17,369–72, 17,378–88, 17,390–92.
Given up in places through oppression of licensed vendors, 17,835.
Crop generally popular, 18,027–29.
Restrictions have considerably reduced cultivation in the Punjab, 18,442–48.
Rule forbidding consumption by a grower caused discontent among the Jats, 18,464.
Gives occupation to a large number, 18,610.
Petitions to be relieved from poppy growing, 19,093.
In favour of continuance of present system, *ib.*
Has been closed in many places without serious result, 19,100, 19,107–11, 19,149–53.
Closed through misconduct of cultivators or unfavourable soil, never through indisposition to cultivate, 19,117.
Cultivators always retain some opium for their own use, 19,136–38.
Licenses withheld in neighbourhood of towns without compensation, 19,140–42.
More popular with cultivators than landowners, 19,314.
Equitable claim for compensation on discontinuance of license, 19,339.
Value of poppy crop, 19,460–65.
Peculiar advantages of poppy crop, 19,535.
Reduction of area due to bad seasons, 19,561–64, 19,606, 19,607.
Rotation of crops, 19,635.
Undue pressure to cultivate poppy has not been used, 19,637.
Opium is the most valuable crop grown, 19,651, 19,777, 19,780, 19,815.
Grown by poorest class—by spade husbandry, 19,651, 19,665–72.
Advantages of the poppy plant, 20,413*a*.
Petition against Government compulsion, 20,444.
In favour of cultivation as an employment for women, *ib.*
Expenses per acre, gross value, and net profit to cultivator of poppy and other crops, 21,750, 21,751, iv. 402, 403.
Crop needs plenty of water, 21,970–72.
Most profitable crop for irrigated land, 23,309.
Cultivators fancy that they are ordered to grow poppy, *ib.*, 23,320–25.
Crop requires much labour; is expensive and risky, 23,309, 23,333.
Will cease to be so if price continues to fall, 23,309, 23,457, 23,475–85.
Will probably soon cease to be grown except when ordered by the authorities, 23,457.
Prohibition would entail great loss on the people, 24,627.
Opium is a very profitable crop, 28,053.
Poppy, one of India's most valuable crops, i. 133.
Revenue realised only part of value of crop, *ib.*
No one is forced to grow poppy, i. 134.
Refusal of licenses looked upon as a grievance, *ib.*
Yield per acre, and value, *ib.*
Annual value of crop in Bengal; area under cultivation; cultivators employed, i. 135.
License system in the Punjab, *ib.*
Acreage duty, area, and crop, *ib.*
Total annual value of Indian poppy crop, i. 136.
Covers less ground and is more profitable than any other crop, ii. 318.
Issue of licenses, ii. 320.
Method of cultivation, *ib.*
Area under cultivation, 1883–84 to 1892–93, ii. 344.
Analyses of manure and irrigation water, ii. 399.

Cultivation of Poppy—*continued.*

Map showing cultivation in British India, ii. 401.
Area under cultivation, 1882–83 to 1891–92, ii. 446.
No other crop so valuable as poppy, iv. 374.
People anxious to cultivate it, *ib.*
Statement showing initial value and cost of an acre under poppy, iv. 400.
Statement showing difference of profit per acre under poppy, wheat, barley, &c., iv. 401.
Comparative cost of poppy and other crops, v. 72–76.
Results of inquiry into allegations of undue influence, v. 354–61.

*See also* Advances, Substitutes for Poppy, *and under the various Provinces and Native States.*

Cure of Habit:

Excessive users experience great suffering in trying to overcome the habit, 221–24.
Eating habit more difficult to cure than smoking, 262.
Ninety-five per cent. resume habit on leaving hospital, 296, 299.
Smokers cannot give up the habit, 656.
Withholding opium from habitual consumers a very serious step; some consumers cannot leave off, 708–11, 714–21, 733, 740.
Stoppage causes helplessness and misery, 854.
Sudden withdrawal apt to lead to serious symptoms, 1470.
Moderate consumers can leave off as easily as tobacco smokers, 1471–75.
Excessive smokers fear they would die if habit left off, 1651.
Quite as curable as the drink habit; excessive users require medical stimulants, such as ammonia, 1674–76, 1683.
Requires strong will to break habit without medical treatment, 1736.
Confirmed opium-eaters never voluntarily leave off, 1920.
Cannot be given up without extreme suffering, 2251–53.
No one can give up the habit, 2593.
Impossible to conquer, 2758, 2759.
Harder to give up than drinking, 2816.
Difficult to give up, 3041, 4055, 6007–8, 8639, 17,015, 18,789, 20,318, 25,733.
Few men give up the habit, 3409, 3410.
Sudden stopping followed by diarrhœa, 3717–19.
Very few give it up, 4221; it requires much effort, 4222–25, 4261.
Requires strength of mind to break it off, 4645.
Three or four days' abstinence sufficient to stop craving, 4709.
No danger in stopping when not complicated by disease, 5172.
Cannot always be thrown off, 5505–7.
Can be relinquished, but with difficulty, 5828.
Almost impossible to give it up, 6328, 6360, 18,927.
Sudden deprivation dangerous, 6735.
Cannot be given up, 6985–87.
Cannot be left off for a single day, 7003, 7021, 7035, 7039.
Can be left off by use of medicine, 7048, 7066–69.
No more difficult to give up than alcohol, 7380–86.
Men have died of dysentery or diarrhœa when supply stopped, 7614, 7634, 7672–74.
Can only be given up under medical treatment, 7788–90, 7805.
Can be relinquished without injury, 9041.
Never given up except under compulsion, 9459–61.
Sudden cessation causes three or four days' discomfort, 9766–70, 9790.
Opium consumers cannot get through their work well without it, 9787–89.
Sudden stoppage would kill habitual consumers, 10,362, 10,375–79.
Extremely difficult, probably impossible, to relinquish, 10,613.
Can only be discontinued by gradual reduction of dose, 10,727.
If suddenly left off produces nausea, pains, general uneasiness, and diarrhœa, 10,753–56.
Smokers cannot give up the evil habit, 11,448.
Smoking habit much more difficult to keep under control than eating, 11,681.
More difficult to abandon than most other bad habits, 11,872.
Consumers suffer for about a week on leaving off, 12,517, 12,556.

CURE OF HABIT—*continued.*

Can be broken off by gradually diminishing the dose, 12,568.
Cannot easily be stopped, and in no case at once, 12,655.
Very difficult to give up at once, 13,014.
Jail experience shows that habit can be stopped without real danger, 14,307.
Cannot be broken off suddenly, 15,156.
No difficulty in giving up habit except in case of old habitual consumers, 15,959–62.
Can only be relinquished in the early stages, 16,547.
Excessive consumers suffer when they cannot get a supply, 17,367.
Consumers willing but unable to give up habit, 18,000–3, 18,024.
Great difficulty in relinquishing, 18,247, 24,362.
Can only be abandoned by use of medicine if of long standing, 18,299.
Sudden stoppage causes indigestion and eventually diarrhœa, 18,789.
Can be stopped without discomfort by gradually reducing quantity, *ib.*
Difficult to leave off, as it produces serious gastric disturbances, 18,819.
Cannot be easily relinquished, 19,001, 22,850, 23,688, 25,569.
Habitual consumers cannot do without opium, 19,066.
Consumers suffer from constipation when opium withdrawn, 19,190.
Only two or three in 1,000 leave off, 19,278.
Cannot be left off without physical distress, 19,318.
Consumers suffer a good deal at first when supply stopped, 19,400, 19,438.
Never left off, except under restraint, 19,905.
Can be relinquished, as in case of prisoners in jail, 20,047.
Consumers willing to give up, but fear the sufferings that ensue, 21,298.
Not so difficult to break off as alcohol; not much more difficult than tobacco, 21,420–32.
Youths frequently seek medical aid to break habit, 21,422.
No difficulty in reducing daily allowance, 21,882.
Very rarely discontinued voluntarily, 21,927.
Exceedingly difficult to get rid of, 22,217.
Partial stoppage attended with pains, nausea, &c., 22,579.
Discontinuance does not produce injury, 22,806.
Pain in leaving off a matter of degree, 22,931–33.
Consumers shrink from pain of giving it up, 23,309.
When confirmed, most serious consequences follow when supply stopped, 23,429, 23,451.
Can be stopped by gradually reducing the dose, *ib.*
Seldom given up except under compulsion, 23,457.
Consumers fear to leave off on account of suffering entailed, 23,715, 23,966.
Habit can be cured by medicine, 23,716–19.
Not difficult to leave off, 23,794.
Power to leave off depends upon firmness of mind, 23,811–17.
Physical results of sudden stoppage, 24,128.
Consumers can be weaned from habit by treatment, 24,129.
Statement that opium-eaters would die if supply stopped is groundless, as shown by experience in jails, 24,622.
Seems no harder to give up than tobacco smoking, 24,712.
However excessive, health always regained when habit stopped, 24,740.
If opium withdrawn suddenly, apparently dangerous symptoms come on, which disappear on administration of opium or other medical stimulant, 24,742.
Habitual consumers alarmed by the symptoms, cannot leave off the habit unaided, *ib.*
Can only be given up slowly and by gradually decreasing doses, 24,780.
Except where given up slowly, there is liability to use alcohol or hemp, *ib.*
Health of consumers regained when habit left off, 24,857.
Sudden deprivation of opium brings on terrible suffering for a few days, 25,295.
Sudden withdrawal produces misery, 25,340, 25,351.
Restlessness following withdrawal of opium, mostly due to memory of former effects, 25,342.
Supposed morphia injections, really water, remove the sense of misery, &c. *ib.*, 25,355–57.
Diarrhœa sets in on stoppage of opium, 25,354.

CURE OF HABIT—*continued.*

Sudden stoppage has resulted in temporary mania, in case of an excessive eater, 25,399.
Difficult, but not impossible, to give up, 25,667, 25,835, 26,805; tendency to resort to other drugs as tobacco, ganja, alcohol, 25,667.
No bad effects from discontinuance, 25,839.
No medicine or other agent required, 25,851.
No apparent desire to resort to other stimulants, 25,853.
Sudden stopping causes feeling of languor, 25,871.
Very difficult to give up; can be done without resort to other stimulants, 25,892.
Easily broken off, except when used for chronic disease, 25,910.
More difficult to give up than alcohol, 25,962.
Not so difficult to leave off as generally supposed, 25,990.
Sudden stoppage likely to lead to use of other narcotics, *ib.*, 26,004, 26,046, 26,063.
Habitual consumers find it impossible to give up, 26,063.
Often given up voluntarily, 26,384.
Smokers declare their inability to leave off, 26,436.
Inability to procure dose has brought on mania, *ib.*
Can easily be given up under restraint, 26,617.
Consumers would certainly take alcohol or any other stimulant at first stage, *ib.*
Can easily be given up by use of other stimulants, 26,678.
Causes distressful longing, with pain, which wears off in a few days, 26,717.
Stoppage not likely to be followed by use of other drugs, *ib.*
Produces sense of fatigue, weakened muscularity and diarrhœa, 27,138.
Broken off under compulsion without injury, 27,197.
Few have courage or determination enough to break it off without compulsion, *ib.*
Case of death through deprivation of opium, 27,345.
Sudden deprivation causes prostration, followed by diarrhœa, 27,387, 27,408.
Deprivation causes nervous depression within 24 hours, 27,511.
Habit cannot be stopped, 27,645.
Stoppage causes diarrhœa and prostration, *ib.*
Can be relinquished, but with greatest difficulty, 27,829.
Possibility of leaving off evidenced by experience with prisoners, *ib.*
Patients occasionally deluded into belief that they are getting opium; results satisfactory, *ib.*, ii. 415.
No difficulty experienced in gradually reducing dose, ii. 418.
Deprivation of opium causes misery and disease, ii. 461.
Horrors which consumers suffer when drug withheld are fearful, ii. 552.
Sudden stoppage of opium not likely to hurt; prisoners do not suffer, ii. 559.
Considerable temporary suffering entailed by sudden stoppage, ii. 605.
Deaths through sudden deprivation of opium, ii. 627.
Results of stoppage vary with amount habitually taken, iv. 506.
Observations on possibility of, and desire for, cure among consumers in Straits Settlements and Hong, v. 151, 154–209 (pars. 10 and 15); in China, v. 213–343 (pars. 10 and 14).
Smokers can break off habit, but rarely do so, v. 151.
Medicine prescribed in treatment, *ib.*
Morphine injection as cure for opium habit, v. 209–12.

CUTCH:

Consumption of opium by different races, 24,904.
History of opium arrangements, 24,911.
Arrangements regarding opium, ii. 356.
Quantity imported for home consumption, 1892–92, *ib.*

CUTTACK:

Consumption of opium, 4554–58.

## D.

DACCA:

Consumption of opium, 3695–99.

DECOCTION:

Sikhs use opium as a drink with their food, 2761.

DELHI:

Most of the people use it one way or other, 18,873–78, 18,890.
Thousands of people use opium, because of the moist climate, 18,903.

DENS:

Prostitutes always found in opium dens, 707.
Not one Indian in 10,000 has ever seen an opium den, 897, 981–84.
Half the people frequenting dens suffer from some painful malady, 1030, 1074–79.
Frequented by dregs of the population, 1162–65, 1170.
Frequented by outcasts, beggars, or drunken creatures, 1604–7; by debauched people, 17,424–31.
Frequented by criminals and bad characters, 1888, 1889.
Habitués condemn the practice of smoking, 1915–17.
Chinese opium dens mostly brothels, 2010.
Circular regarding suppression of licensed saloons, 2425–30.
Number increased by prohibition of smoking on licensed premises, 2765, 2772–81, 2864–76, 14,465, 14,522, 14,577, 14,602, 15,517, 15,548.
Chandu mostly consumed on the premises, 3071–98, 3105, 3106, 3140–46.
Madak and chandu shops being largely reduced, 3245–47.
Visits to dens in Calcutta, 3558–65, 3591–97, 8937–84, ii. 412, 413.
Madak dens should be closed, 4058, 4059.
Should be abolished, 4451, 4577, 4585–87.
Visit to a chandu smoking den, 4717.
Considerable number in Calcutta, 4913–19.
Frequented by idle fellows of all classes, 5469.
Suppression encourages establishment of smoking clubs, 5471, 5498, 5499.
Smoking dens should be suppressed, 5514, 5577–81.
Small smoking clubs should be under supervision, 5690–93, 5719–30.
Private smoking clubs should be prohibited if possible, 6403–7.
Opium saloons are particularly bad places, 7235.
Resort of criminals at Calcutta, 8608.
Madak shops and brothels usually in close proximity, 8645.
Statements regarding opium dens in Calcutta greatly exaggerated, 8672, 8696–99.
Prohibition of smoking in licensed shops has increased the number of opium dens in N.-W. Provinces, 13,691, 13,705–9, 13,735–39, 13,743–45, 13,781–86, 13,804–9, 13,819–26, 14,465, 14,522, 14,577, 14,602, 15,517, 15,548.
Surprise visit to the opium dens denounced by Mr. Caine, disclosed nothing objectionable, 14,353.
Evidence collected by visiting opium dens incomplete, 14,996–15,000.
Chandu shops resort of criminals, 15,673.
Illicit chandu shops still exist in the Punjab, 16,027–29, 16,048–52.
Dens in Umballa, 16,684–87, 16,693–709, 16,768–74.
Smoking should be made penal as unlawful assembly, 16,693–98, 16,747–49.
Generally frequented by artisans, 16,819, 16,820.
Visit to an opium den in Lahore, 18,210.
Suppression of licensed smoking shops forces smokers to go to the dens, 18,532, 18,553–57.
Should be abolished by law, 18,957–59.
Closing licensed shops encourages unlicensed ones, 19,5[illegible].
Opposed to the interests of licensed vendors, 19,567–[illegible].
Should be closed at once, 19,885
Opium smoked in dens in Ajmere, though contrary to law, 21,465, 21,480, 21,537.
Visit to opium dens in Ujjain and Ratlam, 23,333, 23,[illegible].
Visit to opium dens or clubs in Bombay, 25,912, 25,917a, 25,927, 25,934–47, 26,436, 26,444–59, 26,498, 26,[illegible]–14, 26,543, 27,697, 27,708, 27,753, 28,168, 28,169.
DENS—*continued.*

Tout alleged to be sent by the missionaries, 25,940.
Nearly all habitual smokers seen were criminals, 26,444–54, 26,482–86.
Frequenters belong to various classes, 26,560–67.
Should be made penal like keeping gaming houses, 26,656–58.
Visit to opium dens in Colombo, 27,511.
Visit to opium-smoking dens in Harda, 27,645.
Usually in proximity to licensed shops, 27,671–77.
Heard no outcry against smoking habit, 27,709.
Habitués realise the terrible curse of opium and are anxious for prohibition, 27,753.
Habitués unanimous in condemning smoking, 28,168, 28,169.
A few children smoking; none under 12 or 15, *ib.*

DIETETIC VALUE:

Absolutely unsuited for dietetic purposes, 695.
Enables people to do with less food, 703, 1005, 1091.
Value as an aid to digestion, 3723, 3759, 3763.
Opium preferable to alcohol, 3817–21.
Improves digestion and keeps up vital powers, 3943.
Native physicians recommend its use, 4067.
Opium never recommended, 4166.
Used in moderation late in life, 4242.
Not prescribed for daily dietetic use, 4431–39.
Dietetic use of opium, 4693, 4697–99.
Opium not recommended as a dietetic agent, 4732–36, 13,911–17.
Has no dietetic value, 5833.
A little opium before starting, enables a coolie to go all day without food, 10,038.
Use as a dietetic interferes with its medical usefulness in certain diseases, 10,146–51.
Saved many lives in time of famine, 11,893, 11,941–48.
Value as a dietetic an argument against restriction, 11,899, 11,902.
Not usually so recommended by medical men, 11,924–27.
Has some dietetic value, 12,479, 12,486–92.
Useful for those who have not sufficient food, 14,232, 14,262–67, 14,272–79, 14,295–97, 14,325–32.
Aids digestion of rich food, 17,693, 17,730.
Few grains daily does no harm, 22,496.
Induces appetite, and aids digestion, 22,579, 22,598.
People of Kathiawar use opium for dietetic purposes, 25,133.
Opium does not interfere with digestion, 25,407.
Seems to create a taste for food like ghi, *ib.*
Beneficial to poor ill-fed Natives, 25,902.
Enables a poor man to tide over the loss of a meal, 26,032.
Opium-eaters digest milk, solid food, and fruits, with perfect ease, ii. 413.

DISCONTENT:

Inadequate compensation would engender a sense of injustice, 900.
Prohibition would be actively resisted by the warlike races, 1153; would make Native States disloyal, 1544.
Fresh taxation would rouse indignation and discontent, 2708.
Compulsion would necessitate an enormous increase in the army, 2936, 2937.
Prohibition would produce universal disaffection, 5739.
Fresh taxation would create great discontent, 5953, 5954.
Prohibition would cause embarrassment and discontent, 8409.
Prohibition accompanied by increased taxation would cause serious discontent, 10,846, 10,847, 11,392.
Prohibition would cause widespread dissatisfaction, 12,934.
Would sow seeds of discontent among the people, 13,845.
Existing serious disaffection would be increased by prohibition, 13,877, 14,356.
Appointment of Commission has tended to unsettle minds of the people, 14,059, 14,066–70, 14,075.
Assertion that abolition would result in discontent and disaffection is absurd, 14,548–53.
Punishment for statutory offences under legislative prohibition would cause great discontent, 14,852.
Prohibition would cause great discontent, 14,912.
Increased taxation would cause still greater, 14,913.
Discontent would not amount to political danger, 15,157.
Prohibition would cause discontent, being absolutely unnecessary, 15,392, 15,437.

DISCONTENT—*continued.*

Prohibition might lead to popular revolt, 15,915.
Would entail danger to the Government, 16,019, 16,024.
Prohibition would cause a great deal of discontent, 17,157.
Prohibition would probably lead to rebellion, 17,233.
Would only be temporary and could be provided for, 17,910, 17,981–83.
Prohibition would not cause riots or disturbance, 18,036, 18,107, 18,206, 18,307.
Prohibition would create an alarming amount of discontent, 18,147.
Prohibition would certainly create disaffection, 18,615.
Would be exceedingly hazardous, 18,622.
Prohibition would give rise to some discontent, but not political trouble, 19,006.
Prohibition would be a cruel act and would give rise to most serious discontent, 19,235.
Nothing to fear from the Natives in respect of prohibition, 19,289.
Prohibition would give rise to very deep discontent, 19,347.
Effect of prohibition impossible to contemplate calmly, 19,530.
Abolition of monopoly would cause great discontent, 19,648.
Prohibition would give rise to great discontent, 19,781, 19,820.
Opium consumers grumbling would not affect the Government, 20,137.
Undue interference would be dangerous to British rule, 20,768, 20,772.
Interference would cause disaffection; would be regarded as prelude to interference with social customs, 21,655, 22,217.
Attempt to stop poppy cultivation would involve risk of civil war, 21,814.
Prohibition would cause great discontent in Central India, 22,162.
Prohibition would produce political danger in Indore, 22,202.
Would be very serious, perhaps amount to political danger, 22,496.
Would supply all castes and creeds with a common grievance, 22,581.
Total prohibition would create an outcry among consumers, 22,796.
Prohibition would make British rule very unpopular, 23,104.
Interference would result in grave complications, 23,186.
Prohibition would inevitably arouse great discontent, 23,261, 23,294.
Would be insignificant in South India, 23,359, 23,376.
Prohibition would lead to breach of peace in Native States, 24,001, 24,016, 24,375.
Total prohibition or even further restriction will produce general discontent, 24,391, 24,408, 24,470.
Nothing but large armed force could prevent cultivation in Native States, 24,577.
Prohibition would cause serious discontent and political danger, 24,907.
People will certainly be discontented if opium prohibited, 25,081, 25,102.
Prohibition would produce dissatisfaction among Native rulers and farmers, 25,196.
Prohibition would cause much irritation and dangerous feeling, 25,226.
Interference would give rise to general dissatisfaction, 25,964.
Total prohibition would cause organised opposition in Gujarat, 26,149.
Would invite a general rising against a cruel and causeless oppression, *ib.*, 26,159.
Prohibition would cause a certain amount of discontent, 26,257.
Not the least fear that opium consumers will rebel if use prohibited, 26,286.
Opium agitation particularly unfortunate in present state of unrest, 26,705, 26,777.
Idea that prohibition would produce general discontent is a myth, 26,899.
Suggestion of possible trouble through prohibition ridiculed by smokers, 27,004, 27,007–10.
Repressive legislation would cause dangerous discontent, 27,036.
Change would risk safety of the administration, 27,699.

DISCONTENT—*continued*.

Prohibition would occasion such discontent as would constitute a serious political danger, i. 143.

*See also* NATIVE STATES, PROHIBITION.

DISEASES:

Statistics of diseases in opium-consuming provinces, ii. 445.

Table showing different diseases for which patients were admitted to Yeang Wah Hospital, 1893, opium-smokers being distinguished from non-smokers, and the deaths of each, v. 351, 352.

*See also* MEDICAL STATISTICS, PHYSICAL EFFECTS.

DOMESTIC REMEDY:

Much used among the people as medicine, 2374–78.
Largely used as a domestic medicine, 3204.
Used as a domestic remedy, 3338.
Common to most houses, 3589.
Bad impression of use as a domestic remedy, 4038.
Used domestically: medical advice not within reach of bulk of people, 4208.
Little used as domestic medicine, 4285.
Eaten, and used for external application, 4574.
Poorer classes take to opium from tradition, 5986, 5987.
Great value to people of India, 6165.
Only real sedative known to Burmese, 6690.
Greatly used as a domestic medicine, 6943.
Not believed in as a remedy, 7248–52.
Used by Burmans as a domestic medicine, 7367–69.
Opium used without medical advice, 8509.
Opium taken as a domestic medicine in Assam, 9017.
Common medicine among lower class Assamese, 10,362.
Remedy available to everyone under present system of sale, 10,399–403, 10,425.
Used for elephantiasis without medical advice, 10,638–41.
Cheapest home prophylactic in malarial places, 11,893.
Popular use of opium beneficial on the whole, 11,899, 11,903, 11,904.
Used largely in the villages, 12,347, 13,918.
Not safe as a domestic medicine, 12,585.
Much used for minor ailments by Mahomedans, 12,623, 12,624.
Common remedy for rheumatism, dysentery, and pains, 12,693, 12,694.
People often take it without proper advice, 13,111, 13,239.
Used a great deal, especially in treatment of children, 14,187–90.
Much used by people beyond reach of medical advice, 14,232, 14,813
Use practically universal, 14,304, 21,905.
Few houses in which opium is not kept as medicine, 14,905.
Sometimes used for cold, bowel complaints, &c., 15,385, 15,386.
Only remedy within the reach of the cultivators, 15,954.
Poppy heads used by poor people for inflammation of eyes and as fomentations, 15,970.
Used as a remedy by numbers of Native women, 16,116.
Commonly used for colds and rheumatic pains, 16,622–24.
Known to be a remedy for curing pain, 16,678–80.
Commonest domestic remedy, 16,859. 19,425.
Taken for almost everything, 16,861.
Women keep it in the house for the children, 17,000.
Common remedy and stimulant, 17,165–70.
Considered a valuable domestic medicine, 17,442.
Occasionally used as a domestic medicine, 17,509–11, 17,618–20.
Used by the people as a medicine, 17,882.
In general use in some parts of the country, 17,949, 17,952.
Not used as a domestic remedy in Lahore, 18,322.
Used as a domestic medicine by the Sikhs, 18,433.
Opium in common household use, 18,504.
Used to a large extent as a household remedy for rheumatism and diarrhœa, 18,851, 18,852.
Most of the people in Delhi use opium in one way or other, 18,877–78, 18,896.
Common remedy for sore eyes, sprains, dysentery, &c., 18,997.
Most important and effective remedy in use, 19,422.

DOMESTIC REMEDY—*continued*.

Domestic use assigned as reason for the habit, 19,976–78.
Used for external applications, pains, &c., 20,110–13.
Opium regarded as a panacea, 20,173.
Common household remedy throughout Rajputana, 20,271.
Used by poor people in out-of-the-way places, 20,323.
Popular remedy where there are no dispensaries, 20,855.
Very common household remedy, 21,330.
Used as a remedy for rheumatism and pains, 21,396, 21,412.
Most widely used household medicine, 21,418.
General household remedy of all castes, 21,577, 21,590.
Opium regarded as a household medicine, 22,015.
Villagers miles away from any hospital find a remedy in opium, 22,176.
Used as a domestic remedy in Malwa, 22,290*b*.
Mode of administration as a domestic medicine, 22,385.
Best friend of the poor in disease, 22,599.
Kept in almost every house as medicine, 23,046.
Used as a family medicine by others than habitual eaters, 23,261, 23,294.
Largely used as a pain soother, not as a cure for disease, 23,470.
Largely used in the villages without medical advice, 23,687, 23,733.
Poppy heads largely used as medicine, 23,874, 24,116, 24,627.
Commonest remedy used by Natives, 24,075.
Used for dysentery and diarrhœa without medical advice, 24,342.
Used for cough, asthma, &c., 24,453.
Largely taken in small villages where medical aid cannot be got, for ailments accompanied by pain, 24,518.
Use as a domestic remedy should be left to the discretion of the consumers, 24,924.
All classes and castes believe in opium as a family medicine, 25,283.
Remedy for people who cannot afford medical advice, 25,569, 25,583.
People sometimes doctor themselves with opium, 25,771.
Commonest of all household remedies, 25,901, 25,907.
Used for relief of pain and as an astringent, 25,953.
People take to opium instinctively for relief of pain, 26,614, 26,639.
Common domestic remedy throughout Gujarat, 26,647.
Villagers and poorer classes in towns use opium as a panacea for all diseases, 26,650, 26,714.
Used for centuries as a household remedy, 27,135.
Not a common household remedy in Berar, 27,250.
Use customary in almost all families, 27,939–404.
Opium a self-prescribed medicine, 27,469.
Not much used, except for children, 27,690.
Largely used to relieve pain, 27,722.
People use opium for all sorts of pains, 27,975.
Cheapest and best available medicine, 28,048.
Often used for external application, 28,087.
Not kept in houses of the poor as a medicine, 28,158.
Opium is the medicine of Bengal, ii. 318.
Saves many lives as a domestic remedy, ii. 409.
Employed by all classes, iv. 505.

DOSE:

Amount consumed by occasional and habitual users, 221.
Average amount used by smokers, 1088.
Impossible to fix the amount, it varies so, 1115–19.
Amount smoked by Chinese, 1877–80.
Quantity consumed daily, 3608, 3636–42, 4027–32, 4196, 4273, 4706, 8805, 9258, 12,469, 12,479, 12,495, 12,688, 12,713, 12,901, 12,904, 14,101, 15,492, 15,749, 15,806, 15,882, 15,947–55, 16,443, 16,456, 16,516, 16,523, 16,592, 16,959, 16,969, 16,982, 17,151, 17,179, 17,205, 17,625–34, 17,891, 22,577, ii. 551.
Quantity taken daily by different races, 3874.
Average amount and cost, 5831, 5864–73, 15,144, 15,152–55, 15,183, 19,498, 19,546–48.
Amount for eaters and smokers, 7005–10, 7108–11, 7125, 7136, 7146, 7161–63.
Amount taken by Sikh soldiers, 7495–97.
Quantity and price in Assam, 9727–33.

Dose—*continued.*

Average consumption per head, 10,099, 10,145–49, 10,182, 10,183.
Amount for moderate consumers, 13,097, 22,385, 25,373, 25,378, 25,398, 25,566, 27,450, 28,141.
Amount consumed by soldiers on active service, 15,916–19.
May be divided into small or stimulant and sedative, 16,843.
Sometimes enormous, 16,902, 27,282.
Amount taken by moderate and excessive consumers, 18,795, 18,805, 22,652, 26,060.
Daily consumption of ordinary opium-eaters, 19,533, 24,551, iv. 378.
Amount for children and moderate users, 19,797, 21,073, 21,082, 21,116, 21,974.
Ordinary dose for habitual consumers, 20,274, 23,031–35, 23,085, 23,110.
Amount of normal dose doubtful, 21,870.
Normal amount for beginners, 23,063.
Minimum and maximum dose, 23,790.
Maximum daily dose of a moderate consumer, 24,126.
Daily amount taken without injury, 25,861, 25,885*a*.
Usual methods of exhibition, 27,137.
Daily allowance for male and female consumers, ii. 416, 436, 437.
Statistics of 215 cases, ii. 418; of 613 cases, ii. 436.
Amount consumed by Chinese and Burman smokers, ii. 606.

Drink:

*See under* Alcohol.

Drinking:

*See under* Amal Pani, Decoction, Kasumbha, Post.

Druggists' Licenses:

English system not sufficiently restrictive, 115–18.
System of druggists' permits, 3219–26.
Sale allowed for medicinal purposes only, 4885–96, 4952–56, 4970, 13,129–39, 13,147–55.
Not necessary for sale of arsenic, 14,082–84.
Free licenses obtainable for opium as medicine, 19,531, 19,556–60.
Shops selling poisons generally confined to towns, 22,722–32.
Licenses for sale of opium and its preparations, and poppy heads, ii. 348–53.
System of licensing in Bengal, ii. 427.
No licenses refused during last five years, ii. 454.

*See also* Licensing, Sale, Vendors—Official.

Dungarpur:

Calculations showing comparative value of poppy and wheat crops, 21,637.
Produce and export of opium, *ib.*
Loss to State and individuals if poppy prohibited, *ib.*, 21,645–52.
Prohibition would lead to disturbance among the Bhils, 21,641–44.
Compensation would not induce people to stop poppy growing, 21,644.
Opium sent to the scales at Ahmedabad, 21,651.
Statistics of poppy cultivation, iv. 392.
Estimated loss to the State, &c. if prohibited, iv. 393.

*See also* Native States.

Dutch East Indies:

Consumption and imports of opium, 1890–92, v. 344.
Supply purchased at Calcutta sales and in Europe, *ib.*
Smuggling not sufficiently checked, *ib.*

Duty:

*See under* Licensing, Pass Duty, Sale, *and the various Provinces and Native States.*

## E.

Eating:

Eating habit more difficult to cure than smoking, 262.
Stronger than smoking, 1176.
Moderate eaters comprise the people of finest physique, 1602.
Vast majority of Indian opium-eaters take it moderately, 3401–5.
Injurious, but less so than smoking, 5913, 6340, 6341.
More common than smoking, 5948.
Equally as bad as smoking, 9457, 9458.
Opium-eaters as a class cannot work in water, 10,725, 10,726, 10,734.
Effects of excessive use, 10,727.
Clear distinction between smoking and eating, 19,527.
Eating at first increases the appetite, 21,991.
Diseases solely due to opium-eating not common, 24,678.
Emaciation noticed in opium-eaters often due to chronic disease, 24,740.
No particular pathological change or tissue destruction found in opium-eaters, 25,296, 25,332.
No admissions to hospitals from opium-eating alone, 25,322.
Opium-eaters able to work in water, 25,933.
Emaciation of opium-eaters heard of but not seen, 26,383, 26,386.
Opium-eating harmless, except when eater deprived of his usual supply, 27,387.
Opium-eating not a vice; often a necessity, i., 140.
Statistics relative to opium-eating, ii. 436, 437.
Eating more deleterious than smoking; results in death from dysentery, ii. 597.
Poorer classes of Chinese swallow opium dross, v. 149.
Much greater evil than moderate smoking, v. 328.

*See also* Effects, Popular View of Habit, Prevalence, Smoking.

Effects:

Opinions of Indian officials, 85–93.
Opinions of the medical profession in the United Kingdom, 240; in India, 241; in China, 243.
Evils are not serious in India, 2055.
Evils of opium hardly noticeable, 3490.
General statement on the opium habit, 4386.
Detailed statement of effects, 4645–73.
Evils of opium greatly exaggerated, 16,926–30, 16,935, 24,305.
Pernicious effects, result of conditions which have caused malaria, 24,881.
Sixty years' personal experience of the habit, 25,159.
De Quincey's view of the opium habit, i. 138.
Effects of habitual use of opium on the constitution, ii. 407–25.
List of 215 opium-eaters, ii. 423–25.
Report on evils of opium habit, ii. 561.
Abstracts of evidence of witnesses not examined, iv. 448–54.
Interviews with opium-eaters, iv. 506.
Précis of evidence of opium-eaters and other witnesses not examined, iv. 508–10, 523, 524.

—— Beneficial:

Smoking practically harmless, drinking opium-water not only harmless but beneficial, 1005, 1067–79.
All functions of life better performed under its influence, 1637.
Opium enables people to leave off drinking, 2010, 4442, 20,433, 21,082, 21,116, 22,597, 25,378, 25,865.
In moderation does far more good than harm, 3704–6, 10,099, 10,145.
Increase of consumption would be beneficial, 4426–29.
Opium taken moderately, after 40 years of age, rather benefits than injures, 5327.
Highly beneficial in moderation, 8405–7.
Moderate use beneficial, 12,467, 12,479, 12,490, 16,685, 21,765, i. 141, 146.
Moderate use with nourishing food beneficial, 12,935, 12,939, 12,980.
Prolongs life of sickly people, 13,661.
Beneficial to weak and sickly people, 13,674.
Moderate consumption exercises distinctly beneficial influence, 15,907, 27,885.
Generally benefits people who can afford rich food, 18,427.
Use beneficial in every respect, 18,795.
Beneficial on the whole, 19,426.
Judging from known cases, rather beneficial than otherwise, 19,489, 19,500–14.
Inestimable boon to the labouring classes; keeps consumers away from drink, and reclaims from liquor habit, 20,423.
Does a certain amount of good among underfed people, 21,045.
Useful to cultivating and labouring classes, 21,073, 21,082.

EFFECTS, BENEFICIAL—*continued.*

No harm, but good, results from moderate use, 21,443.
Moderate use beneficial and conducive to health, 21,812, 28,026, 28,118.
Evils from abuse fifty times over compensated for by benefits, 21,947.
Moderate use harmless, beneficial, and necessary, 22,031.
Beneficial, if accompanied by good food, ghi, sugar, &c., 22,579, 22,598.
Good effect in keeping people from alcohol, 22,715.
Moderate use improves rather than undermines the physique, 23,046, 23,581, 23,595.
Use in moderation as relief from pain beneficial, 23,875.
Moderate use prevents sluggishness, 24,206.
Moderate consumption advantageous, physically and morally, 24,510, 27,606, 27,619.
Beneficial on the whole, particularly to ill-fed, badly clothed and housed people, 24,720.
Moderate use followed by nutritious food not injurious, but conducive to health, 24,905.
Moderate use beneficial in disease and old age, 25,012, 25,100.
Fifteen years' moderate consumption has had beneficial effect on health, 25,166–91.
Moderate use improves the mental faculties and sustains weak constitutions, 25,194.
Intellectual faculties improved, and power of endurance increased by moderate use, 25,399.
Moderate use has a wholesome effect, as seen in case of peasants and boatmen, 25,568.
Does not interfere with digestion, produce wasting, impair procreative powers or bodily activity, depress or shorten life; gives good sleep, enables fatigue to be borne, deadens pain and craving for food, increases endurance, keeps the consumer lively and of equable temper, 25,656.
Moderate use is not harmful, but beneficial, 25,790.
Physique improved, and moral condition not lowered, by moderate use, 25,860.
Beneficial effect of moderate use on moral and physical condition, 26,407.
Opium acts as a benefactor in keeping people from the liquor shops, 26,416.

—— HARMLESS:

Effects on agricultural population not visible, 695.
No evidence to show that the people have suffered, 897.
Not generally injurious to races of India, 901.
Habitual use neither injurious, degrading, nor immoral, 1153.
Cases of suffering from use of opium unknown, 1155, 1156.
Habitual use of opium not injurious, 1182.
Moderate use does not seem to have much effect physically, 1286, 1382, 1558.
Little worse than tobacco smoking, 1481, 1488.
Has no deleterious effect on public health, 1601, 1608.
Moderate use produces no ill effects, 2706, 12,514, 14,414, 17,422, 17,442, 17,486–94, 19,883, 19,890, 22,757, 22,780, 22,832, 22,850, 23,795*a*, 23,824, 26,711.
Mischievous effects confined to sot, drunkard, and excessive user, 3684–88.
Moderate use does not affect health, 3965–73.
Effects not marked, 4251.
Not injurious in moderation, but requires strength of mind to break it off, 4645, 5505–7.
Moderate use is not injurious, 4975, 15,490, 15,846, 15,965, 16,007, 16,261, 16,330, 17,654, 23,556, 24,675, 27,731, 28,124.
Does not incapacitate people for work, 4990, 4993, 12,347, 14,062, 19,527, iv. 380.
Consumption is not prejudicial, 5612.
Moderate use is not harmful, 6066, 11,392, 13,843, 14,456–59, 15,045–47, 15,443–49, 19,646, 22,356, 23,184, 24,123, 24,184, 24,202, 26,652, i. 141.
Perfectly harmless in moderation, 6163.
Not injurious unless indulged in to excess, 8483, 9972–75.
Does not do harm in moderation if consumer has sufficient food, 9973.
Not injurious unless when taken in conjunction with alcohol or ganja, 12,681, 12,683.
Moderate use produces no bad effects on the physical and moral condition, 13,677, 13,681, 22,715, 22,745, 22,869, 22,909, 25,110, 25,824, 25,841, 25,[illegible], 25,902, 25,951, 25,986, 26,057, 26,612, 27,885.
Moderate consumption not prejudicial, 13,882.

EFFECTS, HARMLESS—*continued.*

Does no appreciable injury when taken in moderation, 14,226.
Moderate use not ordinarily attended with ill-effects, 14,351.
Not injurious to those who can afford rich food, 15,610, 15,611.
Opium-eating much like tobacco smoking, 17,229, 17,335.
Effects scarcely perceptible, 17,250–53, 17,334, 17,337, 17,368.
Use is useful and abuse injurious, 18,606.
Not injurious unless carried to excess, 18,687.
Moderate use exercises no deleterious influence, 19,228, 23,261, 23,294, 26,256.
Consumers not disabled from transacting business, 19,331.
Practice not harmful if accompanied by nourishing diet, 19,400.
Does not cause physical deterioration in small quantity, 19,675.
Does not appear to exercise any injurious effect, 19,749, 19,815, 19,877.
Moderate use does no perceptible injury if accompanied with nourishing food, 19,757, 19,820, 20,047, 24,216, 24,235, 24,327, 27,569.
Not a virtue; sometimes does good, 20,935, 20,965.
Moderate use does not cause any general or physical deterioration, 21,879.
Cultivating classes take opium without bad effects, 21,942.
Absolutely harmless; no death from opium for 20 years, 22,217.
Decidedly a vice, but a harmless one, 22,236, 22,350.
Merely a bad habit like tobacco smoking, 22,272.
No physical degeneration consequent on use of opium, 22,277.
Consequences do not appear to be injurious, 23,018.
Moderate use has no baneful effect, 23,751, 24,452, 24,497, 24,658.
Does not corrupt the physical condition if used moderately, 23,777.
Consumers suffer only when taken in excess, 24,468.
Moral and physical condition of consumers satisfactory, 24,518, 24,552.
Moderate consumption is utterly harmless, 24,797.
Too much strong food is worse than opium-eating in excess, 24,859.
Consumption is not excessive, and has no bad effect, 24,970.
Perfectly harmless in moderation; has favourable effect on the intellect and system, 25,060.
Moderate consumers physically strong and well able to work, 25,134.
No evidence that moderate use is deleterious, 25,322.
No effects on physique or general health noticeable, 25,340.
Moderate use harmless to any class of people, 25,412.
Small doses produce no effect whatever, 25,954.
Moderate use does not debase or degrade; enables toil and fatigue to be borne, 26,022.
Absolutely no effect on physical or moral health, 26,377, 26,385.
As good, or as bad, as taking tea, 26,393, 26,400.
Never cause of injury or moral depravity, 26,757.
No reason to suppose that opium, as used, does harm, 27,031, 27,461.
No experience of evil effects, 27,583.
Moderate non-medicinal use not deleterious, 28,017, 28,046.
Moderate use not necessarily prejudicial, i. 142.
No injurious results visible on the mass of the people, ii. 316, 409.
No deteriorating effect on physical or moral condition, iv. 506.
Moderate use in middle age produces no bad effects, v. 124.

—— DOUBTFUL:

Risky, not advisable for healthy people, 13,895–97.
Not recommended for healthy young men, 17,475, 17,718–22, 17,813, 17,841–45, 20,243, 23,771, 23,782, 23,829, 24,032, 24,075, 25,165, 25,183, 26,415, 26,785, 27,488, 28,120.
Not advisable for young people, 21,251–54.
Not recommended for young people, 21,921, 28,041, 28,060.
Not recommended as a custom, 21,976
Not good for healthy persons, 22,806.
Moderate use not deprecated, 23,018, 23,048.
Not approved as a habit for young men, 23,021–25.

EFFECTS, DOUBTFUL—*continued.*

Not supposed to be beneficial to young men, 23,117.
Habit should not be contracted for non-medical purposes, 23,949, 25,512.
Undesirable for healthy young men, 24,487, 24,497.
Not advisable for persons in good health; only useful in weakness or disease, such as dysentery, diarrhœa, &c., 25,801–11.
Appears to do very little harm, v. 126.

—— UNFAVOURABLE:

May be carried to such excess as to be injurious, 5612.
People of active habits eschew opium, 9318.
Injurious, if not accompanied by good food, 12,391, 19,837, 20,858, 20,913, 22,385, 22,456, 22,496, 22,917, 23,309, 23,359, 23,382, 23,457, 23,511, 23,609, 23,657, 26,586, 26,770, 26,801, 28,124, 28,134.
Results of habit bad physically, mentally, and morally, 13,191, 13,196–98.
Beneficial effect of moderate use a revelation to people of England, 16,848.
Bad, but does not cause the destruction ascribed to it, 16,902.
Taken as a habit, opium is a bad thing, 17,512–18, 19,274–77.
Effect less marked when accompanied by good food and milk, 18,927, 20,857, 21,991, 21,996–98.
Excessive consumers incapable of sustained exertion, 19,391, 19,400.
Deprives men of one-fourth of their usefulness, 21,298.
Generally discountenanced by medical men, 21,379.
Effect on moral and physical condition not good, 22,793.
Excessive use not beneficial, 24,362, 24,374.
Not believed to be good under any circumstances, 24,543.
Habitual use is in no way a good thing, 24,622, 24,640.
Habit cannot be called a good one, 24,971–75, 25,001–5.
Excessive use renders a man idle, listless, and unfit, 26,256.
Only a pleasure for six months to two years, 26,436.
Consumers may be strong in spite of opium, but not as a result of it, 26,542.
Produces unfavourable effects, v. 127.

—— INJURIOUS:

Excessive use is deleterious, 1020, 1285, 1641, 16,688, 18,606, 18,687, 24,675.
Excessive consumption undoubtedly harmful, 1132, 12,566, 12,597, 12,598, 18,904, 25,300.
Seventy-five per cent. of the consumers feel the injurious effects, 8609.
Causes dulled moral perception, emaciated body, and sleepy intellect, 8641.
Habitual use injurious, 8725, 19,274–77, 25,510.
Possibly thousands suffering from using opium, in India, 8735.
Slowly but surely working harmful effects, especially among poorer classes, 8805.
Abuse of opium highly injurious, 10,205.
Opium is a poison in excess, 11,516.
Injurious results apparent in 80 per cent. of consumers, 12,660; in 10 per cent., 13,025.
Even moderate use if habitual, is injurious, 16,281, 16,282.
Effects bad generally, especially on young men, 17,898.
Injurious even in old age, 17,947, 17,996.
Ninety per cent. of consumers suffer from the habit, 18,057–60.
Injurious results in all cases; postponed for a time by good food, 18,194.
Affects consumers especially; also people at large, 18,210.
Effects on people under 40 and 45 very bad; useful for phlegmatic constitutions above that age, 18,294.
Use by youths for immoral purposes, very injurious, *ib.*, 18,306, 18,311–13, 18,317–20.
Does serious injury to those who use opium as an intoxicant, 18,436.
Habitual use is injurious to young people, 18,899, 18,907, 18,930.
Habitual excessive use is injurious, 19,001, 19,009, 19,022, 19,029, 19,032.
Injurious to health generally, and to young people particularly, 19,885, 19,893.
Very dangerous, if unaccompanied by rich food, 20,343.

EFFECTS, INJURIOUS—*continued.*

Immoderate use very harmful, 20,769.
Moderate doses not beneficial, but rather injurious, 21,303.
Evil effects invariable, especially among poorer classes, 21,383.
Certainly injurious, especially among poorer classes, 21,465.
Excessive use causes physical and especially mental deterioration, 22,022, 22,055, 23,875.
Does harm if immoderately used, 22,308.
A blight and a curse on the country, 23,539, 27,339.
Excess ruins the body, 23,556.
Excess acts like poison; even moderate use gives rise to diseases, 23,908.
Injurious to poor people who do not get good food, 24,202, 24,216, 24,235, 24,327, 24,426, 24,484, 24,543.
Does most harm in dry climates, 25,552.
Unless prescribed medically, both use and abuse are baneful to moral and physical condition, 25,725.
Taken in excess, opium is injurious and poisonous, 25,827–34.
Excessive use baneful, mental and bodily, 26,040.
Opium does a great deal of harm, 26,120.
Well-nourished and well-housed people do not show effects so soon, if at all, *ib.*
Worst possible effects on poor ill-fed people in overcrowded localities, *ib.*
Effects are evil, physically, mentally, and morally, 26,286, 26,518.
Evil effects much more apparent in those who have used opium long, or in large quantities, 26,286, 26,328–33, 26,518.
Excessive use very injurious to ill-fed people, 27,017–20.
Effects injurious, but habit cannot be stopped, 27,645.
Decidedly injurious to young persons, 28,124, iv. 375.
Evil effects only seen in excessive eaters and in smokers, 28,141.

*See also under* EATING, MENTAL, MORAL, *and* PHYSICAL EFFECTS, SMOKING.

EGYPTIAN OPIUM:

Contains 7 to 9 per cent. of morphia, 1159.
Smuggled into Bombay through Bohra merchants, 24,813.

EMPLOYÉS AND WORKMEN:

Great majority of smokers are not people who do work, but parasites among the workers, 364.
Workmen do not lose their efficiency so long as they do not smoke to excess, 1480.
Sometimes inefficient through opium, but no dismissals, 1595.
Two hundred to 300 men employed, 1622; never had one unfit for work through opium, 1626–28; numbers of them were opium-smokers, 1627; never had to dismiss a servant through opium, 1633.
Chinese servants mostly smoke only once a month, 1738.
Opium-smokers unreliable, 1980, 1999, 2000.
Habit not a bar to employment in India, 3567; in China, v. 151.
Opium-consumers make untrustworthy servants, 9962, 14,968, 14,979.
Not one of the East Indian Railway employés discharged or incapacited through opium during the past 20 years, 19,492, 19,493.
Opium-eaters employed with advantage in malarious places, 19,494.
Great many dismissed for drinking, 19,516.
If opium-eating were distinctly injurious, cases of incapacitation would be found among public officials, 21,812, 21,817.
No case of Government servant being dismissed for over-indulgence in opium, 22,217.
No cases of reduction or dismissal for intemperance in opium, 22,388.
No cases of dismissal on account of opium, 22,800.
Many dismissed on account of alcohol, *ib.*
Have had to dismiss men because of opium habit, 23,457.
Opium-eaters objected to, 23,537, 24,622.
Mill-workers had to give up work in consequence of opium habit, 24,329.
No trouble through opium among 1,400 mill-workers, 25,081.
Opium-eaters much more regular and better workers than alcohol drinkers, 25,134.

EMPLOYÉS AND WORKMEN—*continued.*

Mill-workers more addicted to alcohol than opium, 26,000, 26,010–16.
Musalman weavers in Broach nearly all use opium; certainly very good workers, 26,696.
Opium used by male Hindu and Mussalman weavers in Sholapur, 26,710, 26,734–37.
Half-a-dozen Bombay policemen dismissed in 25 years for inefficiency due to opium, 26,945.
Smart useful servant discharged through opium, 27,004.
Moderate use dose not make a man a bad workman, 27,567.
Opium-users indifferent labourers, 27,645, 27,694.
Contractors do not engage opium-eaters, 27,821.
Liquor drinkers good servants compared with opium consumers, 27,833.
Opium-smoking servants objected to, v. 148.
Known smokers dismissed by Singapore Opium Farm, *ib.*
Effects on efficiency observed in Straits Settlements, v. 150, 154–83 (par. 7); in Hong Kong, v. 184–209 (par. 7); in China, v. 212–343 (par. 7).

ENGLAND:

Use of opium in the Fens, 730, 2491, 2492, 3522, ii. 317, 416, v. 209 (par. 14).
Use of opium in Lancashire, 3387–89, 3430–32.
Use of opium general in malarious district near the Wash, 24,702, 24,709.
Opium consumption near Wisbech, 24,706.
Imports of Malwa opium, 1887–88 to 1890–91, 26,139.
Imports and exports of opium, 1891–92, ii. 449.

EUROPEANS:

A few are habitual consumers, 1050–54.
Paucity due to education and habits, 1059–66.
Not known to use opium, 1425.
Would probably take to opium or hemp if alcohol prohibited in India, 1599*a*, 1600.
Smoking takes up too much time, 1680.
Very few take Native opium, 1688, 1689.
Sometimes as much addicted to opium as Natives, 12,631, 12,632.
One per cent. use opium in the shape of chlorodyne and morphia, 12,652.
Consumers go to greater excess than Natives, 17,313.
Worst cases of abuse of opium met with among Europeans, 19,228, 19,259–62.
Cases of habitual consumption not found, 26,352.
Opinions on habit among Europeans in the Straits and Hong Kong, v. 152, 155–209 (par. 13); in China, v. 212–343 (par. 12).
Associations and procedure connected with opium-smoking distasteful to Europeans, *ib.*

EVIDENCE:

Chairman declines to admit hearsay evidence as to opinions of officials, 1780–89.
"The Poppy Harvest: A Study of Anglo-Indian Ethics," put in, 1870.
Evidence of certain Mahomedans can only be accounted for by saying they must be consumers, 11,017, 11,112, 11,113.
Visiting opium dens an incomplete method of investigation, 14,996–15,000.
Evidence of three witnesses from Jaisalmir State in identical language, 21,128, 21,150, 21,156, 21,176.
Witness, without experience of India, thinks Indian evidence untrue, 27,768–72.
Remarkable evidence to effect that opium is harmless, probably given in interest of liquor traffic, 27,850.
Arrangements for collecting evidence in Rajputana, iv. 384–88.
Abstracts of evidence of witnesses tendered for examination from the Native States in Central India, but not examined by the Royal Commission, iv. 417–24. from Madras, iv. 448–54; from Hyderabad, iv. 505–10; from Central Provinces, iv. 523, 524.
Correspondence regarding the production of evidence by the Government of India, v. 362–76.

*See also* WITNESSES.

EXCISE:

Principles accepted in England should be extended to India, 2534.
Malwa Excise scheme, 2930.

EXCISE—*continued.*

Policy as to issue of licenses, 4875–974, 5005–9, 5038–40, 5043, 5055–57.
Present arrangements satisfactory, 28,135.

*See also* BENGAL SYSTEM, LICENSING, MALWA SYSTEM, *and under the various Provinces and Native States.*

EXCISE OPIUM:

Standard of consistence, i. 134.
Average sales to other provinces, i. 135.
Opium prepared for local consumption in India, ii. 321.
Quantities manufactured and supplied to local governments, 1873–74 to 1892–93, ii. 327.
Receipts from Excise opium, 1873–74 to 1892–93, ii. 328.
Cost price, 1880–81 to 1893–94, ii. 342.
Gain on sale proceeds, 1880–81 to 1893–94, ii. 342.
Outturn at each factory, 1883–84 to 1892–93, ii. 345.
Arrangements on distribution from factory, ii. 346.
Distributed from factory to Government treasuries, *ib.*
Consumption in the Punjab, 1886–87 to 1892–93, v. 105, 106.

EXPENDITURE:

Opium revenue and expenditure, 1880–81 to 1893–94, ii. 342, 343.
Explanation of columns in statement, ii. 344.

*See also* FINANCE, REVENUE.

EXPENDITURE ON OPIUM:

Lower classes spend from 10 to 20 per cent. of income on opium, 3162.
Poor people spend from 10 to 25 per cent., 8605.
Artisans and labourers spend 25 per cent. of their income on opium, 8925–27.
Assamese labourers spend about half their income on opium, 9044–46.
Poor people with large families ruin themselves through opium, 9131, 9159–61.
Daily expenditure on the drug, 9322.
Relation of expenditure to wages, 11,404–11, 11,587.
Labourers and artisans spend about half their income on opium, 12,657.
Proportion of income spent on opium, 13,016–22, 18,192, 18,300, 27,831, 27,873.
Many wealthy men have lost their property through opium habit, 14,513, 14,514.
Forty-five per cent. of the Mahomedan population of Lucknow are insolvent through opium, 14,533–35, 14,578–83.
Poverty is brought on by expenditure on opium, 16,595.
Poor people spend half their income, 16,805–7.
Some consumers spend one-eighth to one-half their income on opium, 25,546, 27,198–200.
Men have ruined themselves through opium, 27,339, 27,352.
Price, in Assam, more than an ordinary cultivator can afford, iii. 227, *Note.*

*See also* SOCIAL EFFECTS.

EXPORTS:

Sales for export to China, 1880–81 to 1891–92, 14, 15.
Export to China chiefly from Bengal, 906.
Average annual exports from India to China, 1821–91, 1862.
Exports of Indian produce and manufactures to Japan, 1885–92, *ib.*
Practically same amount every year, 2077.
Annual average export for the last three years, 26,841.
Average exports to China, i. 133.
Shipments of Behar and Benares chests, 1883–92, ii. 335.
Indian opium exported to foreign countries, 1855–56 to 1893–94, ii. 389–91.
Quantities and prices, 1882–83 to 1891–92, ii. 447.
Bengal and Malwa opium exported to China, 1852–53 to 1861–62, ii. 448.

F.

FALAKSYAR:

Preparation of opium and bhang, 18,957.

FAMINE:

Opium used to allay pangs of hunger, 730.
Enables people to do with less food, 1005.
Idea that opium takes up too much land, and therefore leads to famine, is erroneous, 1057, 10,855.
Great famine in Rajputana caused by want of rain; food could not be sent from other districts through want of means of communication, 1101–6.
Opium greatly reduces death-rate, 4410.
Opium-eaters succumb sooner than others, 10,614, 10,631.
Famine insurance fund, 11,238.
Opium cultivation one of the chief causes of famine, 11,447.
Opium-eaters have more power of endurance than others, 25,101, 25,300.
Habitual opium-eaters in Balasore date practice from Orissa famine, ii. 409, 436.

FARIDKOT:

Consumption of opium, 16,362.
If prohibition introduced throughout India will be enforced, 16,367–69.
Arrangements for import from British territory, 16,371.
Revenue from opium, 16,372–75.
Faridkot State would not ask for any compensation, 16,372.

*See also* NATIVE STATES.

FARMING SYSTEM:

Objections to the system, 2541–52.
No longer obtains in Lower Bengal, 4806.
Punjab system explained, 18,477.
Satisfactory substitute for the minimum guarantee system, 22,670–77.
System offers no temptation to increased consumption, 22,807–13, 22,822–25.
Working of the system in Bombay, ii. 352.

FERAZIS:

Puritanical sect of Mahomedans—abstainers from all kinds of stimulants, 4811–13.

FEVER:

Opium no protection against fever; consumers first to suffer, 298.
Merely a febrifuge on principle that it is sudorific and sedative, 695, 747–50.
Opium consumers less liable that others, 1146; as liable, 4303.
Valuable as a febrifuge, 1153.
Large boat population on Chinese rivers could not live without opium, 1281.
Natives never say that opium prevents fever, 1921.
Value as a protective a popular delusion, 2259, 2285–91, 2295, 2316–19.
Opium is not a protective, 2595, 8642, 8928–30, 19,001.
Native physicians prescribe opium for rheumatic fever, 4542–44, 4575.
Common belief in efficacy as a preventive, 4576.
Opium relieves pain, but does not prevent or shorten the paroxysms, 4710.
Preventive against fever, 6198–200.
Smaller per-centage of opium-eaters take the disease, 7491–94.
Smoking said to keep off fever, 7692, 7716.
Opium taken to relieve pain, 7798; has no effect as a protective, *ib.*
Use as a prophylactic first heard of since appointment of Commission, 8824–32, 8836, 8869, 9132–37, 15,573, 15,868.
Belief in protective qualities of opium does not prevail in Assam, 9048, 9049, 9132, 9187, 9229.
Believed to be a protective, but really is not, 9464, 9491–94.
People of Assam believe it to be an antidote, 9516–18.
Opium-eaters seem to escape, 9626.
Europeans do not take opium as a preventive, 10,110–13, 10,178.
Preventive to some extent, 10,205, 10,244, 10,245, 13,027.
Belief in its efficacy not quite general, 10,315, 10,330–35.
Of use in intermittent fevers, 10,727.
Generally believed to be a protective, 11,686, 11,687.
Not specifically a protective, 11,851.

FEVER—*continued.*

Idea that opium is a protective new, 11,866.
Medical text-books cited as to its value as a prophylactic, 11,923.
Medical opinion of value as a febrifuge, 12,096.
Value as a febrifuge a popular error, 13,116.
Value of narcotine as a febrifuge, 13,484, 13,488–92.
Quinine now gradually superseding it, 13,484.
Opium acts as a tonic, if not preventive, 13,844.
Prophylactic and febrifuge, 13,887–94.
Well-known as a febrifuge, 14,060.
Unheard of as a protective, 16,091, 16,118–30.
Not used in the Punjab as a preventive, 16,449.
Not believed to be a protective, 16,556, 19,066.
Prophylactic doctrine quite new, 16,662–68.
Not generally believed to be a protective, 16,689.
Quinine preferred as a prophylactic, 16,875–81.
Usefulness as a prophylactic doubted, 17,152, 17,171–73.
General opinion distinctly in favour of opium as a febrifuge, 19,101.
Opium not a preventive or remedy, 19,281.
Not recommended as a prophylactic, 19,378.
In highest degree harmful, 19,911.
Not believed to be useful for intermittent fever, 19,989.
Intermittent fever got rid of by opium, 20,698.
Distinctly less frequent and severe among opium-eaters, 21,443, 21,447.
Unheard of either as a prophylactic or remedy, 21,465.
Occasionally prescribed to Natives as a prophylactic, 21,917–19.
Experience in notoriously unhealthy forests prove that opium is a preventive and febrifuge, 22,385, 22,496.
Good as a febrifuge, 22,579.
Use said to be injurious, 23,309.
Not a preventive, but relieves accompanying pain, 23,457.
Prescribed, variously combined, with marked benefit, 24,675.
Opium valuable, with or without, quinine, 24,853.
Produces wonderful effect in combination with other febrifuges, 25,411.
Habitual use checks recurrence, 25,663.
Cuts short the cold stage of intermittent fever; lessens the intensity and duration of second stage, 25,797, 25,862, 25,886.
Sometimes given by vaids in cold stage of fever, 25,826.
Opium-eaters suffer from fever as much as abstainers, 25,839.
Excessive use may interfere with recovery, 25,852.
Never heard of opium as a remedy, 26,498.
Tamils do not regard opium as a preventive, 26,518.
Not known to be used as a protection, 26,586.
Invaluable as an anti-periodic, 26,614.
Consumers seldom suffer from remittent fever, 26,676.
Used with notable results in treatment, 27,135.
Value as a prophylactic only lately heard of, 27,207.
Some say it is a protective, 27,210–14.
Quinine much more effective than opium, 27,800.
Great diversity of opinion among Natives on value of opium, 27,835, 27,858.
Generally believed to be good for fever with chill, 27,835.
Opium a protection against fever, i. 142.
Chinese opium consumers in Hong Kong suffered much less from fever than British troops, i. 145.
Extensive use of opium in Godavery, due to prevalence of fever, i. 145.
Statement that opium merely relieves pain incorrect, iv. 505.
Correspondence regarding narcotine as a febrifuge, v. 76–83.

*See also* MALARIA.

FINANCE:

Financial aspect of the opium question, 94–98, 2936.
Sacrifice of opium revenue would be folly, 872.
Loss of revenue a small part of the question, 888.
Impossible to replace it by further taxation, 894, 909.
Reduction of expenditure impossible, 894, 920.
Opium revenue uncertain, 923–25, 1778.
Most unobjectionable part of Indian revenue, 1561.
India dependent on opium revenue, 2058.
Military expenditure cannot be reduced, 2058–60.

FINANCE—*continued.*

Mr. Gladstone on the financial aspect of the question, 2058, 2445, 2565–67, 2978–80.
Consequences of destroying Indian opium revenue, 2070.
Money insufficient to provide for important works, 2072.
Imperial Exchequer should come to rescue, 2116–18, 2467, 2468, 18,308, 26,899.
Suggested tax on tobacco, 2277, 2383–87, 2602, 3059, 5662; would be highly resented, 2755, 8765, 18,819; income-tax would be even more obnoxious, 5663.
Objections to policy of prohibition, 2561, 2936–39.
Loss through prohibition might be covered by temporary loan, 2565–70.
Difficulty of raising money in India, 2708.
India Government needs revenue, 2767.
Serious loss of revenue through prohibition, 3193.
Suggested substitutes for opium revenue, 5662–66, 10,787, 10,819–21, 11,216, 26,541, 26,848–54.
Impossible to find a substitute for opium revenue, 5765–67, 5793–99, 5809–12, 5815–19.
Loss should be met by curtailment of expenses, 5915.
Curtailment would impair efficiency, 5958–60, 5997–72.
Loss should be made up by duty on foreign liquor, 8624, 24,628.
Loss could be met by retrenchment, 8649, 8650, 13,194, 15,157, 20,049, 20,090.
Tax on tobacco would be much more unpopular than the salt tax, 8765.
Loss should be made up by increase of liquor tax, 11,036–40, 11,071–80, 11,110, 11,111.
Suggested reduction of army expenditure to recoup loss of opium revenue, 11,217–19.
Loss should be recouped by reforms in certain departments, 13,110.
Loss could be met by reduction of military expenditure, and larger employment of Natives in the public service, 16,690.
No substitute for opium-revenue, 17,342.
England would have to give aid for a time until other resources found, 18,308.
Detailed statement of substitutes for opium revenue 18,637.
Effects of prohibition would be very mischievous, 22,164.
Loss could be partly made up by disestablishment of the Church, 23,359.
Prohibition would cause great financial loss to Government, 23,880, 23,913.
Administrative reforms should prevent recourse to fresh taxation, 24,327.
Prohibition would have a serious effect on finances of India, 24,516.
Estimated loss to Government and cultivators, &c. through prohibition, 24,909, 26,701, 26,847.
Effect of prohibition would be disastrous, 25,226, 25,233; would be bankruptcy, 26,153.
Suggested re-imposition of import duties, 26,701.
Army expenditure and home charges cannot be reduced, 26,852, 26,861.
Loss should be made up by England, and by reductions in civil and military expenditure, 26,899.
Indian people powerless to make up the loss as suggested by Anti-Opium Association, 26,925–33.
Loss should be met by reduction of home charges, military expenditure, exchange compensation, &c., 27,285.
Extract from Budget statement, 1862, ii. 448.
No internal sources available to recoup loss through prohibition of opium, ii. 449.

*See also* COMPENSATION, PROHIBITION, REVENUE, TAXATION.

FREE TRADE:

Prohibition of exports from Native States would be inconsistent with British policy, 20,848–51

*See also* POLICY.

FORMOSA:

Effects of the opium habit, 217–19.
Opium usually used with tobacco smoking and drinking, 221, 278.
Indian opium only very rarely consumed, 222.
Opium-shops, and retail sales in Taiwan-foo opium-shops, 228.
Children not allowed to take opium, 274.
Prevalence of habit and effects, v. 320–29.

FORMOSA—*continued.*

Indian opium used by wealthy classes, rest smoke Persian, v. 321–29 (par. 12).
Opium smoking and eating, v. 326–29.

*See also* CHINA.

G.

GALWAN:

Drink made of pounded opium and water, 20,655, 21,128, 21,150, 21,156.

*See also* AMAL PANI, KASUMBHA.

GANJA:

Preparation and effects, 1058.
More habitual consumers than of opium, 1144.
More harmful than opium, *ib.*, 2333, 4003–8.
Not objected to by the Anti-Opium party, 1637.
Breaks the opium habit in many cases, 2364, 2365.
Known cause of running "amok," 3523.
Inmates of asylums, 4714, 4730, 4731.
Much more pernicious than opium; has a distinct effect upon crime; leads to decided increase in insanity, 5472.
Consumers always noisy and quarrelsome, 5506.
Prohibited in Burma, 6570, 6596.
Infinitely worse than opium, 6693.
Consumption by the Shans, 7507–51, 7587; by Burmese troops, 7550.
Evil effects more noticeable than those of opium, 10,782.
More injurious than opium, 22,844.
Comparative effects of opium, ganja, and alcohol, ii. 415.

GHAZIPUR:

Government opium factory, i. 134.

*See also* MANUFACTURE.

GHOLUA:

Opium dissolved in water, v. 124.

*See also* GALWAN.

GHOTEE:

Decoction of opium given to children, 13,416.

*See under* INFANCY.

GIRASIAS:

Habit still prevalent among Girasias, 28,656.
Lazy squireens, who would certainly take to liquor if opium prohibited, 24,566.

*See under* RAJPUTS.

GONDAL:

Cultivation and production of opium, 23,972.
Consumption of opium, 24,075–89.

*See also* NATIVE STATES.

GOOLI:

Opium in form of pills, 2593.
Also called madak, *ib.*
Composition and effects, 4059.
Manufacture and use should be discouraged, 4448–55.

*See* MADAK.

GOOLI-KHOR:

Opium-smoker, a term of reproach, 5840, 5896, 5897, 5914, 8613, 9328, 10,725, 11,224, 11,684, 11,929–31, 18,361.

GOOMTI WATER DRINKERS:

Term of contempt applied to opium drinkers, 15,671.

GUDEM:

Consumption of opium by the Hill tribes, 25,477, 25,490.

GUJARAT:

Prohibition would be regarded with utmost disfavour, 22,696.
Rajput Girasias would be unwilling to bear cost of prohibition, 22,697.

GUJURAT—*continued.*

Consumption of opium by the different races, 24,566, 24,904.
Opium-eating does not appear to affect fine physique of the Gujaratis, 26,775, 26,781.
Early measures regulating consumption, iv. 455.
*See also* BOMBAY.

GURKHAS:

Physical degeneration due to opium observed among Gurkhas in Calcutta, 8805, 8886–99.

GWALIOR:

Rates on opium land reduced largely in 1882–83, 1533.
Consumption exceptional in Gwalior, 21,870, 22,113.
Cultivation and use of opium, 22,167.
Prohibition would entail loss on the State, cultivators, and others, *ib.*
Compensation cannot be estimated, *ib.*
Statistics regarding opium, iv. 408.
Abstracts of evidence of witnesses not examined, iv. 417–19, 423.
*See also* MALWA, NATIVE STATES.

## H.

HABIT:

Practised in India for generations, 1120–23.
Indulgence in both practices—eating and smoking—unusual, 1150.
Abuses mentioned by Native poets, 15,012–15.
Was not introduced by British Government, 19,322.
Opium used for centuries and looked upon as a necessity, 22,176.
Antiquity of the habit, 22,580.
*See also* EATING, POPULAR VIEW, PREVALENCE, SMOKING.

—— REASONS FOR COMMENCING:

Usually grows out of use for disease, 219, 3266, 3279–83, 3746, 3747, 3789, 4240, 5751, 9040, 10,257, 10,362, 10,373, 10,638, 13,111, 13,978, 13,993, 16,861, 17,612, 18,017, 19,391, 19,442, 20,318, 21,878, 22,019, 24,081, 25,378, 25,395, 25,565, 26,023, 26,049, 27,421.
Experience shows that use in disease leads to contraction of habit, 297.
Half the consumers contract habit because of some painful malady, 1030, 1074–79.
Victims of disease find relief through opium smoking and continue the habit, 1457–63, 1476–79, 1489–91.
Some use opium because previously diseased, 1890.
Generally commenced to relieve pain, 2144, 2147, 6684, 21,878, 23,491*a*.
Excess usually in consequence of disease, 3630.
Excessive users always suffering from chronic disease, 3707.
Usually first taken on advice, 3873.
Generally dates from some illness, 4133–37.
People after 40 begin in consequence of some ailment, 4265.
Habit commenced for medicinal purposes, 4501, 4502, 4518.
People usually commence as a medicine, and continue as a stimulant, 5507, 5548–51, 5597–601, 5934–37, 6059.
Usually begun medicinally, 16,328, 17,151, 17,196, 27,828.
Usually commenced to ease pain or mental anxiety, 17,283.
Generally first taken for cough, catarrh, and dysentery, 18,392.
Majority commence for purpose of alleviating disease, 19,544.
Domestic use assigned as a reason, 19,976–78.
Often originates through being taken for fever or bowel complaints, 21,383.
Gradually acquired through use as medicine, 21,443.
Rheumatism often cause of opium eating, 21,986.
Begun through illness or frailty, to meet strain or gratify lust, 23,309, 23,382.
Resorted to by people suffering from chronic pains, 24,913.
Always grows out of use for some ailment, 25,729.
Usually commenced for aches and pains, 26,368.

HABIT, REASONS FOR COMMENCING—*continued.*

Usually begun on account of some bowel or chest complaint, 26,711, 26,775.
Frequently commenced to allay pain of chronic disease, i. 138, 140.
Frequently induced by painful chronic disease, ii. 316.
Ninety per cent. of consumers in Bengal commenced use to alleviate pain, ii. 409, 415.
Contracted by reason of disease; also for luxury iv. 379.
Contracted for pleasure or in consequence of disease, 219.
Majority of Chinese take opium as a dissipation, 1684.
Habit is a fashion, 3789–91.
Smoking habit invariably contracted from bad company, 4264, 4265.
Grows out of use as a restorative, 4284.
Generally resorted to as a means of intoxication, 6327, 6361, 9960, 9979.
Often begun through foolishness, 6719.
Often commenced to take away effects of intoxicating drink, 7232.
Sometimes acquired through use in infancy, 8600, 25,233.
Contracted chiefly for gratification of lower appetites, 9392, 9397.
Resorted to for intoxication, 11,680.
Society of consumers a motive to form the habit, 13,013.
Four chief causes—(i) as substitute for alcohol; (ii) to withstand cold and exposure; (iii) as medicine; (iv) as stimulant, 16,328.
Chiefly acquired through example, 16,546.
Never contracted through use in infancy, 18,819, 26,046.
Forty per cent. of consumers commence using opium as an aphrodisiac, 21,298, 21,365.
Contracted through use at ceremonies, 21,337.
Habit commonly resorted to for aphrodisiacal purposes, *ib.*; 23,309, 23,382, 23,688, 25,395, 27,004.
Usually commenced to administer to lust or relieve pain, 23,491*a*.
Detailed statement of causes of commencement, 24,119.
Often continued from use in infancy, *ib.* 24,140–44.
Very few commence habit as a luxury, 25,395.
Begun for lust with few exceptions, 26,286-304, 26,353–59, 26,436, 26,498.
Contracted in company; not for exciting lust, 26,428.
Frequently begun in company of prostitutes, 26,518.
Usually learned from associates, 26,586
Young men almost without exception take to smoking for aphrodisiacal purposes, 27,004.
Smoking usually commenced for its aphrodisiac powers, 27,186.
Often contracted through bad company or immoral pursuits, 27,597.
Taste for opium often acquired in early childhood, 27,826.
Lecherous persons take opium as a stimulant, 27,828.
Commenced for stimulating effect, ii. 551.
Usually contracted like alcohol habit in England, iv. 505.
Contracted through use as a substitute for alcohol, to withstand cold, for ill-health, especially dysentery, as a stimulant, v. 126.
Reasons alleged for use of drug in Straits Settlements and Hong Kong, v. 153, 155–209 (par. 14); in China, v. 213–343 (par. 13).

HEREDITY:

Habit believed to prejudicially affect consumers' children, 1525.
Evil effects extend to children of consumers, 6361–75, 6393–96, 12,669, 15,198, 15,236.
Effects of indulgence visible to the second generation, 9874, 9905, 9906.
Effects noticeable on offspring, if opium taken for two or three generations, 17,672.
No hereditary tendency to opium, 20,177, 20,285.
No particular liability to disease in children of opium-eaters, 25,400.
Habit has no effect on children of consumers, ii. 411, 415.
Effects not perceptible on consumers' children, iv. 378.

HERSCHELL COMMITTEE:
Report cited, 26,848–50, 26,871.

HINDUS:
Opium used in moderation by all classes, 8763.
Vast majority of Assamese Hindus use opium freely, 9725.
Hindus in Behar smoke madak, 10,977, 10,998.
Twenty per cent. of Hindus consume opium, 12,652.
Twenty-five per cent., 13,411.
Ten per cent. in Lucknow, five per cent. in other districts addicted to the habit, 13,881.
More inclined to opium than Mahomedans, 16,004.
Sixty per cent. of Hindus over forty use opium, 17,248.
Habit exists to a certain extent among Hindus, 17,333.

HISTORY:

Prohibition unjustifiable, and would entail heavy compensation, iv. 502.
Rules for import of opium by railway, iv. 503.
Statement showing supply of opium to each district, *ib.*
Statement showing revenue by opium contracts, iv. 504.
Abstracts of evidence of witnesses not examined, iv. 505–10.

HYDERABAD ASSIGNED DISTRICTS (BERAR):
Arrangements for supply and sale of opium, 27,954–68, 27,977, 28,005, ii. 351.
Prohibition impossible and most undesirable, 27,973.
Closing licensed shops has led to opening of unlicensed smoking places, 28,007–9.
Details as to opium revenue and consumption, 1870–71 to 1892–93, iv. 510.
Consumption of opium by districts, 1892–93, iv. 511.

## I

IDAR:
Consumption of opium, 23,625, 23,788, 24,390.
Arrangements regarding supply, 23,636–53.
*See also* NATIVE STATES.

INCHI:
Burnt refuse of former smokings used in manufacture of chandu, ii. 393.
*See* CHANDU.

INDIAN ASSOCIATION:
Evidence given on behalf of the Association, 5919–21.
Evidence collected with regard to poppy cultivation in Behar, 11,706–85.

INDIAN MEDICAL SERVICE:
Composition, training, and character, 5177–217, 5232–38.

INDIAN NATIONAL CONGRESS:
Question of opium not discussed, 13,258–66.
Views regarding prohibition of alcohol and opium, 14,779–88.
Has done nothing about the opium matter, 15,107.
Did not take up the opium question, 15,580–91, 15,604, 15,605.
Opium question postponed till drink question settled, 16,724.
Opium question has never been before the Congress, 18,632.
Evidence of Berar delegate, 28,031–35.
Did not discuss opium question as Commission was sitting, 28,094.

INDIAN OPIUM:
Stronger than Chinese, but dearer, 587, 582.
A luxury in China, 584–90, 621, 872, 3188, 4214, v. 215–343 (par 16); only used in provinces near the coast, 621.
Contains 2 per cent. of morphia, 1159.
Much superior to China-grown, 2709.
Imports into Newchwang, 18,521, 18,559.

INDIAN OPIUM—*continued.*

Cannot be smoked over again like China-grown, *ib.*
Now only used by Chinese to flavour the home-made drug, *ib.*
Differs from other varieties in chemical composition, ii. 416.

*See also* EXCISE, MALWA, MEDICAL, *and* PROVISION OPIUM.

INDIGO:

Does not compete with poppy crop, 10,809–11, 11,118–20, 11,155.
Rival to poppy, not a substitute, 12,079–82, 12,351, 12,522, 12,523, 12,529–34, 12,734–40, 12,744–46, 12,749, 13,610–13, 19,637.

*See also* SUBSTITUTES FOR POPPY.

INDORE:

Estimated cost of a chest of opium, 22,095.
Neither treaty engagements nor traditional usage would justify British Government in forcing policy on Indore State, 22,201, 22,220–23, 22,334.
Precedents in support of this view, 22,201.
Prohibition cannot be justified on political or moral grounds, *ib.*
Estimate of loss to the State, agriculturists, and traders, 22,202, 22,234, 22,350.
Preventive measures would be impracticable, 22,202.
Prohibition would lead to consumption of liquor, *ib.*; and cause grave discontent, *ib.*, 22,350.
Area under poppy, 22,203, 22,242, 22,334.
No recent change in quantity, 22,223, 22,239–41.
State revenue from opium, 22,203, 22,246, 22,334.
Revenue from indirectly smuggled opium, 22,203, 22,207.
Exports of Native grown and imported opium, 22,203, 22,247, 22,334.
Prohibition would necessitate revised assessment, 22,203.
Estimated amount realisable from crop next best to opium, 22,208.
Estimated cost of measures for suppression of opium, 22,210, 22,215.
Estimated loss to traders and bankers through prohibition, 22,213.
Fullest compensation would be required, 22,214.
No special arrangements in respect of transit through British territory, 22,219, 22,350.
Regular land revenue in force, 22,255.
Rates on irrigated land would have to be reduced if poppy prohibited, 22,258.
Estimated loss, through prohibition, of capital sunk upon opium tanks and wells, 22,209, 22,226, 22,259–65.
Estimated loss to agriculturists and landlords, 22,211, 22,212.
Statistics put in substantially represent facts of the case, 22,355.
Profits of poppy growing, 22,363.
Maize grown in opium land before poppy, *ib.*
Prohibition would be a death-blow to the cultivators, 22,365.
Loss through prohibition to traders and manufacturers, 22,371.
Profits curtailed through recent currency changes in India, 22,372–78.
Abstracts of evidence from witnesses not examined, 22,379, iv. 419–22.
Kharita presented by H.H. the Maharaja Holkar, iv. 102.
Statistics regarding opium, iv. 408.
Return of opium passed the scales, 1878–79 to 1892–93, iv., 415–17.

INFANCY:

Children fed on opium until they are absolutely skeletons, 1926.
Sight of hundreds of Native children utterly destroyed by opium, 1946.
Mothers give children opium to keep them quiet, 2209, 2757, 2797, 3038, 4180–82, 12,582, 12,624, 16,850, 17,151, 17,163, 18,216, 18,795, 19,080, 19,396, 19,976–79, 20,421, 20,990, 20,993, 21,812, 21,870, 21,933–38, 23,309, 23,333, 23,348, 23,682, 23,697, 23,872, 24,075, 24,865, 24,904, 26,711, 26,757, 26,770, 27,427, 27,746, iv. 380.
Danger of administering opium to children, 2299, 2300.

INFANCY—*continued.*

Opium given as a soporific, 2757, 2758, 2796–98.
Opium frequently given to children, 3466–72, 3500–3, 3545.
Large dose injurious, especially to Europeans, 3748, 3749.
Not given to children in Bengal, 3949.
Small doses sometimes given children, 3949–55.
Children up to five or six dosed to keep them quiet, 4268.
Opium most injurious, 4291, 4292.
Burmans opposed to use of opium by children, 7584.
Eating opium by children not common in Assam, 9166–68, 9201–3.
People habituate their young children to use the drug, 10,392.
People sometimes give opium to children to get them to sleep, 11,226, 11,695, 11,703, 17,821, 27,538.
Custom of giving minute doses to children stunts their growth, 11,808–10.
Many children get opium, 12,564.
Very harmful to infants; sometimes leads to imbecility, 12,659.
Supposed to keep children, up to four or five, in health, 12,849.
Seventy-five per cent. of children get opium as medicine, 13,008.
Common practice of dosing infants, 13,112.
Decoction called ghotee given to children for 40 days after birth, 13,416.
Given to Mahomedan children, 13,978.
Commonly given to children up to three or four, 13,993, 13,994, 14,028, 14,029.
Given to infants to prevent chills in the rainy season, 14,187.
Opium a cause of mortality among children, 14,521, 14,626–29, 15,099.
Nearly everybody gives opium to children, 14,813, 20,873–76.
Given to infants during the period of suckling, 15,147.
Opium given to children up to seven or eight, 15,490.
Children given opium from six months to four or five years old, 15,672.
Given to children from a month to six and a half years, 16,069.
Practice common, 16,088, 16,092.
Used for purpose of female infanticide, 16,094–96, 16,146–49, 16,157–59, 16,164, 16,169–72.
Children's lives lost and constitutions affected by opium, 16,096, 16,135, 16,142–45, 16,150–52, 16,166.
Universal practice to give opium to children until two and a half to three years old, 16,163.
Mothers give opium to children, 16,219, 16,483, 16,500, 17,000.
Keeps children in good health and makes them sleep 16,523.
Generally administered to infants of all classes, especially labouring, to keep them quiet, 16,683.
Occasionally results in fatal accidents, 16,853, 16,858.
Commonly given to children; is pernicious, 16,902.
Formerly much used for infanticide, *ib.*
Given to children from one and a half to four years, 16,986.
Deleterious effects upon children, 17,300–8.
Generally given in small doses as a medicine, 17,499–508, 17,511.
Occasionally leads to accidental poisoning, 17,505, 18,795.
Sometimes given to infants, especially by women of bad character, 17,624.
Three or four cases of children affected by opium in a year, 17,761.
Practice of dosing children not general in Lahore, 17,662–65.
Practice far more prevalent at Lucknow, 17,784–86.
Useful for sucking infants, 17,883.
Given to noisy children to quiet them; has proved fatal, 17,952.
Girls more generally drugged than boys, 18,210.
Coolies almost without exception give opium to their children to keep them quiet, 18,349.
Forty per cent. of mothers give opium to infants, 18,433.
Opium given to children from one month to two or three years, 18,819.
Bad effects not so noticeable when they get sufficient milk, *ib.*, 18,829–37.
Cases of overdose; sometimes fatal, 18,820–25.

INFANCY—*continued.*

Given to babies and children to procure sound sleep, and as a preventive of *nazla* or cold, 18,868, 18,903, 18,916, 18,957.
Children often killed by overdose, 19,080.
Mothers give opium to infants under a year to keep them quiet; to constipate them, and so save trouble, 19,596.
Children suffering from cold or diarrhœa are given opium, 19,725, 20,907.
Custom very injurious, 19,733.
Given to infants and babies to make them sleep, 19,757, 19,797.
Women of all castes give opium to their infants, 19,885, 19,887, 19,890.
Produces emaciation, 19,980–84.
Small doses given to children when teething, 20,169, 20,907.
Parents occasionally continue to give it to children from carelessness or for disease, 20,278.
Children given opium from third month to second to fourth year to keep them quiet or prevent infantile disorders, 20,285.
Habit justifiable in a country where pure milk difficult to procure, *ib.*
Children show no special desire in after life to resort to opium, *ib.*
Opium given to children to ward off infantile complaints, 20,421.
Administered to children up to two or two and-a-half years, 20,982.
Given to stop diarrhœa, 20,990, 20,993.
Practice of dosing with opium does not appear to interfere with growth, 21,047–53.
Seventy-five per cent. of infants daily dosed with opium, 21,073, 21,082, 21,116.
Injurious effects of opium dosing, 21,298.
Great deal of wasting accompanies practice, 21,318–26.
Deaths frequently occur through accidental overdose, 21,506, 21,543.
Given to children below three as a rule; keeps them in health, and lightens small-pox, 21,577, 21,590, 21,655.
Eighty or ninety per cent. of infants in Malwa get opium soon after birth, 21,883.
Believed to keep the children contented; prevents bronchitis, diarrhœa, and other disorders, *ib.*
Practice seems to exercise no injurious effects, *ib.*, 21,887–89.
All classes in Bhopal, except Bohras, give opium to their children, 21,948, 21,988, 22,034–38.
Excessive quantities given when mothers cannot nourish them, 21,949, 21,974.
Occasionally produces marasmus, 21,950–58.
Given to babies for croup, indigestion of milk, and infantile disorders, 22,167, 22,178.
Popular idea in Malwa that children would die without opium, 22,176, 22,177; some truth in the idea, 22,176.
Enables children to sleep well and digest food; prevents disease, 22,385, 22,413.
Given to weak, emaciated, cranky children, 22,496.
Without opium, 40 per cent. would die, *ib.*
Practice not disapproved of, 22,557.
Mode of administration to children, 22,577.
Stopped on weaning, *ib.*
Given to children up to age of three or four, 22,936, 22,969.
Preserves them from fever, diarrhœa, and other ailments, 22,969.
Given to children up to three years with great advantage, 23,046, 23,062, 23,104.
Given to infants for cold, 23,261, 23,267–80, 23,294.
Given to children up to two or three to keep them quiet, 23,309, 23,333, 23,348.
Vital functions interfered with by use of opium, 23,390, 23,394–421, 23,429, 23,451, 23,457.
Severe form of diarrhœa due to opium, 23,491*a*.
Bronchitis and pneumonia often seriously complicated by opium, *ib.*, 23,501.
Opium mixed with other drugs, given to children to keep them quiet, 23,682, 23,697.
Checks secretions and leads to occasional accidents, 23,698–701.
Small pills given children for health; among poorer classes to quiet them, 23,872.
Opium dosing procures sleep and preserves health, 23,886.
Infants dosed with opium to keep them quiet; habit dangerous, 24,075.

INFANCY—*continued.*

Practice of giving opium to infants, 24,119.
Practice of dosing infants very common, 24,671.
Considered to be beneficial during teething, but probably given to quiet them, *ib.*, 24,695–97.
Effects on well-nourished children not noticeable, 24,674.
Cases of injury by ordinary dose unknown, 24,758–60.
Practice of dosing infants not common among the Parsis, 24,762–66.
Eighty per cent. of children in Bombay get opium, 24,852, 24,883–85.
Practice not so common as 20 years ago, 24,864.
Opium given to children to help them to digest milk, also to keep them quiet, 24,865.
Given to children during teething, to prevent sleeplessness and indigestion, and to keep them quiet, 24,904.
Given to infants to procure sleep; injudicious use ruinous, 25,397, 25,398.
Given to young children as a protection against cold, fever, &c., 25,552.
Opium checks infantile diseases, 25,658.
Opium given children to procure sleep and diminish irritation of teething, 25,799, 25,822.
Accidents sometimes occur, but practice does good, 25,801–7.
Practice less common among Parsis than 20 years ago, 25,819.
Bad effects visible on ill-nourished children, 25,822.
Minute doses given to children, 25,865, 25,894, 25,905.
Practice does not appear harmful to well-nourished children, 25,867, 25,894.
Decidedly beneficial in cases of diarrhœa, flatulence, &c., 25,867, 25,905.
Attention to hygiene preferable, 25,894.
Used as a soporific by all classes, 25,953, 26,050, 26,055.
Sixty per cent. of Hindu and Musalman children given opium, 26,038.
Practice of dosing infants does not lead to habit in after-life, 26,046.
Practice has led to accidental loss of life, 26,053.
Ninety per cent. of children in Poona habitually drugged, 26,055.
Practice very injurious, 26,058.
Practice of dosing infants occasionally leads to habitual use, 25,233.
Safely administered to children of two months, 25,254.
Deaths occur from injudicious use, 25,283.
Given regularly up to three years in teething and bowel troubles, 25,339.
No specific harm perceptible, 25,362.
Many cases of accidental poisoning from opium, 26,370.
Practice of dosing infants very common, 26,373.
Bad effects not noticed, 26,374.
Practice of dosing infants all but universal, 26,437, 26,498, 27,393.
Many vicious traits in older persons due to the practice, 26,437.
Evil effect on children, *ib.*, 26,498, 26,518.
Excessive doses cause emaciation, bowel disorders, and loss of sight, 26,619–25.
Medical opinion on the practice divided, 26,632–34.
Occasional cases of accidental overdose, 26,641.
Evil results indirectly ascribable to opium, 26,643.
Incautious use brings on marasmus from imperfect assimilation of food, 26,644.
Opium found in almost every household where there are young children, 26,650.
Commonly given to small children with advantage, 26,674.
Given to children during teething, to prevent disease, and quiet them, 26,711, 26,757, 26,770.
No baneful effect as a rule, *ib.*
Fatal cases mostly due to accident, 26,723–26.
Excessive dose causes indigestion and diarrhœa, but never ulceration of the cornea, 26,729.
Soothes pains of teething, whooping cough, and measles, and prevents convulsions, 26,775.
Opium usually given without medical prescription, 26,796.
Practice proves useful to Native children, 26,809–12.
System of giving balagoli to children considered wrong, 26,897.
Used for lung and bowel troubles accompanying dentition, 27,135.

INFANCY—*continued.*

Poorer classes give it to keep children quiet, richer classes as a matter of custom, 27,427.
Practice of dosing infants very injurious, 27,645–63.
Eighty or ninety per cent. get opium, 27,650–57.
Given as a tonic, also to keep them quiet, 27,746.
Given to children to procure sleep and prevent infantile disorders, 28,026.
Given to all children up to three or four, 28,064.
Not given after that age unless medically prescribed *ib.*
Does not appear to produce any bad effect, *ib.*
Practice of dosing infants very common, 28,072–76.
Practice not attended with evil results, 28,098.
Opium a blessing to infants, 28,116.
Given to children up to three to prevent colds, 28,124.
Practice of giving opium to keep children quiet is harmful, 28,143–46.
Large per-centage of mortality due to opium, ii. 315.
Rajputs and others give pilules to infants up to four years, ii. 414.
Given for disease, also to quiet them, iv. 380.
Administration of opium to children, iv. 382.
List of children examined, iv. 382–84.
Habitual use recommended for European children during dentition, iv. 506.
Practice of dosing infants almost universal, v. 124.
No bad effect on health visible, *ib.*

INQUISITORIAL MEASURES:

Consumption would be decreased under an inquisitorial system, 8410.
Prohibition is possible if sufficient informers paid by Government, 10,038.
Prohibition would lead to most vexatious and iniquitous measures, 10,206.
Prohibition could only be effected under a system of irritating espionage, 10,841, 10,846, 10,848, 10,854.
Prohibition would entail oppressive inquisitorial measures, 14,798.
Oppression would necessarily follow prohibition, 16,024, 16,040.
Prohibition would lead to false accusation and extortion, 17,233, 17,341.
Prohibition would be a terrible harassment to the people, 18,150.
Prohibition would entail vexatious espionage and petty tyranny, 19,530, 20,778, 20,779.
Preventive measures for restriction of growth and sale would be needlessly inquisitorial, 22,217.
Preventive measures would cause needless annoyance, 25,569.
Prohibition would necessitate a system of espionage, 27,472.
Preventive measures would involve searching persons and goods of travellers, and houses of the people, i. 143.
Suppression of smoking in licensed houses likely to lead to harassing prosecutions, ii. 395.

*See also* PROHIBITION.

INSANITY:

Effects of ganja and opium compared, 1058.
Eight cases out of 2,202 admissions, from opium in 10 years, 1143.
Very few cases due to opium, 3486–88.
Traceable to gooli smoking, not to eating, 3973.
Habit does not lead to lunacy, 4047, 4205.
Ganja smokers and opium-eaters, 4714, 4730, 4731
Sudden stoppage of the habit has led to insanity, 6986.
Opium not so often cause as bhang, 7357.
Opium rarely leads to insanity, 11,889.
Insane opium consumers also generally addicted to ganja and other intoxicants, 12,571.
Opium not a prominent cause, 13,886.
Opium-eating seldom causes insanity, 14,226.
Is a great preventive in India, 14,230, 14,260, 14,261.
Occasionally ascribed to abuse of opium on insufficient grounds, 19,235.
Never follows use or even abuse of opium, 20,285.
Cannot be traced to opium habit, 22,579.
Never known to be due to opium alone, 24,718, 24,774, 24,786–95.
Opium rarely or never causes insanity, 25,368.
Opium does not produce delirium or insanity, 25,797.
Excessive smoking sometimes causes insanity, 25,510, 25,552.

INSANITY—*continued.*

Cases through opium not known, 27,429.
No evidence that opium is comparable with alcohol as a cause of insanity, ii. 410, 417, 437.
Opium-eaters in lunatic asylums, 1881–90, ii. 421, 422.
Opium does not cause insanity, iv. 379.

INSURANCE:

Societies do not impose a higher rate on opium-eaters, 1048–57.
Proposals accepted from moderate opium-eaters, 3612–17.
Moderate opium-eaters passed at higher premium, 5834.
Premium not increased for opium consumers, 14,268–71.
No deaths from opium-eating in 20 years, 24,682.
Effect of habit on value of lives, 24,943–68.
Careful in accepting lives; some years should be added to moderate users, 25,730–32, 25,747.
Evidence given by Oriental Insurance Company doubted, 26,493–96.
Statement that Oriental Insurance Company contested a claim because deceased took opium is entirely misleading, 27,069.
Real contention was that policies were obtained through fraud, *ib.*
Statistics of policies on the registers, *ib.*, 27,084.

INTOXICANT:

*See under* STIMULANT.

## J.

JADWAR:

Opium compound prescribed by Native hakims, v. 124.

JAISALMIR:

Loss to the State through prohibition, 21,128.
Consumption of opium, *ib.*, 21,150, 21,156.
Import duty, 21,128, 21,130–33, 21,158–60.
Poppy not grown in the State, 21,129.
Profits of the opium trade, 21,156.
Sale of opium free, 21,161.
Consumption of opium, iv. 399.
Estimated loss of revenue and profit if prohibited, *ib.*

*See also* NATIVE STATES.

JAMNAGAR:

Consumption of opium, 23,555, 23,580, 23,594.
People would object to prohibition, 23,559.
Would think it tyranny if extra taxation imposed, 23,561, 23,584, 23,597.
Compensation in cash not wanted, 23,567.
Estimated loss to State through prohibition, 23,568.

*See also* NATIVE STATES.

JAORA:

Statement from H.H. the Nawab, 23,183.
Fifty per cent. of population addicted to opium, 23,184.
Estimated loss to the State through prohibition, 23,185, iv. 407.
Estimated loss to cultivators and traders, *ib.*
Exports of manufactured and crude opium, 23,189–92.
Rates on opium land higher than other, 23,193–202.
Statistics regarding opium, iv. 408.
Return of opium passed the scales, 1878–79 to 1892–93, iv. 415–17.

*See also* NATIVE STATES.

JAPAN:

Opium prohibited, 202, 1717.
Consumption of alcohol, 203, 1717.
Imports of British and Indian manufactures contrast favourably with Chinese, 1758, 1765–69, 1840–48.
Statistics of British exports, 1860–91, 1862.
Exports of Indian produce and manufactures, 1885–92, *ib.*
Opium-smoking unknown, 2033.
Japanese inferior to Chinese in character and physique, 2034.

JAISDAN:
Consumption of opium by the different races, 24,361.
*See also* NATIVE STATES.

JATS:
Habit common among the martial races, 13,863, 13,864, 13,876.
Soldiers appear to benefit by opium, 14,151–56.
Native soldiers take opium habitually, 14,181, 14,192.
Malwai-Jat-Sikhs—finest race in the Punjab, and most addicted to opium, 15,738–43, 18,795.
Some classes not addicted to opium, 16,232, 16,233.
Opium-eating prevalent, 16,683, 16,726, 16,765.
Proportion of opium consumers among the Malwa Jats, 18,455.
Some of the finest regiments recruited from them, *ib.*
Do not take opium as a rule before forty, *ib.*
*See also* NATIVE SOLDIERS.

JAVA:
Consumption of opium, 5369, 5375.
Indian opium imported, 1866–67 to 1871–72, 1891–92 to 1893–94, ii. 335, 391.
Opium supplied to the farmers, 1890–92, v. 344.

JEYPORE:
Poppy cultivation; comparison of poppy with other crops, 20,182.
Loss to cultivators through prohibition, 20,183, 20,188.
Loss of revenue, 20,184. 20,198–203.
Loss to opium traders, 20,190.
Total direct annual loss, 20,191.
Advantages of the poppy crop, 20,193.
Fear of false charges of smuggling deters cultivators, 20,194, 20,256.
Landholders discourage poppy, rent not being paid in kind, 20,194, 20,257.
Poppy requires less water than other irrigated crops, 20,260.
Poppy not grown every year, 20,222.
No other crop grown with it, 20,223.
Cultivator free to sell produce to anybody, 20,229.
Effect of prohibition on agriculture, 20,323.
Raj rent on first and second class poppy land, 20,182, 20,195.
Paid in cash for poppy, sugar cane, and cotton, 20,196, 20,258, 20,323.
Paid in kind for cereal crops, 20,197, 20,258, 20,323.
Rent fixed at a cash rate every year, 20,258.
Effect of prohibition on rents, 20,323.
Duty paid at Indore or Ajmere, 20,205.
Import duty, 20,198–202.
Transit duty lighter than import, 20,201.
Retail price, 20,228.
License for export necessary from British Government, 20,231–36.
Post used by the lower classes, amal pani by the higher, 20,212–14, 20,265.
Ten per cent habitual, and thirty per cent. occassional consumers among the agricultural classes, 20,215.
Habit fairly common among the trading class, 20,219.
Public smoking shops prohibited, 20,239.
Prevalence of the opium habit, iv. 377.
Statistics of poppy cultivation and opium consumption, iv. 397.
Estimated loss to the State, &c., if cultivation prohibited, *ib.*
*See also* NATIVE STATES.

JHALLAWAR:
Receipts from opium, poppy seeds, &c., during last five years, 20,627–31.
Details of poppy cultivation, 20,635–37.
No satisfactory substitute for opium, *ib.*
Rents and revenue would be reduced if poppy prohibited, 20,649.
Quite an exception to find anyone who does not take opium, *ib.*
Galwan is used on occasions of rejoicing, *ib.*
Details of value of opium trade, 20,658–77.
Seventy-five per cent of the men are regular consumers, 20,673.
Opium sent to scales at Ujain and Indore, 20,674.
Statistics of poppy cultivation, iv. 394.
Estimated loss to the State, &c., if prohibited, *ib.*
*See also* NATIVE STATES.

JIND:
Transit regulated by Indian Government, 16,266.
Revenue from opium, 16,267.
Estimated loss through prohibition, *ib.*
Consumption of opium, 16,272.
*See also* NATIVE STATES.

Consumption of opium, 24,852, 24,854.

KISHENGARH:

Cultivation and use of opium, 21,577, 21,590.
Loss to the State and individuals through prohibition, 21,593–609.
Compensation would not induce State to prohibit poppy, 21,620.
Statistics of poppy cultivation and opium consumption, iv. 396.
Estimated loss to the State, &c., if cultivation prohibited, *ib.*

*See also* NATIVE STATES.

KOLIS:

Inferior Girasias; much addicted to opium, 22,802, 22,828.
Addicted to robbery; are opium-eaters and liquor drinkers, 22,870–74.
Habit leads to thefts, &c., to procure opium, 23,609.
Drink liquor as well as eat opium, 23,632.
Use opium considerably; consumption diminishing, 24,566.

KOTAH:

Area under poppy during last five years, 20,680.
No crop that can compare with opium, *ib.*, 20,711.
Rates for opium-fields higher than for other crops, 20,680–83.
Suggested substitutes for opium crop, 20,680, 20,695, 20,711, 20,714.
Prohibition would necessitate revision of irrigated rates, 20,685,
Loss to the Durbar through prohibition of production and export, 20,687–92.
No excise upon opium or preparations, 20,694.
Calculations showing profit of opium compared with other crops, 20,695, 20,700–7, 20,714.
Prohibition would entail loss of credit, 20,697, 20,715.
Opium seems suited to the climate, 20,718, 20,761.
Prohibition would entail great loss on merchants, 20,727, 20,751.
All the poorer classes would be affected, and cultivators ruined, 20,734.
Statistics of poppy cultivation and opium consumption, iv. 394.
Estimated loss to the State if cultivation prohibited, iv. 395.

*See also* NATIVE STATES

KUMBIS:

Cultivating class; do not use opium, 22,051.

KUNBÔN:

Betal leaf cooked with opium; prohibited in Burma, ii. 463.
Sold in opium dens, ii. 608.

## L.

LABUAN:

Interference with importation and sale of opium not politic, 1637.

LAKHTAR:

Consumption of opium, 24,551.
Price before and after 1878, 24,556.
Arrangements regarding opium, 24,560.

*See also* NATIVE STATES.

LAW:

Opium Acts, 1857 and 1878, ii. 527–36, iv. 458–69.
Acts to amend the law relating to opium, 1876, 1877, iv. 456.

LEPERS:

Opium gives relief, and is a good thing, 1481, 1490.
Habit gives great alleviation of sufferings, 22,579.

LICENSING:

Licensing in Bengal, 2069.
Existing system does not appear to restrict consumption, 2265–69.
Inefficiency of restrictions, 2425–36.
Vices of the system in India, 2538–40.
Punjab system of licensing cultivation, 2560.
Existing system hoplessly vicious, 2598–600, 2691–96.
Compared with Gothenburg system, 2932.
Licenses too freely given in Assam, 3054, 3055, 3114–17.
Government ought not to license sale of madat and chandu, 3980.
Existing system the best, 4156, 4157.
Licenses for smoking on the premises should be abolished, 4452, 4453, 4577, 4585–87.
Existing system not bad, 4509.
Licenses for sale of madak and chandu in Lower Bengal, 4800, 4816–55, 4875–974.
Sale of Excise opium under licenses, 4806.

LICENSING—*continued.*
System in Bengal has worked very well, 4806–8.
Issue by auction has increased revenue, 4807.
Policy of Excise Department, 4875–974.
Licenses for smoking madak and chandu, 5005–9.
Not regarded from revenue point of view only, 5040, 5055–57.
Chandu and madak shops, 5041–45, 5051–54.
Actual fee fixed by auction, 5061–68.
Number fixed by the authorities, 5111–17.
Number of smoking shops in Bengal, 1885–90, 5461, 5480.
Existing method tends to spread of the habit, 5841, 8615, 8643, 10,619, 10,648, 13,387, 14,004, 15,514–16, 16,562, 18,257.
Regulations are very beneficial, 6193.
Abolition of licensed shops would increase consumption, 6063, 6089–93.
Licenses sold by auction, 14,819–21.
Government rules very strict and discourage cultivation, 17,697, 17,698.
Present system rather inducive than prohibitive, 18,199.
Best system yet tried, 19,532.
Facility with which opium can be procured—evil of the present system, 19,733.
Given too freely at present, 19,885.
Sale of licenses by auction wrong in principle, 22,822.
Issue of licenses for poppy cultivation, ii. 320.
License fees, 1880–81 to 1893–94, ii. 342.
System of granting licenses for non-medical and medical use, ii. 347–54.
Receipts from license fees, 1883–84 to 1892–93, ii. 348–54.
System in force in Bengal, ii. 427.
Chief features of the auction system, *ib.*
Madak and chandu licenses, *ib.*
Revenue from license fees in Bengal, 1873–74 to 1892–93, ii. 428, 429.

—— FORMS:
Form of license to cultivate poppy in the Benares Agency, ii. 330.
Assamiwar license to cultivate poppy in the Behar Agency, *ib.*
Joint license to cultivate poppy in the Behar Agency, *ib.*
License for retail sale of opium, ii. 430.
License for manufacture and retail sale of madak (or chandu), ii. 431.
License for retail sale of poppy heads, ii. 432.
Druggist's permit, ii. 433.
*See also* EXCISE, *and under the various Provinces and Native States.*

LIMRI STATE:
Consumption of opium by the different races, 24,646.
*See also* NATIVE STATES.

LIQUOR TRAFFIC:
Systems in force in the Native States, 20,507–9, 20,574, 21,093–97, 21,143, 21,192, 23,570–76, 23,633, 23,643, 23,668, 24,287, 24,295–97, 24,396–400, 24,415, 24,421, 24,458, 24,503, 24,507, 24,525–31, 24,561, 24,633.
Existing restrictive measures sufficient, 26,245–49, 26,265–69, 26,279–83.
Arrangements in Hyderabad, 27,910, 27,911.

LOCAL OPTION:
Local opinion consulted before new opium shop opened, 8314–17.
System should be adapted to meet popular opinion in the different districts, 8626.
Public opinion consulted as to opening new shops in Assam, 8996.
Should be applied to the opium question, 15,601–3.
Possible in some parts of India, 17,264.
Would be a new departure from the old established policy, 18,621.
Government policy in N.W. Provinces is to open smoking shops only where there is a distinct existing demand, 19,120, 19,130.
Liquor traffic should be abolished by local option, 26,540.
Recommended in case of sale of alcohol, 27,023.

LONGEVITY:
Opium smokers may live as long as anybody else, but are the first to die in famine or epidemics, 365, 405–8.
Moderate use does not shorten life, 1020, i. 141.
Habitual use does not shorten life, 1637.
No perceptible effect on longevity, 11,829, 11,878.
Excessive habitual use very injurious; shortens life, 18,959, 23,791, 24,075, 24,085.
Over indulgence does not tend to shorten life, 22,028.
Effects of habit on longevity, 22,579, iv. 379.
Habitual consumption shortens life, 23,791.
Intemperate use shortens life, 24,075, 24,085.
Does not shorten life or weaken intellect, 24,566.
Opium does not appear to shorten life, 25,403, 25,992, 26,025, 26,043.
Excessive use does not shorten life, 26,770.
Madat smoking tends to shorten life very much, ii. 415.

LOHARU:
Opium habit not general, 18,720.
Consumers would certainly resent interference with its use, 18,723.
*See also* NATIVE STATES.

LUCKNOW:
Consumption of opium at Lucknow, 13,682, 13,683.
Licensed shops well conducted at Lucknow, 13,688.
Extent of poppy cultivation in the district, 13,693.
Excessive consumption of opium due to number of of disreputable people, 14,843, 14,844.
Habit has ruined thousands of families, 15,006, 15,036.
Prevalence of habit attributable to immorality during Nawabi régime, 16,842, 16,867, 16,868.
Visit to the opium shops, v. 99, 100.

## M.

MADAK:
Mixture of inferior opium and bran, 1058.
Solid form of opium, 2148.
Preparation of opium for smoking, 2593, 2707, 11,858–61, 11,896, 11,921, 11,929, 12,851, 15,139–46.
Manufacture should be abolished, 3529, 3538–44, 3579–84.
Shops should not be closed, if result would be to drive consumers to alcohol, 3768.
Public sale should be stopped, 4607.
Number of licenses in Lower Bengal, 4800, 4816–55, 5041–45, 5051–54; has been reduced, 4925.
Preparation and price, 4814, 4815.
Unlicensed manufacture should be prohibited, 4922, 4923.
Smoking not always a vice, 5031.
Madak smoking considered more disgraceful than eating, 9239.
Prepared differently in Assam and Bengal, 9970.
Shops should be closed except where there is a Chinese population, 10,790.
Analysis, 13,483.
Very little used, 13,690.
Can only be sold at Lucknow by licensed vendors, 13,740, 13,767–77.
Manufacture for domestic use requires special license in Bengal, 13,779, 13,822; permitted in Lucknow, 13,778–82.
Sale by license discontinued in the Punjab, 15,713.
Smoked now; 20 years ago Punjabis did not know how to prepare it, 18,210.
Preparation should be made a penal offence, 18,260.
Not much used in the Punjab, 18,756.
Sale prohibited in Dholpur State, 21,655, 21,664, 21,688–97.
Preparation and use, 25,288–94, 25,304–6, 26,060, 27,389–93, 27,641–44, iv. 521, v. 87.
Sale to women and children should be penal, 25,293.
Milder than chandu smoking, 25,662.
Cheaper and worse than chandu, 25,943–47.
Number of licensed shops in Bombay, 1883–4 to 1892–93, 26,144.
Manufacture for sale without license a penal offence, 27,289, 27,410–15.
Restrictions, short of prohibition, should be enforced, 27,397.

MADAK—*continued.*

Chiefly used by lower classes of sweepers and Mahomedans, 27,578, 27,615.
Sale and use should be entirely prohibited, 27,597.
Generally recognised to be very harmful, 28,253, 28,268.
No desire to sleep after smoking, i. 141.
Number of licensed shops in Bengal, Assam, and N.W. Provinces, 1883–84 to 1892–93, ii. 348, 349.
Much worse than chandu smoking, ii. 413.
System of licensing and sale in Bengal, ii. 427.
Number of licenses in force in Bengal, 1873–74 to 1892–93, ii. 428.
Revenue from license fees, ii. 429.
Licenses and fees in Assam, 1873–74 to 1892–93, ii. 455.

—— REVENUE:

Gross receipts of Excise opium revenue, 1883–84 to 1892–93, iv. 442.
Statement showing revenue from opium, &c., 1880–81 to 1892–93, iv. 443–44.

MADRAS—*continued.*

—— SALE:

Arrangements for supply and sale of opium, ii. 351.
Number of shops, consumption, receipts from license fees and pass duty, 1883–84, to 1892–93, *ib.*
System of licensing wholesale and retail sale, iv. 434.
Number of licenses issued, 1880–81 to 1892–93, iv. 435.
Statement showing number of shops for sale of opium, intoxicating drugs, and poppy heads, 1880–81 to 1892–93, iv. 436–38.

—— TRANSPORT:

Rules for issues of passes, iv. 435.

MADRASIS:

Excessive use of opium almost unknown, 6743.

MAHAJANA SABHA (CONJEVERAM):

Resolutions passed, and statistics collected, by the Society, 27,878–83.

MAHI KANTHA:

Consumption of opium, 24,012, 26,000.
Impossible to extend prohibition to the States as they contain many consumers and others who use opium according to ancient customs, 24,256, 24,260.
Consumption of opium by the different races, 2,4256, 24,405.
Prohibition would cause a heavy deficit, 24,259.
Arrangements regarding opium, ii. 356.
Quantity imported for home consumption, 1891–92, *ib.*
Text of agreements now in force, ii. 362, 363.

*See also* NATIVE STATES.

MAHOMEDANS:

Opium-eating prevalent, 2591.
Men and women use opium as an aphrodisiac, 2593.
More given to opium than Hindus, 2803, 2821–26, 2884–87.
Decay not peculiar to Murshidabad, 3196.
Generally take opium as a habit, 6262.
Use more than the Hindus, 7431–34, 10,969–72, 12,681, 13,860, 19,675.
Opium-eating not a common practice, 8405, 8476; used as a stimulant for generations, 8405, 8451–55, 8460.
Mahomedans in Eastern Bengal use opium as a medicine, 8558, 8559.
Not so many as 90 per cent. use opium, 8562, 8569, 8575.
Opium used in moderation by all classes, 8763.
Take opium openly as medicine, 8779, 8780
A few smoke chandu, 10,977.
Mussalmans form the majority of consumers, 11,680.
Habit prevails amongst the rich and their followers, 11,806.
Seventy-five per cent. consume opium, 12,652, 13,087, 13,100, 13,411.
Smoking most common among low Mahomedans, 13,793, 13,827, 16,683, 16,766.
Habit common among the martial races, 13,863, 13,876.
Fifty per cent. in Lucknow, 20 per cent. in other districts, 13,881, 13,904, 13,932.
More addicted to habit than other people, 13,937, 14,456.
Habit very common; women and even children use opium, 13,978.
Sometimes smoke chandu or madak, 14,225.
Mahomedans of Lucknow notorious for opium habit, 14,422, 14,423.
Fifty per cent. consume opium; of these 25 per cent. smoke, 14,510, 14,511.
Take less opium than Sikhs and Hindus, 17,151, 17,183, 17,184, 17,333.
Twenty per cent. of the Punjab Mahomedans use opium, 17,249.
Practically no consumers in Shahpur district, 17,374.
Hardly any Mahomedan cultivators take opium, 18,406.
Dwellers in the lowlands take opium, 18,457.
Habit most prevalent at Benares and Agra, 19,434, 19,456.
Prevalence of opium habit ascribed to prohibition of liquor, 19,527.
Would take to bhang if opium prohibited, 22,819.
Use of opium prevalent, 22,828.
Scores of Maulvis take opium, 24,983, 24,996.

MAHOMEDANS—*continued.*
Habit common among artisans, 24,991.
Orthodox Mahomedans take opium in moderation, 25,240.
Three-fourths of Mahomedan adult males consume opium, 25,410.
Eight or 10 per cent. eat opium, 25,858.
Form 90 per cent. of smokers in Bombay, 27,004.
Opium smoking and eating are most prevalent, 27,179, 27,184.
Madak smoking prevalent in the Seoni district, 27,388, 27,419.
Generally confined to lower order, 27,492, 27,578.
Opium smokers mostly Mahomedans, 28,105.
Would have just cause of complaint if their only stimulant prohibited, ii. 317, 318.
From 5 to 30 per cent. indulge in opium, ii. 411.

MAHRATTAS:
Not addicted to opium as a rule, 1555.

MAIZE:
Generally grown with poppy in same year, 5258, 5311–13, 23,167–69, 23,181.
Commonly grown with poppy, 10,796, 11,163.
Commonly precedes the poppy crop, 19,472.
No other crop but poppy could follow maize, 23,170.
Generally grown with poppy in Malwa, 23,196–240.
Statement showing initial value and cost of produce of an acre of Makka land, iv. 400.
*See also* CULTIVATION, SUBSTITUTES FOR POPPY.

MAJUM:
Preparation of opium used as an aphrodisiac, 18,957.
Composed of bhang, sweets, opium, and sometimes stramonium seeds, 18,992–94.
Confection of ganja and poppy seeds, 25,319.

MALABAR:
Consumption of opium, 25,564.
*See also* BOMBAY.

MALACCA:
Prevalence of opium smoking, 169.
Consumption of opium, v. 181, 182.

MALARIA:
Opium not known as a prophylactic in Formosa, China, or Burma, 228.
Valuable in relieving pains of rheumatic fever, 298.
Gives relief from pain accompanying malarial rheumatism and dysentery, 695.
Never asked for opium in malarial districts, 698.
Not a prophylactic; very little used as a cure in China, 847.
Smokers less likely to recover than others, 848.
In some degree a prophylactic, 1005.
Malarial fevers would be considerably increased in severity if opium unattainable, 1007.
Undoubtedly valuable as remedy and prophylactic, 1146.
Valuable as a prophylactic in the malarial deltas of great rivers, 1153.
Used as a prophylactic in the Mid. and S. provinces of China, 1281.
Natives thoroughly believe in efficacy of opium, 1637.
Natives in the marshy districts of China could not live without opium, 1740.
Prescribed for pains accompanying malaria, 2144, 2160–69, 2185–88, 2203–18, 2225–30, 2235–37.
Deep-rooted belief that opium is a prophylactic, 2706.
Opium largely used in malarial districts, 2718.
Said to be a prophylactic, 2727–30.
Evidently not so considered by Government, 2764.
Cinchona and quinine used, not opium, 3049.
Moderate use beneficial in malarious country, 3183, 3185.
Quinine cannot entirely replace opium, 3334–36.
Quinine does not replace opium as a prophylactic, 3519–22.
Opium not prescribed as a prophylactic, 3574, 25,015–20, 24,197.
Probably relieves suffering in malarial diseases, 3658, 3659.
Beneficial in malaria-stricken regions, 3677, 3687.

MALARIA—*continued.*
Powerful antidote, 3787, 3824–35.
Small daily dose recommended for persons living in marshy places, 3818, 3833–35, 3919.
Sovereign remedy for malarial diseases, 3882–84.
Habitually used as a protective, 3956–62.
Few know that opium is a preventive, 4277.
Connexion with consumption of opium, 4298–317, 4353, 4540, 4644, 5018–22, 5036.
Opium is an anodyne, not a special prophylactic like quinine, 4724–26, 4737–42.
Value of opium a comparatively new doctrine, 4762, 4782–86.
Opium much used in treatment of malarious diseases, 5171.
Preventive against chills or malarial influences, 5544, 5545.
Assamese believe in opium as a preventive, 5597–5601, 5609, 5639–43.
Opium found useful in districts where malaria is prevalent, 5689, 5738.
Usefulness as a prophylactic or anti-periodic doubted, 5838.
Taken as a tonic in malarial and swampy districts of Bengal, 6059, 6069–76, 6110, 6200, 6214–18, 6229–31.
Remedy against miasmic influences, 6115, 6118.
People on the paddy fields say it keeps off fever, 6872.
Used as a prophylactic in malarial districts, 6895–99, 6944–46.
Not believed to be a protective, 7232, 7242.
Employed with good results, 7356, 7367–69.
Effectual prophylactic against malaria, 7422, 7491, 7499.
Used as a prophylactic by Burmese coolies, 7802; by fishermen and foresters, 8184, 8187.
Used by natives in damp and malarious places, 8559, 8763, 8791, 8792, 8871.
Assamese use opium as a preventive, 9017–19.
Never used in Jessore as a preventive, 9326.
Assamese to some extent believe in the prophylaxis of opium, 9773, 9774, 9804, 9813–15.
Possible increase of mortality in malarial districts if opium stopped, 9826, 9827.
Never considered to be a protective against malaria, 9852.
Belief that opium is a preventive new, 9961.
Opium-eaters suffer most from *kala-azar*, 10,009.
Opium-eaters much less affected by the *kala-azar* than others, 10,038, 10,052–78.
Opium a necessity in malarial districts, 10,205.
Sustains people in damp and malarial districts, 10,362.
Two-thirds of the opium-eaters live in malarial places, 10,392.
Few opium-eaters succumb to the *kala-azar*, 10,440–44.
No medical authority advocates its prophylactic powers, 10,727.
Successfully used as a medicine in malarious tracts, 10,782
Effect of malarial climate on consumption of opium, 10,840; reckoned a valuable prophylactic, *ib.*
Idea that opium is a valuable prophylactic is common among the people, but new to official statements, 10,866.
Believed to be useful in the damp and malarious districts where the habit is so common, 11,688.
Not specifically useful in malarious districts, 11,852–57.
Cheapest home prophylactic in malarial places, 11,893–96.
Generally beneficial in damp districts, 12,850.
Consumers enjoy immunity from malarial fever, 13,684.
Greatest medicinal use in malarial districts, 13,844.
Per-centage of consumers higher in malarial districts, 13,881, 13,884, 13,904.
Protective idea new, 13,997, 14,001.
Superior to quinine in certain cases, 14,086–96.
Largely used as a febrifuge in jungle tracts, 14,233.
Not comparable to quinine as a prophylactic, *ib.*
Diminishes risk of attack of ague, *ib.*
Most valuable drug, 14,312.
Useful in low-lying countries, 15,822, 15,832–38.
Not a direct prophylactic, but assuages pains accompanying malaria, 15,913.
Preventive against malarial fevers and their *sequelæ*, 15,971–77.
Advantages of opium as a prophylactic known in 1887, 15,982, 15,997–16,001.

MALARIA—*continued.*

Not a prophylactic, 16,557-59, 16,599-607.
Not an anti-periodic, 16,902.
Excellent drug at cold stage of fever, 16,976.
Popular belief in opium as a preventive, 17,766-75, 17,787.
Opium occasionally useful with quinine, 17,776, 17,777.
Opium taken to counteract ailments due to damp climate, 18,457.
Believed to be used for malarial fever, 18,505, 21,878, 21,901,
Considerably used in malarial districts of Lower Sind, 18,569, 18,579-83.
Arsenic, iron and quinine probably better prophylactic than opium, 18,770.
Keeps off fever, cold and other effects of moisture, 18,795.
Not a prophylactic against fever or enlarged spleen, 18,840-42.
*Nazla* prevalent at Delhi since construction of canal; opium used as a preventive, 18,903.
Used as a protection against cold and damp; specially taken for *nazla*, 19,037.
People in malarious tracts anxious to cultivate opium, 19,126, 19,135; with view of retaining a small quantity as a febrifuge, 19,136-38.
Doubtless acts indirectly as a prophylactic, 19,191, 19,203.
Widespread belief that it is useful in malarial cachexia, 19,228, 19,235-40, 19,256-58.
Widely used to counteract malaria, 19,316.
Unknown as a prophylactic or cure along the Jumna, 19,406, 19,413-15.
Used in combination with quinine, 19,408, 19,421.
Checks diarrhœa, 19,409; but does not enhance power of quinine, 19,410.
Used with benefit in cases of malarial cachexia, with enlarged spleen and anæmia, 19,442-55.
Consumers not so susceptible to fever as others, 19,494.
Undoubtedly prevents attacks, 19,502.
Largely used in malarial tracts, 19,528.
Anti-periodic action doubted, *ib.*
Useful for diseases which proceed from malaria, *ib.*
Moderate use guards consumer from malarious fever, 19,678.
Not generally believed to be a protective, 19,730.
Considered useful in malarious parts, 19,757.
Chills and fever avoided by use of opium, 19,797.
Keeps off effects of damp climate, caused by construction of canals, 19,877, 19,890.
People suppose it to be a prophylactic, 19,903.
Opium-eaters suffer more than others, 19,912.
Opium not found beneficial, 19,925, 19,941-46, 19,986.
Not prescribed for malaria, 20,015-20.
No doctor ever prescribed opium or any preparation of it, 20,087.
General belief in efficacy as a prophylactic, 20,268, 20,300.
Prophylactic against disease; keeps off miasmatic influences, 20,855, 20,914.
Not necessary as a prophylactic, 21,023, 21,041.
Prevents chills which lead to fever, 21,042.
Lessens discomfort felt in cold stage, 21,298.
Reputed prophylactic powers first heard of during present agitation, *ib.*, 21,327-29.
General belief that opium-eaters less subject to malarial fevers, 21,417.
Opium will often avert a fever seizure, *ib.*, 21,421.
Prophylactic against fevers and dysentery in the rainy season, 21,962
Belief in efficacy of opium as a remedy and prophylactic, 21,986.
Highest value in treatment of malarial fevers and their sequels, 22,014.
Natives' remedy for malarial diseases, 22,176.
Extreme moisture in air renders opium necessary as a remedy in malaria in Malwa, *ib.*
Protective to agriculturists, &c., in damp climates, 22,277.
Sovereign remedy in malarious fevers, 22,385.
Foresters suffering from evil effects of Baroda climate without exception non-consumers, *ib.*
Invaluable as a preventive of malarious fever, 22,598.
Not used as a prophylactic in Kathiawar, 22,847.
Villagers would suffer more if deprived of opium, 22,969.
Opium very beneficial in a malarious country like Malwa, 23,184.
Prevents disease in malarious climates, 23,261.

MALARIA—*continued.*

Very useful in the cold stage of ague, 23,684.
Not reliable as a febrifuge, 24,075.
Not known as a preventive in Junagadh, 24,169-79.
Used with good result as a prophylactic, 24,186, 24,191.
Not medically prescribed as a prophylactic, 24,197.
Beneficial effect in malarious fevers, 24,407, 24,418-20.
Valuable remedy in malarial fevers, 24,675.
Other remedies preferred as prophylactic, *ib.*
Enables people to withstand malarious fevers, 24,727.
Consumers, otherwise predisposed, escaped fever, 24,739.
Opium gives more relief than any other remedy in certain stages of malarial poisoning, 24,867.
Preventive and curative in malarial fever, 24,904.
Generally regarded as a preventive against fever and rheumatism, 25,061.
Consumed in malarious districts chiefly as a prophylactic, 25,227.
Natives have profound belief in efficacy of opium, 25,297.
Speaking scientifically, not a prophylactic; beneficial in damp climates, 25,308, 25309.
Use in malarious districts probably common on account of relief afforded from neuralgic pains, 25,361.
Consumption very large in hill tracts of Jeypore; district highly feverish, but inhabitants very healthy, 25,371.
Native belief in opium as a preventive probably erroneous, 25,382.
European practitioners prefer quinine and arsenic, 25,383.
Necessity to the poor in malarious districts, 25,412.
Used with great effect as a protection against fever in hill tracts, 25,565.
Considered invaluable as a prophylactic, 25,583.
Absolute necessity to people in malarious districts, *ib.*
Prophylactic in malarial diseases, 25,663.
Use of opium as a prophylactic not heard of, 25,727.
Sometimes prescribed with quinine to prevent recurrence, 25,769.
Saves many lives in malarial fevers, 25,797.
Successfully prescribed with quinine in cases of ague, 25,862.
Cuts short an attack of ague, 25,886.
Prophylactic against fever; prevents chills, 25,906, 25,916
Opium largely used during the monsoon, when fields are flooded, 25,913-17, 25,929, 25,932*a*.
Reputed a prophylactic against malaria; not so used in Bombay, 25,957.
Used as a prophylactic, with beneficial results, 25,988.
Prophylactic against fevers, chills, rheumatism, 26,002.
Potent factor in conferring immunity from malarious diseases, 26,024.
Not used as a prophylactic in Poona, 26,041.
Beneficial in feverish districts, and during the hot weather and monsoon, 26,148.
Consumption exceptionally high in Broach feverish district, 26,181, 26,251.
A little opium with quinine has very good effect, 26,388-90.
Opium never asked for as a remedy, 26,540.
Very valuable in neuralgia and headache caused by malarial poisoning, 26,614, 26,640.
Much in vogue as a prophylactic, 27,135.
Believed to be a protection against chills and malarial influences, 27,418, 27,428, 27,435.
Generally taken to mitigate sequences of ague, 27,436.
Opium a necessity in malarious districts, 27,574.
Prevalent belief in Kathiawar that opium is a sure preventive in malarious fevers, 27,696.
Believed to be specially useful in malarious districts, 27,836, 27,858.
Used to prevent malarial fever, 28,107, 28,115.
Strong probability of correctness of native belief in value as a prophylactic, 28,141.
Memorialists admit that opium is useful as a prophylactic, i. 142.
Prevalent belief that opium is beneficial in marshy countries, i. 141.
Habit much more common in unhealthy districts, i. 145.
Probably not best prophylactic, but useful and cheap, ii. 409.

MALARIA—*continued.*

Taken to escape malarious fever and other evil effects of damp climate, ii. 411, 437.
Popular belief in use as a preventive, ii. 414.
Curative and prophylactic in malarious fevers, *ib.*, 415.
Habit prevalent in swampy fever-stricken districts, ii. 416, 437.
Cannot be replaced as a remedy against malarial maladies, ii. 444.
Powerful prophylactic and remedy in almost all malarial diseases, ii. 460, 461.
Prophylactic and curative agent in malarial disease, iv. 505.
Chinese have great faith in opium, v. 153 (par. 14).
Opinions, on value as a prophylactic, collected in Straits Settlements and Hong Kong, v. 155–209 (par. 14); in China, v. 213–343 (par. 13).

*See also* FEVER, MEDICINAL USE.

MALAYS:

Very few of the Perak Malays addicted to opium, 1637.
Per-centage of opium smokers small, v. 147, 149.
Effects decidedly worse than on Chinese, v. 148.
Condemn smoking as sinful and degrading, v. 151.

*See also* STRAITS SETTLEMENTS.

MALWA AGENCY:

Comprises all opium-growing States in Central India, 1531.
Agency started in 1830, 1564.
Growth of poppy, 157; fall in price, 158; transit duty reduced, 159, 160.
Crop much more valuable than in Behar, 2,053.
Ninety per cent. of the thakurs use kasumbha, 19,729.
Malwais take opium from childhood, 19,211.
Poppy cultivation, 19,734–46.
Prohibition would ruin the province, 19,815.
Owes its prosperity to opium, 21,789.
Production in most Malwa States exceeds demand for local consumption, 21,807.
Export forms large amount of revenue, *ib.*
Substitutes for poppy regarded with disfavour, 21,869.
Between 20 and 30 per cent. of the population consume opium, 21,877.
Ten per cent. of women take opium over 35, 21,912.
Cultivated classes all more or less opium-eaters, 21,980.
Soil and climate extremely favourable to opium, 22,176.
Prohibition would encounter stubborn resistance in Malwa, *ib.*
Might cause immense loss of life and bloodshed, *ib.*
Probable loss to the State if opium prohibited, 22,182–89.
Rate for land would be one quarter of present figure, 22,186.
Wheat only crop available as substitute for poppy, 22,192; would not pay so well, 22,303.
Land revenue settlement fixed for 12 years, 22,194.
Habit fairly general among older men in the Army, 22,199.
Consumers amount to one third of population, 22,278.
Prohibition would cause much loss of revenue to landowners, 22,298–302.
Loss to merchants through prohibition, 22,308–19.
Opium consumed by large per-centage of people in Neemuch, 22,321.
Impossible for Native States to do without opium revenue, 23,185.

*See also* BHOPAL, GWALIOR, INDORE, NATIVE STATES.

MALWA OPIUM:

Exports have largely fallen off, 1531, 1561, 1578.
Imports into Newchang in 1881, only one half of imports in 1879, 1637.
Commands better price than Bengal opium, 2069.
Trade with China falling off, 2070.
Proposed prohibition of export, 10,841, 10,870.
Boiled like other opium, 16,246.
Imports into Faridkot State, 16,372.
Sometimes imported into Jeypore, 20,237.
Nearly all produce exported to China, 20,831.

MALWA OPIUM—*continued.*

Dholpur opium bought up for the Agency, 21,655.
Method of manufacture, 21,869.
Only best quality exported to China, 22,133–41.
Opium the "black coloured gold" of Malwa, 22,167.
Called Kalikadevi or Black Goddess, 22,363.
Foreign exports, 1883–94 to 1892–93, 26,139.
Exports for consumption in British districts and Native States, *ib.*
Cultivation in Native States in Central India and Rajputana, and territory of the Gaikwar, i. 135.
Consistency higher than Bengal opium, *ib.*
Average annual export of opium, *ib.*; of poppy seed, i. 136.
Value of opium and seed consumed in Native States, *ib.*
Could easily be smuggled in British territory if opium prohibited, i. 143.
States where produced, ii. 346.
Cultivation and manufacture, ii. 347.
Weighments at principal scales, 1883–84 to 1892–93, *ib.*
Consumption in the Punjab, Madras, and Bombay, 1883–84 to 1892–93, ii. 350–52.
Imports into Baroda and other Native States under Bombay, 1883–84 to 1892–93, ii. 353.
Imports into Baroda, 1891–92, ii. 355.
Analysis, ii. 405, 406.
Return of opium passed the scales, 1878–79 to 1892–93, iv. 415–17.
Retail price of opium, iv. 417.
History of arrangements regarding opium, iv. 455.
History of treatment of, and existing arrangements with regard to, in the Punjab, v. 104.
Consumption in the Punjab, 1883–84 to 1892–93, v. 105, 106.

MALWA SYSTEM:

Views of the Anti-opium Society, 463–497.
Arrangements for levying transit duty, 963–69, 977.
Native States responsible for enforcement, 990, 991.
System of pass duty, 1538.
Policy to raise duty as high as possible, 2077.
Transit duty system, 2445, 2527.
Bengal monopoly system preferable, 2469.
Inaccuracy of statement that extension of cultivation is due to policy of British Government, 2495–2507.
Substitution of system for Bengal monopoly would increase production, 2928.
Transit duties in Nabha State, 16,300–12.
Steps taken by Government of India to control production, 21,809.
Regulations governing import into British territory, i. 135.
Bombay pass duty, 1880–81 to 1893–94, ii. 342.
British revenue limited to pass duty, ii. 347.
Origin of the Malwa system of pass duty, ii. 371.
Wide prevalence of smuggling, ii. 372.
Proposals for introducing system in Bengal, *ib.*
Opposed by Bengal Government and Board of Revenue, ii. 373.
Views of the Bombay Government, ii. 374.
Views of Sir Charles Trevelyan, ii. 375.
Proposals of Sir W. Muir, *ib.*
Condemned by Bengal Board of Revenue, ii. 376; and by Bengal Government, ii. 377.
Views of Mr. R. B. Chapman, ii. 378.
Views of Major Baring adopted, *ib.*
General conclusions by Government of India, ii. 383.
History of the Malwa system, ii. 446.
Former measures for stopping export to China, iv. 455.

MANAVDAR:

Consumption of opium, 24,451.
Arrangements regarding opium, 24,455–57.

*See also* NATIVE STATES.

MANCHURIA:

Poppy grown in the interior, 18,516.
Drug used in moderation with harmless results, 18,517.
Instances of excessive consumption rare, 18,518.
Indian opium only used to flavour the home-made drug, 18,521.
Imports of Indian opium, *ib.*, 18,559.

MANCHURIA—*continued.*
Cultivation permitted but not officially recognised, 18,522.
Smoking nominally illegal, but practised without concealment, *ib.*
*See also* CHINA.

MANCHUS:
30 per cent. use of opium, v. 229, 267; 25 per cent., 231; 20 per cent., 232; more than half adult males, 262.
Smoke more than the Chinese, v. 237, 276.

MANDSAUR:
Return of opium passed the scales, 1882-83 to 1892-93, iv. 415–17.

MANGO TREES:
Cutting down trees for opium chests objected to, 11,017, 11,034, 11,035, 11,094, 11,095.
Use of trees for opium chests tremendous loss to the country, 11,447, 11,501-3, 11,657–59.
Groves cut down more than replaced by new plantation, 12,150–54.
Used for opium chests, ii. 321.

MANSA:
Consumption of opium by the different races, 24,657.
*See also* NATIVE STATES.

MANUFACTURE:
Present system gives full control over the drug, 10,856.
Two to four thousand hands employed in the Ghazipur factory, 13,477, 13,498–500.
Wages compared with agricultural rates, 13,501–7.
Standards at the Government factories, i. 134.
Extraction and manipulation, ii. 320.
Manufacture of provision opium, ii. 321.
Amount manufactured and cost per chest, 1882–83 to 1891–92, *ib.*

MARWARIS:
Men of considerable intelligence, good business men; whole community reputed opium consumers, 1112, 28,124.
No finer, more intelligent or active men than the opium-consuming Marwaris, 1114.
Noted for opium eating; most intelligent merchants, 3780.
Habitual consumers; effect not noticeable, 3810, 3843.
Large consumers of opium, 4096, 4101, 4112–14.
Opium habit fairly common, 6048–52.
Most astute traders; well-known opium-eaters, 19,527.
Next, after the Rajputs, as opium consumers, 19,898.
Opium-eaters do not personally conduct their business, 19,923, 19,949.
Larger proportion use opium immoderately, 19,950.
Among the largest opium-eaters, 25,883.
Shrewd business men, though habitual opium-eaters, 26,026.
Opium-drinking prevalent, 27,179.
Almost invariably use opium, yet are best business men, 27,567. 27,592.

MARWARIS—*continued.*
More or less used to opium well fed; opium does them no harm, 28,016.
Morally, no way inferior to non-eaters, *ib.*
No more businesslike, frugal and accurate people, *ib.*
Notwithstanding daily consumption of opium are successful merchants, ii. 419.

MASALADAR:
Spiced opium pills, 21,128, 21,150, 21,156.

MAURITIUS:
Indian opium imported, 1868–69 to 1893–94, ii. 335 390.

MAWA:
Crude opium, 21,128, 21,150, 21,156.

MEDICAL OPIUM:
Opium manufactured for use of medical department, ii. 322.
Quantity manufactured and issued, and value, 1883–84 to 1892–93, ii. 329.

MEDICAL STATISTICS:
No reliable statistics available as to causes of death, 3568–72.
Details of cases, 4718.
Analysis of cases of 4,409 opium-eaters, iv. 381.
List of children given opium, iv. 382–384.
Data of 100 cases of opium-eating, iv. 404.
*See* DISEASES.

MEDICINAL and *quasi*-MEDICINAL USE:
Medical aspect of the opium question, 79–84.
Opium valuable in diarrhœa and often in dysentery, 225.
Medical value of opium outweighed by danger of contracting habit, 240–45.
Invaluable when prescribed medicinally, 695.
Therapeutic value of opium undoubted, 1146.
Used in dysentery, diarrhœa, cholera, rheumatism, neuralgia, diabetes, cough, &c., *ib.*
Patent medicines containing opium best remedy for colic, diarrhœa and constipation, 1627.
Gives relief in diabetes, consumption, rheumatism, gout and bowel complaints, 2706.
Panacea for many diseases, 2726–30.
Taken for rheumatic pains and dysentery, 3048.
Opium as a rule first used medically, 3266, 3279–83.
Enables people to stand the effects of chills; preventative of diarrhœa and dysentery, and for treatment of asthma and diabetes; also a prophylactic in treatment of malarial fevers, 3519–22.
Remarkable benefit from using opium, 3606, 3607.
Relieves dysentery and rheumatism, 3658, 3659.
Small doses aid digestion, prevent diarrhœa and dysentery, 3723-27, 3759, 3763.
Opium relieves pain and suffering, 3816; and checks diarrhœa, 3826.
Preventive measure against diabetes, 3856, 3857.
Remedy for pains, rheumatism, asthma, and bowel complaints, 3882.
Much taken in cases of diarrhœa, dysentery, diabetes, and asthma, 3948.
Persons of 30 or 35 use opium for rheumatism, dysentery, or diarrhœa, 4025.
Indian complaints seem to need opium, 4158–65.
Useful to elderly people in cases of chronic disease, 4194.
Arrests wear and tear of the body, 4206–9, 4216–20, 4253.
Used for medical purposes by 25 per cent. of upper and middle classes, 4263, 4264.
Sometimes used for rheumatism, 4353–57.
Only prescribed for disease, 4433; not for dietetic use, 4434–39.
Efficacious in bowel complaints, &c., 4442.
Increases power of digestion and prevents decay, 4443–45.
Quotations from Sanskrit text-books, 4456–72.
Preventive of elephantiasis, 4502, 4503, 4575, 4616–7.
Recommended for bowel complaints, inflammatory fever, and elephantiasis, 4575.
Opium taken for rheumatism, 4616, 4624–29.
Detailed statement of value as a medicine, 4639–45.

MEDICINAL and *quasi*-MEDICINAL USE—*continued*.

Relieves from rheumatic pains, bronchial affections, bowel complaints, and diabetes, 4709, 4718, 4769.
Opium one of the most reliable therapeutic agents for relief of pain, 4718.
General feeling that opium is a good preventive of rheumatism, 4992.
Taken as a preventive against chills, 6298–301.
Not much value in relieving pain, 6320–22.
Usually recommended by opium-eaters, 6323–26.
Used for pain, diarrhœa, dysentery, and rheumatic pains, 6688; insomnia, diarrhœa, and pains, 7326, 7356.
Opium used to a small extent for diarrhœa and wounds, 7875, 7876.
Used only as a remedial and preventive agent by the Mahomedans, 8406, 8476.
Description of opium in oldest books on medicine, 8459.
Protective against damp, malaria, diarrhœa, &c., 8559, 8578, 8870, 8871.
Mostly used by well-to-do classes for relief of pain, 8805.
Used for diabetes, 9775.
Biggest opium-eaters escaped in cholera times, 10,175.
Highly useful as an anodyne, 10,205; and in cases of bowel complaints, *ib.*, 10,240–43, 10,332.
One of the choicest gifts of heaven for relief of suffering, 10,393, 10,495.
Supposed to be useful in fever, elephantiasis, dysentery, rheumatism, and diarrhœa, 10,638.
Highly extolled for diarrhœa, diabetes, dysentery, asthma, &c., 10,727.
Used in typhoid fevers, cholera, constipation, mania, &c., 10,745.
A specific in cases of diabetes, 10,782.
Valuable in certain cases of disease, 11,862.
Relieves from effects of diabetes, 11,893.
Prescribed with best effects in cases of senile gangrene, 12,493, 12,496.
One of the most valuable drugs known; relieves many complaints peculiar to natives, 12,585.
Good medicine for cholera; given as a prophylactic, 12,645.
Only consumers believe in its medicinal properties, 12,661–64.
Native physicians use opium as an anodyne, 12,811.
Much used in cholera, diarrhœa, dysentery, asthma, eye diseases and rheumatism, 12,832.
Prescribed for the cold, 12,854–56, 13,677.
Used as a protective against diseases like asthma, 12,960, 13,026.
One of the most invaluable therapeutic agents known, 13,111.
Opium of great use in cases of rheumatism, diabetes, diarrhœa, asthma and bronchitis. Invaluable in peritonitis and after pains, 13,324.
Efficacious for colds, sore eyes, and rheumatism, 13,416, 13,417.
Checks dysentery and diarrhœa, 13,661, 13,662, 13,666.
Useful in malarial fever and bowel complaints, 13,684.
Saves many lives in early stage of cholera; useful for bowel complaints, malarial fever, spasmodic affections, rheumatism, &c., 13,884, 13,898.
Medically prescribed for cold and bowel complaints, 13,997, 13,999.
Prescribed with satisfactory results in comparison with other narcotics, 14,060.
Resorted to for chronic rheumatism, diarrhœa, dysentery, fever, colic, diabetes, chest affections, and early stages of cholera, 14,232.
Daily prescribed in the jail and asylum, *ib.*
Opium relieves the active pain accompanying diseases predominating in India, 14,311.
Checks bowel complaints and rheumatism, 14,414.
Beneficial in most diseases, 15,147, 15,280–82, 16,189.
Quotations from Yunani medical books, 15,453, 15,460–64.
Beneficial effects of opium, 15,489.
If really useful as a medicine more women would take opium, 15,675, 15,676.
Prescribed in bowel complaints or as a liniment, 15,617, 15,618; 15,637–42; mostly in form of laudanum or morphia, 15,619.
Beneficial in some cases in preventing catarrhal diseases, 15,705–7, 15,717, 15,879.
Preservative against influenza, 15,753.

MEDICINAL and *quasi*-MEDICINAL USE—*continued*.

Prophylactic and remedy for bowel complaints, 15,822, 15,864.
Prevents waste of tissue, 15,839–43, 15,846.
Intestinal sedative, anodyne and astringent, 15,846.
Prescribed for catarrh and chest affections, common diarrhœa and dysentery, rheumatic and neuralgic pains, 15,913.
Protective against chills, 15,967, 15971; bronchitis, diarrhœa and dysentery, 15,972.
Habitual moderate use, of great benefit in coughs, colds, &c., 16,018; catarrh, eye diseases, colds, 16,072.
Used for diarrhœa, dysentery, colds, eye diseases, rheumatic pains, 16,262.
Colds, rheumatism, catarrh, headache, diarrhœa, and to prevent ill-effects in case of change of water, 16,449, 16,467, 16,501, 16,502.
Catarrh, eye diseases, 16,483, 16,486.
Beneficial for colds and dysentery, 16,688.
Syphilis and chronic rheumatism, 16,849.
Eaten for colds, pains, epiphora, 16,902.
Diarrhœa, dysentery, asthma, lung affection, malarial fever, 16,976.
Used for colds, coughs and fevers, 17,151, 17,172.
Most valuable drug, 17,309.
Gives relief from diarrhœa, dysentery, bronchitis, catarrh and dyspepsia, 17,612.
Prevents diarrhœa, 17,662.
Generally taken for colds and coughs, loss of strength, old age, &c., 17,693.
No other medicine so good for colds, weakness, sleeplessness, 17,730–35.
Should be allowed for medical or quasi-medical use, 17,948.
Not much used by the Yunani-Hakims and Vaids, 17,951–53.
Very useful as a medicine, 18,027.
Persons after 40 take small quantities to prevent colds, 18,055.
Opium-eaters prescribe opium for all diseases, 18,210.
Used for phlegmatic diseases, dyspepsia, and cataract, 18,427.
Persons suffering from long-standing cough, asthma, &c., use opium, 18,569.
Often used as a remedy for syphilis, phthisis, scrofula, and rheumatism, 18,736.
No great difference in power of recovery from pneumonia between opium-consumers and others, 18,772.
Mostly used for coughs, bowel complaints, or rheumatism, 18,819.
Opium is an anodyne and hypnotic, and astringent, 18,853.
Relieves headache and pains, 18,868.
Elderly people affected with chronic cough take opium with benefit, 18,957, 18,969.
Medical use does not include taking opium to sustain failing powers, 19,070–72; nor application for pains, 19,074–76.
Generally used by old people as a preventive of catarrh, 19,083.
Often prescribed for pneumonia, 19,206.
Belief that opium is good for cataract and other eye diseases, 19,228, 19,251.
Beneficial in bowel complaints, chronic cough, syphilis, ulcers, &c., 19,235.
Used in minute doses to alleviate suffering, 19,316.
Invaluable drug for which no substitute, 19,356, 19,384.
Prescribed for catarrh, rheumatism, &c., 19,391.
Used as a remedy for catarrh, 19,424.
Used for asthma, dysentery, rheumatism, and colic, 19,495.
Beneficial in rheumatism, cough, asthma, or bowel complaints, 19,528.
Small dose, followed by sweets, milk, or *ghi*, is nourishing and prevents disease, 19,675.
Generally useful in catarrh, cough, diarrhœa, and eye diseases, 19,676.
Most useful drug in the country, except quinine, 19,442.
Largely used in asthma, chronic rheumatism, bowel complaints, &c., *ib.*
Beneficial in headache, insanity, catarrh, cold, pains, diarrhœa, dysentery, fever, &c., 19,777.
Prevents diarrhœa and other diseases, 19,792.
Gives relief from cold, catarrh, asthma, &c., 19,797.
Beneficial to persons suffering from cold, diarrhœa, or dysentery, 19,883, 19,887, 19,890.

MEDICINAL and *quasi*-MEDICINAL USE—*continued.*

Useful for diarrhœa, rheumatic pains, and such like, 19,987, 20,015.
Medical authority for use of opium, 19,991, 20,007, 20,012.
Prescribed for gout, rheumatism, diarrhœa, dysentery, or cold, 20,047.
Medicine does not produce normal effect on opium eaters, *ib.*
Powerful as an astringent in diarrhœa; useful in rheumatism, 20,131.
Taken especially for dyspepsia, diarrhœa, bowel complaints, and affections of the lungs, 20,168.
Passages from Sanskrit medical works, 20,179.
Best, safest and cheapest drug for relief of pain, 20,263.
Enumeration of diseases in which opium beneficial, 20,269, 20,270.
Hypnotic and anodyne qualities render opium most important drug, 20,272, 24,622.
Taken for coughs and colds, 20,342.
Best remedy for bowel complaints, spasmodic affections, rheumatism, cough, asthma, &c., 20,855.
Prescribed for bowel complaints and chills, 20,877–80.
Used for pneumonia and general uneasiness, 20,990.
Serviceable in asthma if skilfully administered, 21,298.
Largely used in bowel troubles, rheumatic pains, neuralgia, asthma, chronic cough, dyspepsia, &c., 21,418, 21,443.
Cures piles, and other ailments, 21,577.
Gives permanent relief from epileptic fits, 21,590.
Valuable drug for the natives, 21,812.
Used for rheumatic pains, dysentery, diarrhœa, and diabetes, 21,878.
Decoction from poppy heads used with camomile as a local application, 21,989.
Cures evil effects of cold and heat; cough, asthma, fever, bowel complaints, diarrhœa, rheumatism, dysentery, diabetes, &c., 22,167.
Habitual use prevents cold, indigestion, asthma, diarrhœa, &c., 22,277.
Commonly used as protection against colds, chills, &c., 22,359.
Sovereign remedy in dysentery, diarrhœa, bowel and lung affections, and diabetes, 22,385.
Used for chronic diarrhœa, cough, asthma, and chest affections, 22,496.
Holds an important place in European and Native pharmacopœias, *ib.*
Prevents dysentery and diarrhœa, and invigorates the system, 22,579.
Affords relief against dyspepsia, diarrhœa, asthma, diabetes, rheumatism, 22,654.
Regarded as a valuable medicinal agent, 22,665.
Useful in diseases like asthma, 22,806.
Useful in asthma, consumption, and bowel complaints, 22,843.
Used for colic, diarrhœa, rheumatism, asthma, dysentery, and neuralgia, 22,847.
Beneficial in diabetes, bronchitis, diarrhœa, dysentery, 23,684.
Prevents cough and bronchitis, helps to keep away disease, 23,751.
Cure for rheumatism, asthma, diarrhœa, relieving pain, &c., 23,874.
Some practitioners refuse to prescribe opium at all, 23,491*a*.
Useful in dysentery, diarrhœa, diabetes, chest affections, rheumatism, and neuralgia, 24,075.
Extensively prescribed by Native physcians, 24,115.
Most useful drug in many organic diseases, 24,362.
Checks dysentery, asthma, or weakness, 24,389.
Beneficial effect on rheumatism, cough, and other maladies, 24,407.
Largely used for diarrhœa, dysentery, cough, &c., 24,518.
Freely used by non-consumers in cholera epidemic *ib.*
Specific in diarrhœa, rheumatism, asthma, 24,566.
Used in diabetes, asthma, sciatica, and such painful ailments, 24,675.
Relieves pain; is a powerful anodyne, 24,714.
Prophylactic against diarrhœa, ague, and cholera, 24,739, 24,777.
Opium used subcutaneously in acute mania, 24,789–91.
Used in asthma, diarrhœa, dysentery, rheumatism, spasms, and diabetes, 24,904.
Specific in dysentery, diarrhœa, diabetes, rheumatism, and bronchiti s, 25,227.

MEDICINAL and *quasi*-MEDICINAL USE—*continued.*

Natives believe in opium as cure for diarrhœa and cholera, 25,297.
Useful in bronchitis, lung disease, and dysentery, 25,306.
Used for diarrhœa, coughs, asthma, bowel troubles, neuralgia, syphilitic and other inflammations, pains, cramps, sleeplessness, palpitation, uterine disorders, excessive urine, and spermatorrhœa, 25,395.
True prophylactic action against disease unknown, 25,411.
Valuable drug in relieving pain, particularly in unhealthy districts, 25,412.
Used for diarrhœa, dysentery, fever, ague, rheumatism, &c., 25,583.
Used in diabetes, diarrhœa, cholera, dysentery, rheumatic pains, &c., 25,663.
Preserves lives of those subject to chest and intestinal complaints, 25,797.
Used for relief of pain, checking diarrhœa, and asthma, 25,824.
Used for coryza or cold, diarrhœa, and rheumatism, 25,886.
Regulates the peristalsis of the intestines; prevents diarrhœa, 25,904.
Used for cough, asthma, diarrhœa, colic, toothache, diabetes, dysentery, rheumatism, &c., 25,906, 25,988.
Undoubtedly a prophylactic against cholera, 25,957.
Good anodyne in rheumatism, gout, and lumbago, 26,001.
Beneficial in asthma and bronchitis; effects marvellous in diabetes and chronic dysentery, 26,062.
Nothing can replace opium for purposes it serves in the nervous system, 26,386, 26,387.
Beneficial for coughs, colds, and pains, 26,414.
Opium never asked for as a remedy for cholera, 26,540.
Useful for chest and bowel complaints, and neuralgia, 26,614.
Mentioned in old Hindu and Sanskrit medical books, 26,628–31, 26,680–89.
Preventive against diarrhœa; consumers rarely suffer from it, 26,676.
General phophylactic against disease, 26,713, 26,803.
Eastern medicine recommends habitual use during infancy and after 40, 26,775.
Used by Mahomedan embroiderers to check cataract, 26,788.
Used with notable results for diabetes, diarrhœa, dysentery, cholera, colic, chronic lung complaints, &c., 27,135.
Unsafe to use opium in cholera, 27,251–53.
Remedy for diarrhœa and dysentery, 27,428.
Mostly used in diseases brought on by immorality, 27,511, 27,539.
Preventive against many diseases, 27,567, 27,597.
If medicinal value true, opium should not be denied to prisoners, 27,795.
Not recommended as a drug, as it may lead to opium habit, 27,834.
Absolutely necessary as a medicine, 27,885.
Cannot with advantage be replaced, *ib.*
Cheapest and best available medicine, 28,047.
Checks and prevents chronic painful affections, bronchitis, asthma, rheumatism and dysentery, 28,141.
Beneficial in fever, elephantiasis, rheumatism, &c., and when food is scarce, i. 146.
Extracts from medical works, ii. 315.
Remarks on extracts from medical works, ii. 316.
Refutation of remarks on extracts from medical works, ii. 318.
Opium mitigates rheumatic pains, checks diarrhœa, and often cures dysentery, ii. 409.
Opium chief constituent of cholera pills, *ib.*
Appears to act as a preventive of cholera, ii. 413.
Use undoubted in dysentery, diarrhœa, cholera, rheumatism, elephantiasis, neuralgia, diabetes, cough, ii. 414, 415, 416, 437.
Effects in dysentery and diarrhœa, ii. 461.
No physical necessity for opium except in malarial districts, ii. 544.
Generally used for catarrh, iv. 374.
Protects against chest disorders, rheumatism, and diseases of the digestive tract, iv. 379.
Advantages acknowledged in bowel complaints, iv. 505.
Extract from Magzanul Adwiyah, an authoritative book on Yunani medicine, iv. 509.
Chinese have great faith in opium as medicine, v. 153.

MEDICINAL and *quasi*-MEDICINAL USE—*continued*.

Use of opium as medicine in Straits Settlements and Hong Kong, v. 153, 155–209 (par. 14); in China, v. 213–343 (par. 13).

*See also* DOMESTIC REMEDY, FEVER, MALARIA.

MEDICINE, EFFECT ON CONSUMERS:

Consumers do not benefit from treatment like ordinary patients, 225.
Consumers require larger medical dose, 3827, 3931.
If opium continued after cure, there is a relapse of the disease, 4052–54.
Susceptibility to anodyne and hypnotic effects altered in opium-eaters, 4390–92.
Medicine fails to produce re-action on system of opium-eaters, 5833.
Ordinary doses of medicine will not have any effect on an opium-eater, 10,678, 10,727.
Opium-eating patients not benefited by it as medicine, 16,090.
Consumers slightly less susceptible to medicine than others, 16,907.
Ordinary dose insufficient for confirmed opium-eater, 18,510, 23,491*a*.
Habit does not interfere with medical treatment, 21,443.
Habitual consumers proof against overdose, 22,579.
Ordinary dose has little effect on habitual consumers, 23,491*a*.
Opium does no good as medicine to habitual consumers, 24,622.
Opium does not deter action of other drugs upon the system, 25,399.
Treatment, especially of dysentery, greatly modified in opium-eaters, ii. 461.
Interferes with action of medicine, v. 127.

MEERUT:

Three per cent. of male adults take opium, 19,389.

MEMORIALS:

Memorial presented by the Anti-Opium Society in Nov., 1892, i. 162–65.
Memorial of the Committee of the British Indian Association, ii. 313.
Memorial of the Calcutta Missionary Conference, ii. 314, 319.
Memorial from the Bishop of Calcutta, ii. 438.
Memorial of the Jorhat Sorbojanik Sobha, ii. 462.
Resolution passed by the Young Arakan Club regarding opium traffic, ii. 604.
Behar Indigo Planters' Association, v. 136.
North-West Province Methodist Episcopal Church Conference, v. 137.
Burma Branch, British Medical Association, *ib.*
Clergy of the Diocese of Lucknow, v. 138.
Chinese residents in Moulmein, v. 345.
British missionaries in China of over 25 years' standing, v. 353.

*See also* PETITIONS.

MENTAL EFFECTS:

Acts as a stimulant at first; followed by dulled mental state, 389, 420.
Moderate use brightens the intellect, 1005.
Tends generally to quietude and sleepiness; when roused consumers are intelligent and sharp, 1148.
Habitual use causes no general mental deterioration, 1153, 1382.
Merchants find that moderate smoking clears the brain, 1482–85, 1733.
Mental conditions improved, not deteriorated, 1637.
Cleverest and best men smoke opium, *ib.*
Mental faculties not so injuriously affected as physical, 1641.
Does not interfere with business, nor, in moderation, with health, 1661.
Moderate smoking brightens the intellect, 2030.
Opium-smokers not degraded or degenerate, able to carry on their business with great vigour, 2040–49.
Indulgence clouds the brain, 2766.
Stimulates the brain, 3780–82,
Brightens the wits and improves the intellect, 3883, 3908–13.
Produces temporary insensibility, 4958–61.
Sharpens the intellect, 7421, 7472–74, 7509, 25,911.
Habit produces weakness of mind, 9129, 9186, 10,496, 13,024.
Mental susceptibilities blunted, 11,822, 11,832–39.

MENTAL EFFECTS—*continued*.

Excessive use produces drowsiness and inability to work, 12,689–91; sometimes inactivity of brain power, 13,322, 14,414, 26,047.
Excessive consumers become dull, stupid, and indolent, 16,551, 17,131, 17,336, 18,795.
Causing the mental ruin of the people of India, 18,210, 18,249.
Habit leads to great perversion of the faculties, 18,355.
Habitual use makes a man stupid, 19,043, 22,023.
Hebetude of mind . . . worst effect of opium, 19,194.
Destroys memory, brings on idleness and drowsiness, 19,749, 19,885, 19,893.
Induces sharpness at first, followed by sleepiness and stupidity, 19,909.
Brings on sleepiness; people cannot do their work properly, 20,083.
Diminished capacity for business uncommon, except in cases of excess, 20,280.
Excessive use causes mental deterioration, 22,022, 22,055, 23,875.
Consumers as clear-headed as other people, 23,184.
Opium gives vigour and strength; improves intellect, 23,581, 23,595.
Consumers dull, drowsy and inactive, 23,683, 23,875.
Excessive use causes lethargy, 24,087.
Not known to cause any particular mental disease, 24,124.
Does not incapacitate for business; causes some laziness, 24,362.
Sometimes makes a man a better thinker, 24,468.
Opium impairs the memory, 24,595.
Consumers suffer from depression, 24,622.
Habitual users known among successful merchants and bankers, 24,680.
Worst effects are dulness of intellect, drowsiness, and secretive habits, 24,740, 24,744.
Does not interfere with consumers' ability to conduct business, 24,781.
Habit in no way renders consumers inferior to abstainers, 25,059.
Smokers found quite trustworthy and very capable men of business, *ib.* 25,078.
Excessive smoking causes all sorts of evils; sometimes insanity, 25,510, 25,552.
Opium consumers with deranged faculties rarely met with, 25,552.
Smoking produces languor and drowsiness, but no loss of intelligence, 25,658.
Faculties occasionally slightly impaired; not so as to interfere with business, 25,668.
Habitual use injurious, though moderate use may not interfere with business, 25,734.
Gives mental energy; has no evil effects on the intellect, 25,797.
Excessive use produces indifference, inactivity, torpor, and disinclination to work, 25,833.
Moderate use has no deleterious effect, 25,893.
Opium clears the mind and sharpens the intellect, 25,911.
Does not appear to cloud the intellect, 25,912.
Soporific in mental worry and distressed condition of the brain, 25,951–53.
Stimulates the mental faculties without interfering with ability for business, 25,963.
Moderate use sharpens intellect; excessive use causes dulness, 25,991, 26,022, 26,040, 26,064.
Moderate doses produce no mental disability, 26,005.
Does not impair the mental faculties, 26,026.
Brightens the mental faculties, and produces exhilaration, 26,048.
If dose missed the mind becomes confused, *ib.*
Does not cause nerve or brain affections, 26,407.
Excessive smokers occasionally unreliable business men, 26,612.
Moderate use sharpens the intellect; seldom interferes with ability for business, 26,618, 26,679.
Excessive use renders men helpless, unreliable, and unsteady, *ib.*
Moderate use brightens the mental faculties, 26,711.
Excessive use makes the mind torpid, *ib.*
Moderate use does not appear to injure the mental faculties, 26,718, 27,142.
Opium-eating does not harm the mental faculties; chandu and madak are positively injurious, 26,806.
Many good business opportunities lost through opium, 27,021.
Smokers become stupid except when under influence, 27,203, 27,275–78.

MENTAL EFFECTS—*continued.*

Moderate use does not muddle the head or make a man a bad workman, 27,567.
Consumers are industrious and diligent, 27,885.
Great fault of opium-eaters is apathy, 28,064.
Habit produces disinclination to work or mental application, ii. 411.
Nervous system irritated, ii. 551.
Results on mental condition, iv. 377.
Effects of opium on business men and workmen, v. 150, 154–343 (par. 7).

MEYWAR:

Area of irrigated land, 20,447.
Area under poppy, *ib.*, 20,448, 20,489, iv. 400.
Annual average produce, 20,453, iv. 400.
Wheat and barley would probably take place of poppy as a crop, 20,454;
But would entail heavy loss of revenue, 20,455, 20,460.
Winter and summer crops, 20,458, 20,459.
Value and cost of poppy crop, 20,461–67, iv. 400.
Prohibition would ruin credit of agriculturists, 20,468.
Rate of labourers' wages, cost of watering and cutting, &c., 20,472–85.
Rates for poppy and makka land, 20,490–92.
Duty on opium exports, 20,498.
Duty on opium passing through the State, 20,500–2, 20,504.
Mapa cess, a kind of transit due, 20,503; 20,510–15.
Opium sent to the scale at Chitor, 20,504.
No excise; cultivation and sale free, 20,505.
Opium the principal commodity of trade, 20,518.
Prohibition would ruin the general and rural merchants; the whole country would suffer, *ib.*, 20,535.
Loss through prohibition to be made good to the State, 20,521–25, 20,529.
Sum paid to cultivators by rural merchant, 20,526–29.
Cash rent for poppy lands, 20,538–44.
Observations on the Meywar statistics, 21,545–60.
Twenty per cent. of adult males, and 3 per cent. of females, take opium, 27,025.
Consumption of opium in the State, 27,026.
Poppy not calculated upon as safe basis for settling the revenue, 27,027.
Interruption of cultivation would lead to widespread ruin, 27,029.
Would also lead to revision of rates on irrigated land, 27,030.
Prejudice against poppy culture chiefly due to fear of famine, 27,032.
Poppy cannot be replaced as a valuable crop, 27,035.
Land revenue not so high as in many other Rajput States, 27,050–54.
Statistics of poppy cultivation and opium consumption, iv. 392.
Estimated loss to the State, &c., if cultivation prohibited, *ib.*
Statement showing poppy cultivation and initial value and cost of produce of an acre of poppy land, iv. 400.
Statement showing extent of maize cultivation and the initial value and cost of produce of an acre of makka land, *ib.*
Statement showing the difference of profit per acre under poppy, wheat, barley, &c., iv. 401.

MINIMUM VEND GUARANTEE:

Extremely objectionable in its operation, 2426–36.
Working of the system in Baroda, 22,385, 22,424, 22,438, 22,461.
Abolition of the system has done good, 22,670, 22,808, 22,837.
System was intended to stop smuggling, 22,672, 22,745, 22,817, 22,840.
System did not increase consumption, 22,745.
Tempted vendors to increase consumption, 22,808–16, 22,837–41.
Abolition was a mistake, 26,151; of doubtful advantage, 26,261.
System withdrawn in all districts of Bombay, ii. 352.
Description of the Bombay system, iv. 457.

*See also* BARODA, BOMBAY, N.-W. PROVINCES.

MILK:

Useful where opium taken in excess, 3453.
Conducive to health of opium-eaters, 4235–39, 4287, 4288, 4308.
Not believed necessary to opium-eaters, 4681.
Milk and *ghi* necessary to opium smokers, 10,840, 10,868.
Said to remove astringent effects of opium, 17,422.

*See under* EFFECTS.

MISSIONS:

Views on the opium traffic, 2278, 2280, 2281.
Identified with the opium agitation, 5025; accuracy of their information doubted, 5026–30.
Opium no obstacle to missionary work, 5470, 5488–90.
Prejudice against opium unreasonable, 5738.
Opium no hindrance to missionary work, 8667–70.
Facilities for learning real native opinion, 10,686–89.
Prohibition not desired, except by missionaries, 11,897.
Progress of Christianity not impeded by opium, 12,184.
No hindrance to missionary work, 16,902.
Opium does not perceptibly hinder missionary labours, 17,154, 17,252.
Hindrances to mission work through opium, 23,309. 23,326–29.
Confirmed opium-eaters never become Christians, 23,333.
Opium indirectly retards missionary work, by producing apathy to teaching, 24,858.
Non-consumers more accessible religiously, 26,321.
Paid enquiry agents of disreputable character alleged to be employed by missionaries, 27,089.
Catholic Missions find opium no obstacle to success, ii. 438.

*See also* WITNESSES.

MOHTAT:

Time for eating dose of opium, 18,210.

MONOPOLY:

System in Bengal, 2069, 2445–53, 2469–76.
System works admirably, 2710, 4448.
If abolished would be followed by joint-stock companies, 2710, 2712–15, 2915.
Should be replaced by prohibitive tax, 2768–71.
Petitions against restrictions of cultivation, 2917–19.
Tends to restrict the trade, 2923–25.
History of Bengal monopoly, 2926, ii. 445.
Malwa system would lead to increased production, 2928.
Malwa cultivator gets more for opium than Bengal, 2994, 2995.
Proposal for abolition now withdrawn, 3277.
Any change would affect the trade with China, 5430.
Only means of controlling production, 5513, 5514.
Government monopoly should not be abolished, 6062.
No better arrangements can be suggested, 6122, 10,985.
Beneficial in every respect, 6192, 6208.
Evils might be much worse if monopoly withdrawn, 6269.
Abolition would not be regretted, 11,329.
No change needed in existing arrangements, 12, 374.
Best system that could be devised, 19,103.
Government arrangements perfect, 19,642.
No State monopoly in Central India except in Rewa, 22,054.
Present system works very well, 27,471.
System of administration, i. 134, 135.
If poppy grown free, consumption would inevitably increase, i. 142.
Origin of the Bengal monopoly, ii. 371.
Account of previous proposals for abolition, ii. 371–83.

MORAL EFFECTS:

Ministers to sensuality; blunts the moral sense, 226.
Smoking dulls the conscience and ruins the will power, 389.
One of the most awful vices that ever afflicted the world, 502.
Appears to destroy all the moral senses, 564–9.
Habit robs Chinese of all the little moral sense they seem naturally to have, 676.

MORAL EFFECTS—*continued.*

Population practically untouched by the opium habit, 702.
Degradation consequent on opium-smoking, 797–9.
Excessive use causes moral degradation, 1641, 1704–7.
Smokers unworthy of positions of trust, 1980.
Smokers not found dishonest in business, 2032.
Disastrous effect through stimulating lustful passions, 2594.
No symptoms of demoralisation, 3779, 14,794, 14,795.
Does not appear to demoralise the working classes, 5174.
Evil effects of the habit, 5833, 5884–89.
Leads to habits of gambling, 6736, 6737.
Moral deterioration attendant on habit, 6957–63.
Destroys all sense of honesty, 6976.
Lower classes take to thieving to provide opium 8478.
Habit is vicious and immoral, 10,596–601.
No dependence can be placed on the word of an opium-eater, 10,616.
No demoralising results noticed, 10,782, 12,813.
Effects on rich and poor consumers, 13,103–6.
Opium alone has no effect on moral condition, 13,938, 14,794.
Leads to falsehood and mendacity, 13,996.
Over indulgence makes victim idle and timid, 14,226.
Habit results in moral depravity, 14,512, 14,515, 14,622.
A cause of vice and misery, 14,693.
Leads to meanness, thieving, and lying to get opium, 16,551.
Not beneficial, takes away power of self-control, 17,287–93, 17,310–12.
Many of the middle classes demoralised by the habit, 17,900–4.
Moral sense is gradually lost, 18,095.
Causing the moral and spiritual ruin of the people, 18,210, 18,249.
Idea that system produces demoralisation controverted by figures, 19,534.
Excessive consumers will tell lies and pilfer to get opium, 19,910.
Not a serious cause of general degradation; immoderate use very hurtful, 20,769.
Injures the moral character, and makes men inattentive to duty, 21,506, 21,532–35.
Opium not considered to affect the morals, 21,655.
Effect not so bad as alleged, 22,893.
Lowers and weakens the moral nature, 23,309, 23,333, 23,457.
Opium-eaters are untrustworthy, 23,518, 23,535, 24,538.
Produces no bad effect, 23,626, 23,657, 23,908, 23,926, 23,948, 24,075.
Chandu smokers generally dregs of society, and gamblers, 23,682.
Never breeds evil; has a quieting effect, 24,124, 24,184, 24,187, 24,202, 24,406.
No special effect on morality, 24,362, 24,374.
Effects no change on moral condition, 24,452, 24,468, 26,256.
Tends to moral improvement, 24,468, 24,482.
No baneful effect on the moral condition, 24,235.
Habit has no effect on the nation, 24,980, 25,101, 25,110.
Worst effects are irritableness and unfitness for work. 25,405.
Impairs the moral sense and induces laziness, 25,511.
Loss of moral power not an inevitable consequence of opium smoking, 25,568.
Does not make a man a criminal or a bad father or husband; makes him cowardly, indifferent, and easily duped, 25,656.
A thoroughly moral man would neither take opium nor alcohol in quantity, 25,743.
Consumers habitual liars and immoral, 26,286–304, 26,320, 26,353–59.
Opium smokers by no means habitual liars, 26,556.
Slander to suggest that consumers have no moral stamina, 26,612.
Calms the passions, promotes thought, and sharpens insight, 26,775.
Makes a person forbearing and patient, though somewhat slow, 26,801.
Habitual consumers lose all moral sense, 27,004.
Opium consumers old jail birds and born liars—except when they echo missionary views, 27,089.
Smokers seem to have little moral sense, 27,203, 27,275–78, 27,328, 27,364.

MORAL EFFECTS—*continued.*

No moral distinction between opium-eaters and others, 27,462.
Blunts the moral sense and makes people dishonest, 27,511.
No adverse effect on moral condition, 27,566, 27,570.
No case of injury noticed, 27,731.
No moral evils result from opium-eating, 27,885.
Opium not necessarily injurious to morals, 28,046, 28,049.
Consumers not necessarily liars or evildoers, 28,064.
Majority of consumers quiet, well conducted people, 28,141.
Effects of opium on different races in the East, v. 148, 154–343 (par. 3).

MORPHIA:

Consumption largely increasing in China, 836.
Not absorbed in process of smoking, 837–40, 1671.
Morphia-eating and opium-smoking and eating interchangeable habits, 842.
Decomposition in the opium pipe, 1157–61, 1671.
Amount in Indian compared with Turkish and Egyptian opium, 1159.
Popular in Singapore, 2258.
Not much used by natives of India, 3399.
Effect much greater in European countries, 3492.
Habit of taking considerable quantities condemnable, 3851–54.
Always taken under medical advice, 4641, 4642.
Medicinal opium ought to contain 10 per cent., 16,902.
Very few Hindustanis take it, 18,795.
Hypodermical injection not common in Bombay, 24,149.
Practice unknown as a cure for opium habit, 24,156.
Cases of abuse in England, 27,753, 27,775.
Consumption almost unknown among Rajputs, Marwaris, Mahomedans, and Bombay banias; more usual among Bengali Babus, ii. 414.
Morphine value of different opium-smoking preparations, v. 195, 196.
Reports on morphine injection, v. 209–12.

MORVI:

Consumption of opium, 23,834–39, 23,849, 23,856.
Arrangements regarding opium, 23,856.
*See also* NATIVE STATES.

MURSHIDABAD:

Proportion of opium consumers, 2594, 2634–49.
Wretched condition of population due to malaria not opium, 2711.
Not so many as 90 per cent. of Mahomedans use opium, 8562, 8569; great many do take opium but not all, 8575.

MYSORE:

Cultivation of opium strictly prohibited, 2764.
Arrangements regarding opium, ii. 357.
Instrument of transfer, 1881, art. 18, ii. 370.

## N.

NABHA:

Consumption of opium, 16,280.
People engage not to begin opium habit without medical advice, 16,283.
If prohibition introduced into British India, efforts would be made to extend it to the State, 16,286, 16,287, 16,316.
Arrangements to prevent illicit import of Malwa opium into Nabha, 16,288.
Prohibition being beneficial, Nabha State does not wish for any compensation, 16,289.
Revenue from opium, 16,300–11.
*See also* NATIVE STATES.

NAHAN:

Opium-eating very rare among the hill men, 16,328.
People would resent any interference with the custom, 16,331; and certainly object to be taxed for the purpose, 16,332.
Difficult if not impossible to prohibit opium, 16,353.
Export; smuggling into other States, 16,337. 16,342.
Revenue to the State from opium traffic, 16,340–58.

NAHAN—*continued.*
Compensation expected if cultivation prohibited, 16,350.
Average annual production, 16,353–55.
Letter from H. H. the Raja, v. 125.
Consumption of opium amongst the hill-men, *ib.*
*See also* NATIVE STATES.

NARCOTICS:
In use from time immemorial, 2706.

NARCOTINE:
Sometimes used as an anti-periodic, 11,853, 14,233.
Opium probably used for the action of narcotine in it, 12,635–38.
Now replaced by quinine, 12,639.
Largely used 25 or 30 years ago, 13,484.
Principal alkaloid in Bengal opium, 13,485–87.
Very good substitute for quinine, 13,887–91.
Use as a prophylactic discontinued, 16,558, 16,602.
Prescribed for malarial fever, 18,505–7.
Property in opium useful in malarial diseases, 25,308.
Known to possess considerable anti-periodic powers, 26,024.
Employed with success in Bengal instead of quinine, i. 145.
Successful in treatment of ague, ii. 409.
Correspondence regarding use as a febrifuge, v. 76–83.
Statement showing quantity issued, 1860–76, v. 82; 1876–94, v. 83.

NARSINGARH:
Estimated loss through prohibition, 23,130–49, iv. 407.
Area under cultivation, 23,145, 23,153.
Statistics regarding opium, iv. 408.
*See also* NATIVE STATES.

NATAL:
Imports of Malwa opium, 1883–84 to 1892–93, 26,139.
Indian opium imported, 1880–81 to 1892–93, ii. 335, 390.

NATIVE CHURCHES:
Opium consumers not admitted, 2302–5, 2368–70.
15 per cent. of members consume opium, 12,652; 5 per cent., 13,411.
Habitual consumers not retained as members, 14,019.
Opium not a bar to membership in India, 16,925.
No opium-eater admitted to membership, 21,493.
Habital users not allowed to be communicants, 23,329, 23,341.
No restrictions would be raised if opium habit not considered a very serious evil 23,525–29.
Classification of native Christians in Malabar, 25,563.
Converts placed under discipline for use of opium, alcohol and ganja, 26,342, 26,348, 26,349.
Supposed consumers put to the "opium test," 27,511, 27,542.
Try to enforce total abstinence, 27,543.
Habitual consumers not admitted to membership, 27,824, 27,833.
Opium-users rigidly excluded, 28,168.
*See also under* BURMA, CHINA, MISSIONS, RELIGIOUS OBJECTIONS.

NATIVE SOLDIERS:
Men carefully watched to detect opium-consumers, 735.
Sikh and Rajput soldiers commonly take opium, 927–31, 985–89.
Beneficial effects on the line of march, 1155, 1171–73, 2906–9, 15,753, 15,759, 15,800, 15,879, 15,921, 22,334.
Our regiments are full of opium-eaters, 1559.
Sikhs are all right so long as they get their opium, 1918.
Opium not provided by Government on active service, 1919.
Opium served out to Sikh troops, 3318, 3374–83.
Supply taken for sale by Commissariat, 3406.
Excellent effects during Miranzai Expedition, 3412, 3433–36.
Larger proportion of opium-eaters among older men, 5222–27.

NATIVE SOLDIERS—*continued.*
Might break down if opium stopped, 6846–57.
Proportion of habitual opium-consumers, 12,897–932.
Proportion of opium-eaters, 14,107–23, 14,147–68, 14,181–83, 15,746–801, 15,818–72, 15,883–96, 16,939–63, 17,020–39, 17,043–45, 17,057–60, 17,088–104, 17,108–28, 17,130–34, 17,137–43, 17,568–89, 18,641–79, 18,688–99, 18,704–14.
Sikhs never fail for want of opium, 14,137–38.
Risk of being incapacited on active service if opium fails, 14,169.
Prohibition would cause discontent, 14,170–72, 14,222, 15,756, 15,809.
Recruiting would be affected if opium prohibited, 14,176.
Recruits not questioned as to opium habit, 14,173, 14,204, 15,802–5.
Moderate dose of opium beneficial, 14,184.
Habit does not affect discipline, 15,757, 15,788, 17,563, 17,578.
Opium issued on medical certificate, 15,760–62, 15,783–85.
Excessive consumers are stupid, 15,767–71.
Opium-eating no bar to promotion, 15,780, 15,781.
Opium not issued to the Commissariat on active service, 15,855–61, 15,927.
Opium-eating soldiers and camp followers in the Afghan War, 15,902, 21,782.
Consumption of opium in Sikh regiments, 15,903–6, 15,920–38, 15,940, 15,978–80, 15,987, 15,988, 17,528–65, 19,160–74, 19,189–200, 19,212–24.
Consider opium necessary as they serve in different climates, 16,080.
Prohibition would have bad effect on Sepoys, 16,220.
Opium taken to the Soudan, 17,144.
No bad effects from opium on active service, 17,266, 24,681.
Effect beneficial when men exposed to cold and damp weather, 17,533, 17,564.
Prohibition would lead to great discontent, 17,535, 17,561, 17,584; and increased consumption of liquor, 17,536.
Two or three men invalided, possibly suffering from opium, 17,539.
Four or five soldiers became useless through excess, 17,573.
Special arrangements for supply made in Afghanistan, 17,595–600.
Men generally complain if supply run short, 17,601.
No reason to suppose they would resent prohibition more than other natives, 18,184–87.
Sikhs used opium during march to Kandahar, 18,410.
Opium-eaters possess as much endurance as non-consumers, 18,652.
14th Sikhs attacked with pneumonia in 1878; fell to pieces; whether due to opium habit or malaria unknown, *ib.*
Opium taken with the regiment on active service, 18,657.
Opium-eaters if known would not be taken as recruits, 18,681–84.
Habit does not impair efficiency, 18,689.
More men take opium in the winter than summer, 18,691.
Many take it occasionally for hard work or excessive cold, 18,698.
Habitual opium-eaters are marked men in the regiment, 18,706.
Prohibition would excite very great discontent, 19,164, 19,223.
No foundation for report that 14th Sikhs broke down in Cabul campaign through not having opium, 19,192.
Opium-eating no drawback to enlistment, 19,225.
Consumption of opium in the Erinpura Irregular Force, 21,439–61.
Opium-eaters in the Khas Cauki Irregular Infantry, 21,590, 21,621–23.
No difficulty arises from use of opium, 22,006.
Soldiers do not suffer either physically or morally from opium, 22,009.
40 to 50 per cent. use opium in Indore State army, 22,334.
Opium not served out in Abyssinian campaign, 24,686.
No case of invaliding through opium, 28,141.
Correspondence respecting supply of opium on service, ii. 452, 453.

NATIVE STATES:
Native States have engaged so to manage their opium cultivation and production as to safeguard the the British revenue, and in exchange receive compensation or other concessions, 102, 103, 1562, 1563.
No agreement with Native States so to manage opium cultivation, 21,811–25.
Arrangements regarding opium, 876–81, 954–58.
Aggregate population of the opium-growing States about ten millions, 1547.
Policy of British Government, 21,833–39, 21,845–59, 21,863–66.
Bombay States refused to accept the 2-tola rule, 26,149, 26,220.
Introduction of a system of control and excise would bring consumption within narrower limits, 27,039–48, 27,059–61.
Agreements with States, under Bombay, respecting opium, ii, 352.
Quantity imported, 1883–84 to 1892–93, ii, 353.
Arrangements regarding opium, ii 354–70.
Abstracts of evidence of witnesses not examined, iv. 417–24.
Principles of interference, iv. 495.
History of our opium dealings, iv. 496.

—— CHARITY CESS:
Charitable institutions and works of public utility maintained by cesses levied on each chest of opium, 21,872.
Rs. ¼ per chest taken at all scales except at Indore, 22,098–103, 22,119–25.
Dispensaries would have to be shut up if China trade failed, 22,127.

—— COMPENSATION:
Would be a matter of bargaining with the States, 2079.
Impossible to estimate loss to cultivators, 2080.
Compensation for loss of revenue 2524–26, 5774, 16,031.
Compensation in full would not allay dissatisfaction in the Native States, 16,225, 21,249, i. 143.
Government ought to pay compensation, not for a number of years only, but for ever, 16,415.
Compensation would have to be paid, 18,171, 24,813.
Estimated amount claimable by the States, 20,434.
Amount required cannot easily be ascertained, 21,816.
Claim should be made by States for loss of revenue and loss of profit to cultivators and traders, 21,872.
Impossible to estimate accurately amount required, 22,105, 22,118.
States dissatisfied with compensation for partial prohibition in 1878, 24,413.
Claimable by Bombay States for loss of revenue and imports, loss of internal revenue, loss of prestige, cost of preventive establishments, 26,153.
Inadequate return for abrogation of privilege, and loss of revenue, 26,430.

—— CONCESSIONS:
Compensation for loss of duty and other concessions. 102, 103, 1562, 1563.
Have become obsolete, 1538.
No money compensation now paid, 1564–67.

—— CONSUMPTION:
Exceptional in Gwalior, Samthar, and Rewa, 22,113.
Quantities issued in the Bombay States, 1883–84 to 1892–93, 26,153.

—— CULTIVATION:
Cultivation not interfered with by British Government, 1532, 21,811, 21,825.
Has not attempted to extend cultivation, 1533–35.
Perfectly free in every Native State, 1536–38.
Poppy largely grown in Indore, Gwalior, Bhopal, &c., 1546.
No treaty authorising interference, 1552.
Expense of irrigation tanks makes poppy land so valuable as to be unusable for a cheap crop, 1581.
Prohibition would make the people disloyal, 1611, 1612.
Regulation of poppy cultivation, 2498–507.
British Government cannot prohibit cultivation, 2709.

NATIVE STATES, CULTIVATION—*continued.*
Area under poppy cultivation, 21,869; assessment of land revenue, *ib.*
Average yield of poppy milk, *ib.*
Methods of agriculture and manufacture, *ib.*
Cultivators do not as a rule keep back opium; have to account for produce, 22,081.
Feeling decidedly in favour of opium cultivation, 27,469.

—— CUSTOMS LINE:
Abolished by treaty, 22,106.

—— DUTY:
System of taxing opium, 1530, 1531.

—— EXPORT:
Opium sent direct under pass to Bombay, 1531.
British Government could prohibit export, 1541–43 1551; would ruin the States, cultivators, and merchants, 1544, 1548.
System in force, 21,871.

—— LAND REVENUE:
Rates on opium land reduced largely in 1882–83, 1533.
Fixed settlement for a term of years in most States, 22,145.
Rate on irrigated land assessed on understanding that poppy most valuable crop grown on it, 22,147.
Prohibition of poppy cultivation would necessitate reduction of rates, 22,159.

—— PRICE:
Opium not so good as excisé in some States, but cheaper, 12,934.
Depends chiefly on the prices in China, 22,069–73.
Retail price in the Native States, 22,074–78.

—— PROHIBITION:
Could not be enforced in Native States, 872, 16,225.
Prohibition would involve gravest political danger, 908.
Would be a capital political error to deprive States of their revenue, 1165.
Prohibition of export would make the States bankrupt, 1544, 1548, 1549; and disloyal, 1544.
Would be a most tyrranous act, 1551.
Would be resented by the general body of the population, 1609, 1611, 1612.
Prevention of smuggling would become impossible, 1610.
Prohibition would inflict heavy loss, 2058.
Attempted prohibition by compulsion would lead to war, 2936.
Interference with growth of opium would result in danger to the empire, 5176, 5231.
Would be considerable difficulty in abolishing cultivation, 12,940.
Prohibition would be unjust to Native States, 16,210.
Impossible to prevent cultivation, 17,231.
Great difficulty anticipated in inducing States to accept prohibition, 18,171.
Not desired by the people; would interfere with their domestic lives; would remain simply as a dead letter, 18,615.
Grumbling against prohibition very common, 18,725–31.
People of Jeypore would be thankful if authorities closed the shops, 20,345–51.
Compensation would not induce States to prohibit poppy, 21,620, 21,644, 21,682.
Prohibition except for medical use is impracticable, 21,814.
Amount of supervision and interference required would cause great friction, *ib.*
Would involve loss of revenue to Native States and cultivators; would ruin a number of merchants, 21,815.
Would be opposed to spirit of our treaties of friendship, *ib.*
Would be an unjustifiable act of oppression, *ib.*
Would be unpopular, notwithstanding compensation, *ib.*
Smuggling would become prevalent if export prohibited, 21,816.

NATIVE STATES, PROHIBITION—*continued.*

Distinction can be drawn between prohibition of cultivation in the States, and of import through British territory, 21,855.
Prohibition in an independent Native State would be unjustifiable, 21,857.
No precedent for any such interference, 21,858.
States suspicious of interference in their affairs, 21,867.
Would constitute a political danger, 21,873, 26,258.
Prohibition of transit would be equally dangerous, 21,874.
Would entail heavy loss on the cultivators, 21,946.
People in a terrible state of mind regarding prohibition, *ib.*
Would be impolitic, 22,282; exceedingly difficult and dangerous, 22,283; would lead to corruption in subordinate medical service, 22,284.
Would be regarded by chiefs as unjustifiable to their own subjects, 22,699.
Prohibition could not be extended to the States, 22,763, 22,783, 22,797, 22,835, 22,856, 22,869, 22,898, 22,936, 23,204, 23,628, 23,660, 23,732, 23,780, 23,826*a*, 23,856, 23,878, 23,942, 23,952, 23,976, 23,984, 23,989, 24,016, 25,267, 26,149.
British Government would not be justified in preventing cultivation or export, 23,053.
Prohibition would excite lawlessness among criminal tribes, 23,208.
Arrangements regarding opium cannot justly be terminated, 23,564, 23,637.
Extremely difficult to extend prohibition to the larger States, 24,219, 24,238, 24,250, 24,280, 24,377.
Prohibition not desired, 24,365, 24,413, 24,428, 24,470.
Would be unjust and unfair, 24,454, 26,967, 26,970.
Arrangements regarding opium cannot be deviated from without consent of chiefs, 24,470, 24,498, 24,499, 24,514, 24,515, 24,555, 24,628.
Nothing but a large armed force could prevent cultivation and sale of opium, 24,577.
Hardship entailed on people in Native States where cultivation prohibited through increased price of poppy seed, 24,627, 24,660.
Cultivation could only be prevented in smaller states, 24,813.
Further restrictions would entail ruinous compensation, and would be neutralised by foreign illicit opium, *ib.*
Prohibition of sale of opium wholly impracticable, 24,910.
Present arrangements quite satisfactory; cannot be terminated without injustice, 24,970.
States would not voluntarily prohibit opium, 25,022, 25,104–7, 25,138.
Existing arrangements should not be interfered with, 25,225.
Prohibition would lead to political complications, 26,006.
Impossible to induce States to accept prohibition, 26,149.
Money would not compensate them for unpopularity incurred with their subjects, *ib.*
Impolitic and dangerous to interfere with existing engagements, 26,152, 27,037.
Would be regarded as breach of faith, 26,410, 26,430.
Difficult to extend prohibition to Native States, 27,735; difficult, if not impossible, v. 126.
Curtailment of supply would create dangerous discontent, 28,051*a*.
Impossible to interfere with agricultural operations, i. 143.
States could be compensated, but people would not be conciliated, *ib.*
Profit and loss through prohibition, iv. 497.

—— REVENUE:

Methods of raising revenue, 1539, 1540.
Revenue from opium, 2532, 2533.
Opium as a source of commercial income and State revenue, 18,607–9.
Revenue realised by the States from opium, 21,872.

—— SMUGGLING:

Smuggling of opium grown in the States, 967–69, 992.
Pass system prevents smuggling, 1538.
Great deal exists; preventive system not successful, 1553, 1554, 1590–93.
Prevention of smuggling would be impossible if opium prohibited, 1610.

NATIVE STATES, SMUGGLING—*continued.*

States cannot prevent smuggling themselves, 1568–70.
Would become prevalent if export prohibited, 21,816.
Expense of preventive force would be very great, *ib.*
Chiefs anxious to stop smuggling, 22,132.
Impossible to prevent smuggling if opium prohibited in British districts, 26,655.

—— TRADE:

Trade with China fluctuates largely; will probably revive, 1531, 1561, 1578.
Continued depression is causing much anxiety to native chiefs; serious danger of loss of revenue to the States and profits to cultivators, 1580.
System in force, 21,871.
Very fluctuating, but able to bear the pass duty, 22,070.
Profits curtailed through fall of prices in China, 22,115.

—— TRANSIT:

Transit duty, 101–3, 106, 107; concessions, 102, 103, 148–51.
Application for reduction of pass duty, 21,810, 21,820–22.
Pass duty amounts to about 120 per cent. of cost, 22,095.
*See also under the various States.*

NEPAL:

Poppy largely grown in the Terai, 5510, 5512.
Cultivation and smuggling would be increased by prohibition in Behar, 8500.
Smuggling impossible to prevent, 13,869–75, 15,451.
Smuggling could not be checked if cultivation in India prohibited, 19,650.

NIKHALIA:

Opium grown in Jawad and Nimbahera, 21,789.

NORTH-WEST PROVINCES AND OUDH:

Arrangements with Native States regarding opium, ii. 357.
History of the Opium Excise administration, v. 83.

—— CONSUMPTION:

Consumption of opium, 15,139–43, 19,102.
Consumption per head less than in England, 19,532, 19,614–18.
Consumption of preparations of opium in unlicensed places, ii. 392–97.
History of opium-smoking, v. 87–89.
Quantity of opium consumed, 1860–61 to 1892–93, v. 90–93.
Statistics of opium for North-West Provinces and Oudh, 1860–61 to 1892–93, v. 90.
Ditto North-West Provinces, 1860–61 to 1892–93, v. 91.
Ditto Oudh, 1860–61 to 1892–93, v. 92.
Ditto 1892–93 (by districts), v. 93.

—— CULTIVATION:

Natives would not cultivate poppy if advances stopped, 738.
Only a quarter of the area would be sown but for Government pressure, 16,540.
Stopped in five districts without protest by the ryots, *ib.*
Increase of area under poppy, 19,310.
Land revenue and value of opium crop in Gorakhpur District, 19,315.
Poppy cultivation, 19,457–74.
Total value of poppy crop, 19,539–41.
Poppy largely grown and facilities for illicit use great, i. 142.
Area under poppy and average out-turn, 1860–61 to 1892–93, v. 90–94.
Statement of profits of poppy cultivation, 1891–92, v. 94.
Poppy cultivation in the Rae Bareli district, v. 97–99.
Area under poppy and other crops, 1888–89 to 1892–93, v. 98.
Land revenue, rent, and value of poppy, 1888–89 to 1892–93, v. 99.
Opium cultivation in typical villages, *ib.*

North-West Provinces and Oudh—*continued.*

—— Minimum Vend Guarantee:

Condition omitted from licenses since October last, 13,686, 13,728–30.
Consequent increased traffic in illicit opium, 13,686, 13,829.

—— Possession:

Three tolas amount allowed by law, 13,787.

—— Price:

Retail price at licensed vendors' shops, 13,813–16.
In Burma and Lucknow compared, 14,186.

—— Prosecutions:

Smuggling very difficult to prevent, 19,103.
600 to 700 prosecutions in the year, *ib.*
Prosecutions for illicit possession and sale, 19,572.
Extremely difficult to adduce satisfactory proof, 19,573.
Severe sentences have no deterrent effect, *ib.*
Cases of illicit dealings in chandu and madak, 1892–93, v. 95, 96.

—— Revenue and Taxation:

Revenue derived from opium, 1860–61 to 1892–93, v. 90–92.
License fees and gain on excise opium, 1883–84 to 1892–93, v. 115.
Incidence of license fees per ser, 1891–92, v. 116.

—— Sale

Sales by licensed vendors have fallen off since minimum guarantee condition dropped, 13,686, 13,731–34.
Increase in illicit sales since minimum guarantee condition dropped, 13,686, 13,829.
Direct retail sale by the Government in Lucknow has largely increased, 13,686, 13,710–18, 13,731–34.
Retail sale by sub-treasuries, 19,574–87, 19,598–601, 19,608–13.
Arrangements for supply and sale of opium, ii. 348.
Number of shops, issues, and receipts, 1883–84 to 1892–93, ii. 349.

—— Shops:

Confidential circular as to opium dens, 1900–14, 1937, 1938, 2425–30, 2765, 2772–81, 2812–15, 2864–76, 19,590, 19,619–28.
Closing of licensed smoking shops followed by large increase of opium dens in Lucknow, 13,691, 13,705–9, 13,735–39, 13,743–45, 13,781–86, 13,804–9, 13,819–26, 14,465, 14,522, 14,577, 14,602, 15,517, 15,548, ii. 392–97.
Closing the chandu and madat smoking shops a mistake, 14,353.
Coolie runners took pipes to customers' houses after suppression of smoking shops, 16,563–67.
Reduction in number of smoking shops extremely beneficial; closing them altogether of doubtful utility, 19,120–23.
Shops in Meerut grouped in malarial districts, 19,528, 19,542.
Correspondence respecting smoking in unlicensed places, ii. 392–97.
Number of shops licensed, 1883–84 to 1892–93, ii. 349; 1876–77 to 1892–93, v. 90–92.

—— Smuggling:

Smuggling from Nepal would neutralise prohibition, 15,451.
Large preventive establishment would be necessary, 19,103.

## O.

Oats:

*See* Substitutes for Poppy.

Occasional Use:

Sometimes taken in winter only, 16,950, 16,991, 16,995, 17,020, 18,691.
Sometimes taken for rheumatism, in winter only, 17,778.
Many native soldiers take it occasionally for hard work or excessive cold, 18,698.
Camel drivers, people of the dessert, labouring classes, and villagers all take opium occasionally, 20,856, 20,861–64, 20,904.
30 or 35 per cent. of Rajputs are occasional consumers, 21,125, 21,443.
Occasional taking of small doses very common among the Sikhs, 21,959, 21,973.

Old Age:

Opium especially recommended for people over 40, 2593.
Improves digestion and keeps up vital powers, 3943, 3963.
People over 40 take opium as a sustainer, 4038.
Useful for old people suffering from chronic asthma, &c., 4194, 25,816.
Old people take opium to restore failing powers, 4281–88.
Elderly people do not as a rule take opium, 4283.
Necessary stimulant for advancing age, 5662.
Arrests natural decay after 50, 5738, 5742–49, 6117.
People after 50 take small doses to aid digestion, 6107, 6117, 6221.
Beneficial to persons over 40, 12,576, 12,849, 14,484, 14,485, 15,449, 15,498, 18,957.
Supposed to support declining strength in old age, 13,993, 13,994, 15,716.
Valuable when powers fail about fortieth year, 15,914.
Beneficial for aged persons, 16,018, 25,012, 25,100.
Generally used for preserving strength after 40, 16,523, 17,422.
Prevents diseases in old age, 17,621–23, 17,693.
Ninety per cent. take opium above 40, 17,721.
Injurious in old age, 17,947.
Useful for phlegmatic constitutions above 40 or 45, 18,294.
Small quantities taken in old age to keep up strength, 18,569.
Sustains the body, and prevents waste after middle age, 18,795.
Old people use opium as an aid to digestion, 18,916.
Old people take it to sustain their failing nerves, and as a preventive of cold, 18,928, 18,957, 18,960, 18,969, 19,083.
Elderly people take it as a protection against nervous exhaustion, 19,004, 19,011.
Old men take it to keep weak organs in good order, 19,214.
Habit often commenced late in life to sustain failing powers, 19,527.
Generally believed to do good after forty, 19,757, 19,780, 19,787, 19,820, 21,812, 21,870, 23,864.
Tends to prolong life when used after forty, 20,114.
Improves the general health in old age, 20,169.
Old people often kept going by opium alone, 20,269, 20,303.
Generally used in middle life for disease or weariness, 20,278.
Used after middle age as a restorative for failing powers, 20,421.
Habitually used by old men, 20,866–72, 21,920.
Most people take opium at decline of their age, 22,176.
Old people can keep their health without opium, 22,793, 22,799.
Recommended for very old people who have to labour, 22,915.
Keeps up strength of old and infirm persons, 23,062, 23,104.
Not considered injurious after 40, 23,117.
Men in declining age recommended to use opium, 23,261.
Old people with failing strength frequently resort to opium, 23,333, 23,348.
Moderate use after 40 like a prop to a falling house, 23,980, 23,998, 24,006.
Old men take opium to revive natural powers, 24,075.
Taken for medical purposes after forty, 24,494, 24,497.
Used to sustain failing powers after 45; excess rare, &c., 24,566.
Habit fairly common among people after 35 or 45, 24,987, 25,100, 25,143–49, 25,163, 25,236, 25,254, 25,395, 25,565.
Rarely used as a restorative among old men in Bombay, 25,995.
Produces greatest benefit when taken after forty, 26,023.
Many persons take opium in old age, 26,049.
Men advanced in age use opium with advantage, 27,421, 27,428, 27,461.
Checks progress of effects of age, 27,567, 27,597.

OLD AGE—*continued.*

Beneficial to old and infirm persons, 28,026, 28,047, 28,059.
Some old men take opium as a restorative, 28,086.
Men who take opium after 40 generally live long, 28,117.
5 to 10 per cent. take to opium when vital powers begin to fail, ii. 409, 415.
Opium acts like a prop to a tumbling house in old age, ii. 414.
Prevents wear and tear especially after 40, ii. 416.
People of advanced age use opium as a digestive, iv. 374.

OODEYPORE:

Return of opium passed the scales, 1878–79 to 1882–83, iv. 415–17.

OPIUM:

Excise compared with medical opium, 3195.
Analysis of various classes, 3341–73, 4213, ii. 405.
Quotations from Sanskrit text-books, 4456–72.
Liable to adulteration, 5035, 16,097, 18,894.
Used as a circulating medium in Assam, 5590, 5609, 5632–56; in China, ii. 443.
Mentioned in Sanskrit books of medicine, 5850–52.
Quotation from Ancient literature, 14,417.
Refined opium procured by boiling, 16,245–47.
Description of opium and its preparations, 20,323.
Increased in value by age, 21,292, 21,801–4, 21,869.
Method of testing quality, 25,041–57.
Antiquity of use proved by the "Makhzan," or Pharmacopœia of the Yunani School of Medicine, 26,775, 26,787.
Not mentioned in the Sanskrit standard medical works, Charak and Shushruta, 26,893.
Analysis of different varieties, ii. 405.
Quantity of alkaloids and extractive, ii. 406.
*See also* CHINESE, EGYPTIAN, EXCISE, MALWA, MEDICAL, PERSIAN, PROVISION, SHAN, TURKISH, and YUNNAN OPIUM, and PREPARATIONS OF OPIUM.

OPIUM ACTS:

Act No. XIII. of 1857, ii. 527–29.
Acts Nos. XXIII. of 1876 and VI. of 1877, iv. 456.
The Opium Act, 1878, ii. 531–36, iv. 458–69.

OPIUM ALKALOIDS:

Morphia, narcotine, and codeia manufactured from refuse opium, ii. 322.
Quantity manufactured, and sold in India and England, 1883–84 to 1892–93, ii. 330.
Quantity in different varieties of opium, ii. 406.

*See* MORPHIA, NARCOTINE.

OPIUM COMMISSION, 1883:

Report cited as to advantages of poppy cultivation, 10,796.
Specially inquired into grievances of the producers, 12,081, 12,082.
Recommendations, 12,122–41, 13,521–35.
Correspondence regarding recommendations, v. 1–72.

OPIUM DEPARTMENT:

Alleged oppression by Native subordinates, 2767, 2838–63, 11,953–66, 11,975–77, 11,982–98, 12,005–61, 12,079, 12,087, 12,142, 12,149, 12,163, 12,270–77, 12,335, 12,396–400, 12,406–54, 12,747, 12,768–74, 12,776, 13,040, 13,392–403, 13,697–99, 13,761–63, 13,969–71, 14,939–42, 14,934, 15,059–62, 15,068–90.
Supervision of cultivation in Benares, 2940–76, 2988–90, 2996–3020.
Petitions against agents for refusing licenses to cultivate, 3196.
System with respect to advances, 5519–34.
Regulation of quantity grown, 5571–76.
Efforts of subordinate officers to induce people to cultivate opium, 6276–80, 6305–13.
Agents have refused permission to grow opium, 8514.
Native underlings said to interfere with cultivators, 8521–31, 8547–50, 8767–69.
General compulsion would be impossible, 8787–90.
Petty corruption among Native subordinates, 10,849–53, 10,887–91, 10,910, 10,927–34.
European inspection a check on abuses, 10,850, 10,857–60.
Custom of providing supplies without payment, 10,899–903.

OPIUM DEPARTMENT—*continued.*

Native subordinates have uprooted other crops grown, in poppy land, 11,355, 11,366, 11,370–80.
System of dealing with opium cultivators pursued by subordinate officials, 11,431, 11,432.
Ryots have no means of approaching the higher officials, 11,449, 11,504–8, 11,654–56.
Too much meddling and interference with cultivators, 11,464, 11,465, 11,472.
Oppression by sub-opium agencies renders poppy cultivation unpopular and unprofitable, 11,709, 11,710, 11,713–85.
Villagers have no reticence in making complaints, 12,155, 12,156, 12,163.
System of cultivation under the Department, 12,187–340.
System of administration, Behar Opium Agency, 13,452–77, 13,508–647.
Popular expression that all work done for Government is "by order" gives rise to idea of compulsion, 14,802.
Pressure sometimes required to make men fulfil their contracts, 14,803.
Letter asking for extension of area under poppy, 15,696.
Pressure accountable for three-fourths of cultivation, 16,570, 16,630, 16,631.
Compulsion of cultivators absolutely impossible, 19,131, 19,537.
System of land settlement, 19,335–38.
Acts as an agricultural bank, 19,535.
Less corruption among minor officials in India than in England, 19,638.
Tenants fear extortion by subordinate employés, 19,780.
Difference between systems in Patna and Benares, i. 134.
Administration of the Department, ii. 319–39.
Subordinate Native Establishments, ii. 320.
Strength and annual cost, ii. 323, 324.
Arrangements for supply and sale of opium, ii. 347–54.
System under which excise opium and its preparations are sold in Bengal, ii. 426–35.
Correspondence regarding treatment of a poppy cultivator at Burai, in Behar, v. 140–42.
Results of inquiry into allegations of undue influence in respect to poppy cultivation, v. 354–61.

OPIUM DROSS:

Refuse of chandu after smoking; used by poor class of Chinese; practice very injurious, v. 149.

OPIUM SCALES:

Arrangements for levying transit duty, 963–69, 977.
Native States responsible for enforcement, 990, 991.
Jeypore opium taken to Indore or Ajmere, 20,204.
Meywar opium sent to the scale at Chitor, 20,504.
Pertabgarh to Mandsaur, 20,585.
Jhallawar opium weighed at Ujjain and Indore, 20,674.
Bundi opium goes through Indore to Bombay, 20,949.
Tonk opium passes the barrier at Ujjain or Indore, or at one of the minor scales in Central India, 21,228.
Dungarpur opium sent to Ahmedabad, 21,651.
Opium from Native States brought to scales, weighed and duty paid, 21,871.
Eight scales at convenient centres under Indore, 22,086.
Total export through the scales, 22,088–93.
Baroda opium passes through scale at Ahmedabad, 22,493, 22,514.
Scales maintained by the opium agents, ii. 347.
Opium brought to Ajmere scales, iv. 404.

*See also* PASS DUTY.

OPIUM SOTS, TENDENCY TO BECOME:

Irresistible tendency to increase the dose, 296.
No such thing as moderation in opium-taking, 297.
The term "moderate user" difficult to define, 404, 21,880.
Craving so terrible that it leads to increase, 629–32.
Opium cannot be taken in moderation; dose always increased, 645.
General tendency to gradual increase, 703.
Should be kept within bounds, 711.
Term "moderate" misapplied in reference to opium-smoking, 853.

Opium Sots, Tendency to become—*continued.*

Vast majority consume opium in moderation, 872, 898.
General rule, dose not increased, 1017.
Cases of excessive use quite exceptional, 1020.
Number not to be compared with that of drunkards in England, 1126–36.
Moderate use possible; danger of proceeding to excess, 1383, 1434–37.
No tendency to increase the dose in majority of cases, 1601.
Sots exceptional among opium smokers, 1604.
Statement that smokers must continually increase the dose is untrue, 1631.
Statement that tendency is ever to increase disbelieved, 1637.
Generally increased; drug very seductive, 1641, 1653.
Habit not likely to degenerate into a vice, 1735.
Smokers nearly all go to excess, 1987, 1988.
Increased as effects of disease become more severe, 2153.
Tendency to increase the dose, 2354, 2593, 3044, 3876–80, 4140–44, 4148, 4257–60, 4393–96, 5832, 5878, 8604, 8640, 8855, 10,495, 11,815, 11,870, 16,549, 18,958, 19,001, 19,066, 19,857, 20,046, 20,079, 20,109, 20,135, 20,141, 20,340, 23,688, 27,202, 27,323, iv. 378.
Cases of immoderate use rare, 3183, 6191. 6219, 13,841, 14,303, 14,354, 18,795, 23,018, 24,906, 25,322, 25,341, 26,794, 27,568, 27,570.
Vast majority of Indian opium-eaters moderate, 3401–5.
Opium sots usually persons of weak will, 3410, 3414, 3427.
Dose slightly increased as people get older, 3649, 3650.
Tendency to increase the dose exceptional, 3778.
Impossible to keep to small dose, 4287, 4362–67.
Craving for the drug causes agony, 4290.
Tendency to take larger doses very exceptional, 4570, 4571.
Majority take fixed daily dose for years without increasing it, 4707.
Majority of consumers moderate, 5240–41.
Four-fifths of the consumers use opium to excess, 9043, 9092.
Few use opium to excess,—and in towns only, 6296.
Excessive use almost unknown among Madrasis, 6743.
90 per cent. of consumers take opium to excess, [*i.e.* habitually], 11,811, 13,091.
Two grains or more constitute excess, 11,812.
Danger of proceeding to excess, 12,807.
Habitual consumers prostrated if unable to get their usual dose, 12,901, 12,940–43.
Invariable tendency to increase, 13,039, 23,436, 23,457, 23,462.
Feeling of weakness comes on at time for dose, 13,668–73.
Tendency to excess slight, 13,885; not invariable, 13,995.
Very few cases of injury from excess, 14,303.
Tendency towards gradual increase, 14,688, 23,495.
Gross fallacy to imagine that abuse necessarily follows use, 15,912.
Few persons take more than agrees with them, 16,073.
No general tendency to increase, 16,692.
After five or 10 years' moderate use a man becomes incapable of work until he has had his dose, 16,775.
Consumers never stop at moderate quantities, 16,805.
Tendency to increase not invariable, 16,902, 17,185–92, 19,033.
Tendency to increase not universal, 17,348.
Excessive consumers not one in a thousand in the Punjab, 17,366.
Sometimes taken for rheumatism, in winter only, 17,778.
Only those who take opium for sensual gratification increase the dose, 18,056.
People who use it as medicine do not increase, 18,302.
One-fourth of consumers use opium medicinally, 18,439.
Sometimes taken in winter, not in summer, 18,691.
Arbitrary standard between use and abuse, 19,189, 19,195, 19,210.
Ordinary moderate consumer does not increase as alleged, 19,228.
Tendency to increase not constant, 19,427.
Tendency to increase to a certain point, 19,529.
Generally speaking, consumer does not increase, 19,749.

Opium Sots, Tendency to become—*continued.*

Constant tendency to increase, 19,885, 19,893.
Strong tendency to increase, 19,906, 19,908.
No craving to increase the dose felt, 20,168.
Excessive use diminishing, 20,176.
Tendency is to increase, but less liable to abuse than spirits or bhang, 20,274.
If not taken at usual hour, consumer becomes sick, 20,331–33, 23,359, 23,382.
Not usually increased after first year or two, 21,414.
Consumers suffer great pain if they do not increase it, 21,530.
Not the slightest tendency to increase, 21,812.
No evidence of general opium debauchery, 21,870.
No danger of increase, 21,924.
Large majority do not increase, 22,064, 24,127.
Excessive consumption rare in comparison with spirit-drinking, 22,360.
Excessive consumers one per thousand, 22,385.
No ever-increasing tendency to increase, 22,579.
Missing usual dose produces inconvenience, 22,647.
Less than one-eighth of consumers take enough to affect health, 22,692.
One or two in a thousand go to excess, 22,759.
Two or three per cent. of consumers take opium in excess, 22,878.
Necessity of life to habitual consumers, 22,909.
Tendency to increase not so strong as in case of alcohol, 22,936, ii. 411.
Only one per cent. of consumers go to excess, 23,184, 24,518.
Doubtful whether moderate use exists, 23,523.
Takes most powerful hold of victims; must be taken with great regularity, 24,121.
When the hour comes the afimi must have his opium or lose his life, 24,352.
Opium essential to habitual users, 24,498.
Opium enslaves its devotee to a certain extent, 24,977.
Consumers usually adhere to small quantity for years, 25,373. 25,399.
Habitual users unfit for anything until they get their dose, 25,513, 25,568, 25,583.
Habit does not allow of moderation; only limit want of means, 25,522, 25,546.
Tendency to increase; seldom taken to excess, 25,583.
Moderate use apt to run into abuse, 25,739.
Occasionally taken in excessive quantity; people generally do not increase the dose, 25,812.
Explanation of "moderate use of opium," 25,868.
Gradually increased as system gets used to drug, 25,960.
Once formed, user must have his allowance, 26,286.
Many consumers keep to a small quantity for years, 26,479.
Moderate use often, if not always, leads to excess, 26,518.
Moderate use a luxury to some, a necessity to others, 26,612, i. 140.
Causes a craving for the drug when usual time of dose arrives, 26,711, 27,387.
So-called "moderate" dose would kill half-a-dozen non-users, 27,282.
Moderation leads to excess in 90 per cent. of cases, *ib.*, 27,339.
Less than one per 1,000 excessive users, 27,668.
Difficult to draw line between moderation and excess, 27,830.
Large majority of consumers ultimately go to excess, 27,832.
Consumers suffer if opium not taken at regular time, 28,038.
Tendency to gradually increase the dose and decrease the intervals, ii. 414.
Often not increased at all, ii. 436, v. 150.
Tendency to lead to excessive use, iv. 377.
Abuse harmful, but not common, iv. 454.
Chinese recognise a stage called *yin*, or insatiable craving; reached by very few, v. 149.
Opinions on moderation and tendency to increase, collected in Straits Settlements and Hong Kong, v. 154–209 (pars. 5 and 6); in China, v. 212–342 (par. 6).

*See also* Prevalence of Habit.

Opium Test:

Watching supposed confirmed consumers for 24 hours for nervous depression that follows deprivation, 27,511.

OPIUM *v.* ALCOHOL:

Comparison between effects of opium and alcohol, 65–70, 145.
Opium takes incomparably greater hold on its victim than alcohol, 347, 856.
Opium far worse than alcohol, 423.
No worse than wine in France or beer in Germany, 872.
Opium-eaters less injurious to society than drunkards, *ib.*, 26,518, 26,677, 26,715, 27,696, iv. 378.
Opium much more beneficial than alcohol, 1006, 1021–23.
Moderate use more harmless than that of alcohol, 1126–31.
Not so harmful as alcohol habit in England, 1174–77, 1181.
Opium sot does not make himself a nuisance like the drunkard, 1388.
Evil effects of alcohol in England much worse than of opium in the East, 1486, ii. 317.
Alcohol a thousand times worse than opium, 1560.
Opium more injurious personally; alcohol socially, 1667, 1668.
Alcohol more injurious than opium, 1728, 22,844, 22,850, 24,586, 24,595, 28,090.
Opium far more detrimental morally than alcohol, 1896.
Opium worse morally and physically than alcohol, 1981.
Alcohol worse than opium 2039, 9177, 9178, 11,705, 16,713, 16,810, 18,326, 22,923, 23,344, 26,243, iv. 375.
Drinking creates more disorder than opium habit, 2297.
Opium less hurtful than ganja or alcohol, 3183.
No degeneration of organs as seen in case of alcohol, 3744.
Opium decidedly less injurious, 3813, 3814, 4212, 26,243, 26,715.
Not to be compared with stimulating effects of alcohol, 3823.
Alcohol much worse than opium, 4003–8, 8849–54, 13,846.
Opium not so mischievous as European alcohol, 4608, 4609, 27,908.
Opium less pernicious than alcohol, 5243, 22,765.
Much more evil done by alcohol than by opium, 5472.
Consumers of alcohol always noisy and quarrelsome, 5506.
Never produces injurious results comparable to use of spirits by European working classes, 5596.
Alcohol stimulates; opium enfeebles and enervates, 5925–28.
Alcohol infinitely worse than opium, 6377–80.
Alcohol works hundred-fold greater mischief than opium, 7424.
Opium incomparably less injurious than alcohol, 8666, 14,796, 26,804.
Alcohol much greater evil than opium, 8676–78, 8706–9, 10,980, 20,859.
Greater individual evil than alcohol, 9443.
Alcohol undoubtedly produces worse effects than opium, 9708, 22,682.
Dangers of alcohol much greater than those of opium, 11,877.
Alcohol far more pernicious than opium, 12,579.
Alcohol preferable to opium in its moral effects, 14,570, 14,647.
Opium more favourably regarded than alcohol, 16,018, 16,435.
Not so harmful as ganja or alcohol, 17,297.
Alcohol more injurious than opium, 17,929, 22,844, 22,850, 24,586, 24,595, 26,715, 26,758, 28,090.
Alcohol in England beyond all measure worse than opium in India, 18,145.
Alcohol beyond all measure a greater evil than opium, 18,145, 18,173–78.
Alcohol incomparably more dangerous than opium, 18,218.
Far less hurtful than hemp drugs or alcohol, 18,792.
Opium habit is bad; alcohol worse, 18,819, 18,849.
Less insidious than alcohol, 19,254.
Opium not recommended, but better for natives than alcohol, 19,268–71.
Temperate use of opium like that of alcohol, 19,395.
Not nearly so bad as immoderate drinking, 20,170.
Alcohol has done fearful mischief in Bengal, 20,264.
Difficult to compare effects of opium and alcohol, 21,298.
Depends on individual tolerance, 21,301.

OPIUM *v.* ALCOHOL—*continued.*

Less damage by opium seen in India in 20 years, than from alcohol in English towns in a month, 21,413*a*.
Alcohol more likely to lead to excess than opium, 21,979.
Alcohol a greater curse among mill-workers, 22,800.
Excessive use of opium less injurious than of alcohol, 22,850, 25,908.
Opium-consumers harder workers and better behaved than liquor drinkers, 23,303.
Excessive consumption of alcohol or opium is bad, 23,438.
Enslaves its victims more quickly and completely than alcohol, 23,457.
Alcohol worst, next ganja, then bhang and opium, 23,618.
Alcohol causes more damage to health than opium, 23,691, 23,729, 23,741, 23,841.
Opium least injurious of all intoxicants, 23,920.
Effect not so bad as that of liquor or other drugs, 24,013.
Comparison of alcohol, ganja, tobacco, bhang, with opium, 24,124, 24,131–33, 24,187, 24,327.
Does not lead to immorality like ganja or alcohol, 24,257.
Craving greater than in case of ganja or alcohol, 24,327.
Abuse is certainly bad, but not worse than alcohol; moderate use better than alcohol, 24,362, 24,371, 24,389, 24,410, 24,543.
Comparison of opium with other intoxicants, 24,622, 24,625.
By no means so serious as effects of alcohol, 24,678, 24,740.
Drinking more dangerous than opium-eating, 24,692–94, 24,701, 24,778.
Injury caused by opium cannot be compared with effects of alcohol, 24,857.
"Alcohol puts a man in the gutter; opium puts him "in a dream," 24,867.
Alcohol works more ruin and misery than opium, 24,905.
Alcohol much more potent source of evil than opium, 25,007, 25,128.
Temptation to excess stronger than with opium, 25,009.
Madak-smoking probably worse vice than ganja or alcohol, 25,300.
More easily controlled, and abandoned, than hemp or alcohol, 25,412.
Far less injurious than alcohol or hemp, *ib.*
Even the worst opium den less objectionable than a liquor tavern, 25,583.
Consequences as serious as those of alcohol, 25,729, 25,737.
Excessive use not so dangerous as that of alcohol, 25,869, 25,890.
Abuse not so bad as abuse of spirits, bhang, &c., 25,902.
Does not lead to such serious consequences as alcohol, 25,958–61, 25,964, 25,989, 26,003, 26,042, 27,139.
Effects similar in moderation; alcohol much more injurious in excess, 26,025, 26,062, 26,615, 26,638.
Opium destroys the system, but not so rapidly as alcohol, 26,124.
Opium does not make men senseless or violent like alcohol, 26,322–27.
No more injurious than beer in England, 26,967.
No worse than taking beer or whisky, 27,449.
Opium does not bring on sorrow and suffering like alcohol, 27,732.
Influence more seductive than that of alcohol, 27,516, 27,554, 28,174, 28,187–92, 28,221–24.
Alcoholic drinks deprive a man of self-control; ganja of his sense; but opium takes his life-blood, 27,833, 27,863–66.
Alcohol infinitely greater curse than opium-smoking in its worst form, 28,018–22.
Extravagant use bad; not one-tenth so bad as liquor, 28,026.
Opium sot much less harmful than the drunkard, i. 142.
No greater evil than proportionate indulgence in liquor, i. 145.
Consequences far less appalling than those of drink, ii. 316.
Degredation and depravity caused by abuse of opium much less than by alcohol in England, ii. 411, 437.
Comparative effects of opium, ganja, and alcohol, ii. 415, 417.

OPIUM *v.* ALCOHOL—*continued.*

Opium-eaters become personally dirty, but not indecent like alcohol or ganja-users, iv. 380.
Substitution of opium for alcohol would do infinite good, iv. 506.
Weight of evidence overwhelmingly against alcohol, v. 150.
Comparison of effects of opium and alcohol in the Straits Settlements and Hong Kong, v, 154–208 (par. 8); in China, v. 213–342 (par. 8).

OPIUM WATER:

*See* AMAL PANI, KASUMBHA, POST.

ORISSA:

Consumption of opium greatly increased during famine of 1854, 730.
Consumption of opium, 4298–303, 4487–90, 4537–40, 4606.
75 per cent. of people in Balasore use opium, 10,693.
Consumption of opium in Balasore, i. 145.

OUDH:

Consumption of opium at Lucknow, 13,682, 13,683; generally, 14,350, 19,102.
Extent of poppy cultivation in Lucknow district, 13,693.
Average amount of advances for past five years in Sultanpur, 14,362, 14,363.
Area diminishing in Sultanpur, 14,357–59, 14,366, 14,367, 14,381.
No compulsion exercised by Government, 14,360, 14,361.
System of settling the lands, 14,404–6, 14,442–48, 14,468–74, 14,488.
Opium not taken in Oudh until 50 years ago, 14,744–53, 14,758.
Use of opium among agricultural population moderate, 14,891, 14,905.
25 per cent. in villages; more in towns, 14,893.
Opium a staple crop in Oudh in 1550, 14,991.

PALITANA STATE:

Consumption of opium, 24,201, 24,209–12.

*See also* NATIVE STATES.

PANS:

Known as a criminal class, 4497; seldom take opium, 4498, 4545, 4546, 4631.

PARSIS:

A few eat opium; drinking not common, 22,733.
Habit regarded with indifference, 22,738.
Not favourable to opium as a body, 22,740.
Practice of dosing infants not common among Parsis, 24,762–66; less common than 20 years ago, 25,819.
Very few eat opium, 25,883.
Only one Parsi found among 800 smokers, 27,696.

PASS DUTY

Duty paid by Native States, 101–3, 106.
Abolished in Central India, 1540.
Malwa transit duty system, 2527.
Should be abolished by British Government, 24,628, 24,648.
Bombay pass duty on Malwa opium, 1880–81 to 1893–94, ii. 342.
Rates levied since 1862, *ib.*, 347.
Paid at Indore for Malwa opium consigned to Madras, ii. 351.
Origin of the Malwa system, ii. 371.

*See* MALWA SYSTEM.

PATHANS:

Take charas more than opium, 17,576, 17,580–83.

PATIALA STATE:

Consumption of opium, 16,218, v. 124.
Chandu and madak prohibited, 16,220, 16,243, 16,244.
Revenue from opium, 16,227–29.
Cultivation is free, 16,230.
People would object to modified prohibition, 16,258.
Arrangements regarding opium, v. 123.
Imports from Umballa and Malwa, v. 124.

PETITIONS:

Signatures to petition of the Bombay Medical Anti-Opium Alliance, 241, 245, 1922, 25,598–649, 25,670–715, 25,749–68, 25,772–93, 25,841*a*–49, 25,873, 25,876, 25,965–81, 26,071–118, 26,436, 27,092*b*, 27,380, 27,711–19, iv. 481–84.
Three petitions from 1,000 Chinese Christians praying for suppression of the Indian trade, 677–83.
From Chinese community in Rangoon in favour of prohibition of opium, 8343–63; translation of petition, ii. 525.

PETITIONS—*continued.*

Against prohibition or reduction of poppy cultivation, 13,000.
Translation of petitions to be relieved from poppy-growing, 19,093.
From residents of Umballa in favour of continuance of present system, *ib.*
From Zaildars, &c. in the Ferozepur district for suppression of adulteration by excise opium contractors, *ib.*
Against compulsory poppy-growing, 20,444.
In favour of use of opium for disease, and of cultivation, *ib.*
From residents of Ajmere, praying that opium traffic be not discontinued, 23,551.
From Chinese residents in Moulmein praying for further restrictions on sale of opium, 24,846.
From opium-consumers in Bombay praying permission to appear before the Commission, 24,848.
Petition from opium-consumers in Poona not genuine, 26,160–62, 26,277, 26,278.
Petition *bonâ fide*; only man who refused to sign was a Government servant, 26,487–93.
Seventy-three names, of which only three were genuine signatures, 26,659–69.
Petition from Bombay opium-smokers in favour of practice, iv. 373.

*See also* MEMORIALS.

PHARMACY ACT:

Should be extended to India, 2537.

PHILIPPINE ISLANDS:

Indian opium imported, 1889–90 to 1893–94, ii. 335, 391.

PHYSICAL EFFECTS:

Opium produces extreme emaciation; causes susceptibility to intercurrent diseases, 225.
No special organic disease found in opium smokers, 257, 3744.
Powers of endurance greatly impaired by use of opium, 301.
Smoking interferes with the nutritive system, seriously affects the nervous and generative systems, and generally lowers vitality, 389.
A smoker can be told directly by his eyes, 633.
People far worse physically wherever opium grown and used, 670.
Effects of excessive smoking noticed in consumer's appearance, 858, 1382.
Statistics show no deaths from opium, 1058, 1414, 1389, 1419–20.
Miserable condition of some smokers put down to opium, but really due to disease, 1502, 1727, 1747.
Physical condition improved, not deteriorated, 1637.
Excessive users suffer from diarrhœa and colic, 1683.
Constitutions rarely ruined simply by opium, 1727.
A great many miserable emaciated creatures were strong, well, and healthy when they commenced the habit, 1890.
Report of a case in the "Bombay Guardian" cited, 1892.
Fanciful calculations as to poisonous character of opium would apply to salt or other similar commodities, 1896-900.
Opium a predisposing cause of death, 1919, 1920, 1952–55.
Smokers cannot be told from non-smokers, 2026.
Weakens the constitution; wrecks 40 out of 50 confirmed smokers, 2256.
Extreme emaciation most noticeable, 2593, 2954.
Indulgence in a large measure paralyses the body and clouds the brain, 2766.
Opium-eaters or drinkers do not suffer from any particular disease, but grow weak, 3175.
Opium drunkards are pitiable objects, 3394–98.
Death from diarrhœa due to opium, 3481–85.
Death from opium alone, without disease, unknown, 3660.
Mischievous effects confined to sot, drunkard, and excessive user, 3684–88.
No such degeneration of any organ as seen in case of alcohol, 3744.
Tendency to deteriorate the health, 3795.
Excess causes jaundice, enlarged liver, dysentery, and diarrhœa, 4033-36.
Underfed people lose flesh, 4200–4.
Emaciation speedily manifested, 4286.

PHYSICAL EFFECTS—*continued.*

Dr. Russell's views, 4308–13.
Opium-eaters may be known from effect on eye, 4409.
Smoking produces emaciation, but eating does not, 4671.
Abuse brings on debility, nervous tremour, emaciation, indigestion, and fatal diarrhœa, 4715.
Details of cases, 4718.
Emaciation disappears rapidly after drug stopped, 5173.
Opium-eaters predisposed to cold, bronchitis, diarrhœa, dysentery, and dyspepsia, 5833, 5835.
Consumers succumb to trivial complaints, 5833, 5878–83, ii. 551.
Consumers distinguishable by their emaciated features, sunken eyes, and lethargy, 5913.
Immoderate use gives rise to fatal obstruction of the bowels and retention of urine; or may lead to opposite conditions of diarrhœa, dysentery, and eneuresis, 6330.
No specially morbid conditions due to opium; brings on intractable diarrhœa which occasionally causes death, 6694–99.
Depend on amount consumed, 6734, 6735, 6743.
Liability to attacks of inter-current diseases, 6803, 6814–17.
Effects serious in combination with disease, 6808, 6809, 21,298.
Opium saps the physical strength, 6947–56.
Excess causes emaciation, 7421, 7465–71.
Appetite fails; daily waste not replenished, 7484–89.
Habitual smokers thin, emaciated and haggard-looking, 7747.
Dysentery very common among excessive opium smokers, 7793–95, 7842–55.
Smokers lose their strength and become shrivelled up, 7863, 7870, 7874.
Habit leads to physical wreck, 7983–88, 13,996, 14,037.
Emaciation noticeable among moderate consumers, if underfed, 8890–908.
Excessive consumers become pale, indolent, and emaciated, 9042, 9391.
Produces weakness in body and mind, 9129, 9186.
Produces emaciation, torpitude and timidity, 9323.
Opium-eaters invariably recognisable, 9321, 9355–65, 13,203.
Opium-eaters appear like mere skeletons, 9391, 9426–30, 9457, 9458, 9480–84.
Effects of opium not apparent on medical examination, 9764, 9772.
Opium-eaters lose energy bodily as well as mental, 9847, 9860–67, 9926.
An opium smoker can be told by his face, 9880, 16,009, 27,597.
Habit produces weakness, 10,496.
Habit is debilitating; consumers succumb to disease sooner than others, 10,614, 10,629–33, 18,736.
Excessive smoking reduces consumers to a wretched condition, 10,979, 10,930–96.
Excessive consumers who are badly nourished become very lean and pale, 11,684, 11,821, 14,456, 14,460, 22,496, 22,579.
Undermines the nervous power of the system and deranges the internal organs, 11,816.
Excessive use attended with lassitude and disorder of the bowels, 11,889–91, 24,124, 24,184.
Excess does not produce any organic disease, 12,498, 19,361, 19,438, 22,025, 23,793, 24,184, 24,679, 24,722, 24,741, 24,778, 24,779, 25,296, 25,332, 25,909, 25,961, 26,058, 26,062, 26,616, 26,676, 27,140.
Causes emaciation, feebleness, loss of sleep and appetite, dysentery and diarrhœa, 12,567, 12,572, 12,608-10.
Effects of opium habit on men, women, and children, 12,659.
Injurious results apparent in 80 per cent. of cases, 12,660.
Debilitating under 40 unless consumer inclined to obesity, 12,849.
Consumers become ugly and thin; weak in mind, as well as body, 13,024.
Causes prostration, emaciation, and impaired digestive organs, 13,099, 13,102.
Habitual consumers can be told by their appearance, 13,099, 14,668, 16,748, 18,255, 18,266, 19,997 20,002, 21,333, 24,327.
Has a bad effect on digestion and health generally, 13,277–88.
Dries up the entire system, 13,379.

PHYSICAL EFFECTS—*continued.*

Excessive use produces lassitude, 13,939; if unaccompanied by nourishing food, produces dryness and weakness of the brain 13,978; wrecks the constitution, 13,996, 14,037; produces emaciation, gastric disorder, &c., 14,226; disorders the stomach, affects the secretions of the liver, 14,238–45; affects the physical and intellectual condition, 14,414, 26,407; produces paralysis, violent colic, congestion of the brain, and vitiation of the blood, 14,663–67; produces listlessness, 16,846.
Habit results in physical deterioration, 14,512, 14,623, 15,453.
Excessive consumers are miserable-looking and emaciated, 14,963, 18,736.
Young men of 16 or 20 become consumptive, 15,099.
Produces severe constipation, lowers circulation, and impairs functions of important organs, 15,150.
Excessive use injures the sight, 15,468.
Opium drunkards generally very thin and weakly, 15,991–96.
Stunts development among young consumers, 16,219.
Produces emaciation and debilitation; victims commonly die of diarrhœa induced by its use, 16,551, 16,598.
Injury depends upon feeding, 16,552, 16,553.
All break down ultimately, 16,552–55.
Smokers haggard, lean, and pale; like maniacs, 16,686.
A large proportion of smokers are emaciated, 16,716.
Opium smokers become mere skeletons in a short time, 16,776.
Opium-eaters cannot possibly be told by their looks, 16,849, 21,991, 21,999.
Produces no functional disorders in small doses, 16,871.
Medical description of ill-effects, 16,902.
Mortality from pneumonia high among opium-eaters, 17,297, 17,299.
Brings on emaciation, loss of appetite and energy, 17,616.
Habitual consumers suffer from purgation, 18,027.
If a consumer bathes he becomes ill, 18,064.
Habit leads to physical ruin in 15 to 25 per cent. of cases, 18,095, 18,096.
Causing the physical ruin of people of India, 18,210, 18,219.
Consumers become emaciated, lose muscular power, and become debilitated, 18,355.
Excessive opium-eaters are deplorable objects; succumb to trivial ailments, but are free from organic disease, 18,736.
Relation of opium habit to spleen enlargement, 18,749, 18,774.
Habitual use is very injurious; shortens life, upsets digestion, and weakens nervous system, 18,959.
Habitual use makes a man pale, lean, and emaciated; makes him stupid; impairs his powers of hearing and vision, 19,043,
Causes hebetude of mind, defective vision and irregular action of the bowels, 19,194.
First effect on vision is to improve it, 19,208.
Excessive consumers very thin, susceptible of cold, and afraid of bathing, 19,402, 19,419, 19,423.
Excessive consumers show extreme emaciation; no pathological changes, 19,438.
Excessive use brings on dryness of the heart, &c., 19,777.
Impairs appetite and digestion, leads to congestion, constipation, and diarrhœa, 19,907.
Consumers usually have disease independent of opium, 20,136.
Difficult to distinguish effects of opium and disease for which taken, 20,317.
Produces very little, if any, disease, 21,030.
General effects, tendency towards emaciation, 21,305.
Statements of consumers that they are not suffering probably erroneous, 21,309–16.
Alcohol in conjunction with opium quickly breaks down consumer, 21,416.
Consumers are dried up, 21,506.
Chandu and madak smokers show signs of deterioration, 21,655.
Excessive use produces emaciation; consumers thin, dried up and stupid, 22,023.
Excessive use accompanied by poverty produces deterioration, 22,745.
Lowers general health by diminution of secretions, 22,924.
Opium wrecks generally suffer from other habits and disease, *ib.*

PHYSICAL EFFECTS—*continued.*

Excessive use enervates the constitution, 22,758, 22,869.
Consumers generally weaker than other people, 22,898.
Habit is a real evil, causes emaciation, unfitness for work, &c., 23,309.
Smokers become very unhealthy and weak, 23,382.
Causes loss of strength and emaciation, 23,429.
Habit causes bleeding at the nose, asthma, impotency, diarrhœa, &c., 23,457.
Habit causes "opium-eaters' asthma" and weakness. 23,491*a*–93.
Causes waste, and dries up the system, 23,496.
Consumers invariably stouter and stronger before commencement, *ib.*, 23,503–6.
Entirely breaks down the constitution, 23,683, 23,702.
Habitual consumption produces general pallor, emaciation, weakness, premature old age; it shortens life, 23,791.
Excess brings on physical and mental debility, drowsiness, &c., 23,875.
Excessive use produces effeminacy of appearance and dulness, 24,013, 24,030.
Intemperate use causes deterioration, emaciation, gastric disorders, and shortens life, 24,075, 24,085.
Opium dries up the body and impairs memory 24,595.
Excessive use causes loss of appetite, disordered digestion, emaciation, diarrhœa, and dropsy, 24,675, 24,905.
Worst effects seen are obstinate constipation, alternating with diarrhœa and emaciation, 24,740.
Excessive use produces narcosis and stupor, but no organic disease or pathological change, 24,778.
Madak smoking causes emaciation, 25,293, 28,064, 28,077, 28,134.
Consumers cannot be told by their appearance, 25,348.
Emaciation usually due to ganja in conjunction with opium, 25,351.
Death through pneumonia and immoderate use of opium, 25,369.
Chances of recovery not affected by moderate consumption, 25,380.
Excessive chandu or madak smokers a miserable class with emaciated bodies and depraved intellect, 25,395.
Excessive use produces extreme constipation, sleepiness, and apathy, 25,399; causes bowel disorders, 25,509; interferes with digestion, produces languor, lassitude, and wasting, 25,657; produces emaciation, inability to work, &c., 25,954.
Excessive smoking impairs the sight, and produces blood-shot eyes, 25,510.
Large doses check secretions, without producing degenerative changes, 25,960.
Very difficult to distinguish consumers by appearance, 25,986.
Excessive use produces emaciation and pallor, 26,001; derangement of digestion, diarrhœa, and wasting, 26,022.
Abuse produces a haggard and careworn look, 26,040, 26,058.
Causes loss of appetite, constipation, nervous and mental weakness, *ib.*
Smoking, even in moderation, causes dyspepsia, anæmia, emaciation, &c, 26,057.
Detailed statement of effects of moderate dose, 26,060.
Evil effects vary with the constitution, 26,286.
Consumers more or less emaciated, 26,518.
Regular consumers recognisable by peculiar alteration in form of eye, 26,542.
Poor habitual consumers unable to get strong food become dull, pale, and sleepy, 26,674.
Consumers can be told by peculiar brightness of eye, 26,703.
Excessive use deadens desire for food; body consequently becomes emaciated, and mind torpid, 26,711.
Photograph in "*Banner of Asia*" really represents a man born an idiot and deformed, not, as stated, brought into that condition through opium, 26,738–51.
Excessive use causes weakness, but does not shorten life, 26,770.
Under influence of opium, action of the heart becomes stronger, expression of eye more brilliant, and pupil slightly contracted, 27,135, 27,161.

PHYSICAL EFFECTS—*continued.*

Smoking reduces the flesh till men are mere skeletons, 27,203, 27,275–78, 27,283, 27,304–8.
Consumers known by their dull, heavy eyes, and haggard looks, 27,283.
Deterioration rapid among excessive smokers, 27,429.
Excessive use causes weakness and unfitness for work, 27,568, 27,570.
Without good food, consumers deteriorate, 27,569.
Opium does no physical harm to eaters but it does to smokers, 27,597.
Excessive smoking ruins the health and produces all sorts of ailments, 28,064.
Smoking dries the blood; affects both brain and liver, 28,124.
Excess causes permanent muscular inactivity and waste, 28,141.
Abuse brings on early decrepitude, loss of appetite, and morbid state of the secretions i. 139.
Large per-centage of diseases treated due to opium. ii. 315.
Marked physical change produced by madak smoking, ii. 413.
Consumers become pale, flabby and emaciated, ii. 414.
Smokers especially have a great dread of water, *ib.*
Evil effects of habitual use, ii. 415.
Old opium-eaters not likely to recover from dysentery or diarrhœa, ii. 461. 597.
Functions of internal organs affected, tending to general waste and emaciation, ii. 551.
Trifling causes induce fatal disease in habitual consumers, *ib.*
Results on physical and mental condition, iv. 377.
Opinions as to liability of consumers to disease, iv. 379; as to death from opium habit, *ib.*
Abuse causes cirrhosis of liver and dysentery, iv. 454.
Physical effects observed in Straits Settlements and Hong Kong, v. 148, 154–208 (par. 3); in China, v. 212–342 (par. 3).

POISON:

Regulation for the sale of poisons, 14,617–19.
Law unenforcible; any dispensary can sell poisons, 26,961–65.
English system of sale, 28,212–14.

*See* DRUGGISTS' LICENSES.

POLICY:

Anxiety to increase area under cultivation in 1869, and later, 3, 110; subsequent policy of reducing it, 3111.
State connexion with the opium trade immoral, 4–13, 105, 14,692.
Government connection with opium objectionable, 147.
Limited to placing a very heavy duty on opium, 264, 439–41.
Government connexion with opium and liquor objectionable, 708, 725–29.
Minimum of consumption, maximum of revenue, 872, 12,093.
No desire to increase consumption in India or China, 895.
Policy of system to restrict cultivation, 943–47.
Revenue no more immoral than British revenue from spirit licenses, 1153.
Restrictions on consumption deprecated, 1179.
Government should not be mixed up with production of opium, 1677, 1711–14.
Substitution of export duty would not increase amount sent to China, 1712–14.
Policy in 1860 to take as large a crop as possible, 1772–74; does not appear to have been changed, 1774–77.
Last document presented by East India Company contained reference to the importance of restraining consumption of opium, 1778.
Policy described by Mr. W. H. Smith, 2078, 2085–89.
Consumption discouraged by Government, 2101–10.

POLICY—*continued.*

Attitude of the Government, 2399, 2400.
Mistake for Government to retain monopoly, 24,334.
Government connexion with opium considered disgraceful, 10,618.
Erroneous popular view that Government trades in opium for sake of revenue, 23,359.
Parliamentary paper on the opium question, i. 140.
Admission of evils of traffic by Government, ii. 315.
Government connexion with the traffic undesirable, iv. 495.

*See also* BENGAL SYSTEM, CHINA—BRITISH POLICY.

POONA:

Consumption of opium by different races, 26,038, 26,055, 26,255, 26,286, 26,406; is not increasing, 26,263.
Smoking dens are still in operation, 26,286, 26,335–41, 26,344–47.

POPPY:

Stalks used as manure, 3255.
Green leaves are used as a vegetable, 3798, 8501, 11,017, 21,869.
Every part of the plant is useful: seed fetches a good price, 12,524.
All parts of the plant used, 14,462, 20,604, 21,655.
Sometimes grown for seed and capsules only, 20,182.
Uses of the poppy plant, 20,413*a*, 20,441–43, 20,951, 20,969, iv. 389.
Cultivated for eating purposes as well as medical, 24,237.
Flower petals, stalks, and leaves sold to Government, i. 134, 135.

*See* CULTIVATION.

—— HEADS:—

Use unknown in Burma, 6489.
Bruised poppy heads used by opium drunkards for infusion, 15,970.
Also for local application to the eyes, and fomentations, *ib.*
Poppy grown for heads (*post*) only, in Jullundur district, 16,469.
Sold to licensed vendors under present rules, 17,831.
Use almost hereditary among Mirasis, 18,427.
Decoction used with camomile as a local application, 21,989.
Largely used as medicine by the people, 23,874, 24,116, 24,627.
System of licensing and sale in Bengal, ii. 427.
Largely used in the Punjab, ii. 447.

*See* POST.

—— OIL:

Contains no opium; very largely consumed, 888.
Extensively used by confectioners, 3798.

—— SEED:

Seed is of considerable value, 2081.
Seed sold in the open market, 3252–54.
Poppy would pay to cultivate for its seed, 3284–88.
Seed used in form of condiment, 3,946.
Kachins eat the seed with rice, 6869–71; smoke poppy seeds, 7861.
Profits from seed, 11,017.
Price of seed pays for cultivation without hired labour, 12,241–45.
Fetches a good price, 12,524, 12,987.
Largely used as a medicine and condiment, 23,874, 24,116.
Considerable loss from sale of seeds if cultivation prohibited, 24,627.
Seeds an important article of consumption and commerce, i. 134, 135.
Declared value of seeds exported, i. 135.
Average annual export of Malwa poppy seed from Bombay, i. 136.
Importance of trade between India and Europe, ii. 525.
Contains no opium; very largely consumed, 888.
Exports estimated at Rx. 500,000; total value of trade, Rx. 4,000,000, *ib.*

POPULAR VIEW OF HABIT:

Consumers have nothing to say in favour of habit, 171.
Chinese admit that opium is a curse, 236, 2009.
Chinamen never defend opium smoking or eating, 374.

POPULAR VIEW OF HABIT—*continued.*

Few Chinese defend smoking, 644, 656, 657.
Habitual indulgence inconsistent with self-respect, 695, 711, 722–24, 742–46.
Bombay smokers not ashamed of habit, 1036–39, 1080–85; laughed at in Rajputana, 1087.
Men of good position not ashamed of opium habit, 1148.
Chinese popular opinion decidedly against the opium habit, 1380.
Chinese sometimes speak against habit out of mere politeness, 1637.
Opium called "foreign medicine," *ib.*
Opium-eating, smoking, or drinking a vice, 1896, 1918.
Smoking spoken of in an apologetic manner, 2020.
Practice looked upon as a vice, 2304, 2320–22.
Smoking regarded more unfavourably than eating, 2321.
Smoking universally regarded as disgraceful, 2597.
Habit regarded as disgraceful, 3053, 5914, 5932, 6680–83, 13,032, 16,718.
Smoking considered disgraceful; eating is not, 4145, 4188–92.
Use of opium by elderly people excused, 4281, 4358, 4359.
Eating opium regarded with indifference, 4505, 4506, 4562, 4569; smoking is not considered respectable, 4529, 4530.
Taking opium never considered as a disgrace, 4643.
Parents would not view contracting of habit by sons with complacency, 4982.
Smoking considered somewhat disreputable, 5329.
Native opinion is opposed to smoking, 5804–7.
Parents object to habit in young people, except under medical advice, 5995–6005, 6103–6.
Habit not regarded as wanting in respectability, 6224–27.
Habit regarded as more or less disgraceful, 6264, 6265.
Using opium for pleasure considered disgraceful by the Shans, 6941–46, 6961–66, 6983.
Habit concealed by reason of disgrace attaching to it, 6990–92.
Even a moderate smoker is considered an outcast, 7232–34, 7238–40.
Burmans consider opium habit disreputable, 7916.
Smoking considered improper by Mahomedans on account of its associations and injurious effects, 8464–70.
Parents generally opposed to use of opium by children, 8508–11.
Considered disgraceful in Bengali society, 8931–36; in Assam, 9051, 9113–17, 9138, 9151–57; by Bengali gentlemen even when used as medicine, 9328, 9369, 9370; by Hindus as well as Mahomedans, 9399–404.
Hindus consider it very disgraceful, 9465.
Among Brahmins use of opium is becoming disreputable, 9697, 9709, 9710, 9750–53.
Vast majority of Hindus do not so consider it, 9699.
Not considered very creditable in Assam, 10,323.
Habit, and Government connexion with it, considered disgraceful, 10,618.
Excess thought to be disgraceful, 10,988, 10,989.
Considered very disgraceful, especially smoking, 11,690.
Eating considered shameful in young people; tolerated in the old; madak and chandu smoking always disgraceful, 11,858, 11,860, 21,655.
No respectable man would willingly permit his son to take opium habitually, 11,873.
Not considered respectable by higher classes of Hindus, 12,389, 12,390.
Excessive use universally condemned, 12,578.
Elderly consumers lose their reputation as well as young ones, 13,242, 13,243.
Smoking regarded as a degrading vice, 13,516–19, 13,626, 13,627, 13,758.
Commonly regarded as disreputable, 14,003, 14,020–27.
Smoking popularly esteemed vicious, 14,352.
Vernacular books cited to show popular feeling against the habit, 14,519, 14,584–88, 14,755–57.
Consumers and sellers condemn it, 14,965.
Eating regarded with contempt, smoking with horror, 15,146.
Respectable natives look on the habit with disgust, 15,671.
Eating not generally reprobated, 15,698, 15,720.

POPULAR VIEW OF HABIT—*continued.*

Smoking, even in moderation, generally reprobated, 15,698, 15,721–25.
Few attempt to justify it, 16,093.
Not considered disgraceful, except in excess, 16,690.
Opium-eating regarded as disgraceful by upper and middle classes; smoking more so, 16,776, 16,822–26.
Not considered disreputable, 17,230, 17,240.
Educated classes would be glad to see consumption decrease, 17,447, 17,463.
Smoking considered disreputable, 17,704–8.
Moderate use neither good nor bad—is indifferent or middling, 17,877.
Excessive consumers looked upon with contempt, 18,064, 18,103.
Opium-eaters generally ashamed of the practice, 18,210.
Looked upon as quite disgraceful, 18,254.
Medicinal use not considered disreputable, 18,428, 18,450, 19,066, 19,072–76.
Some educated people think opium pernicious, 18,431.
Moderate consumption quite respectable, 18,456.
Reprehensible in case of young persons, 18,461.
Better class of people do not smoke; it is not considered respectable, 18,795.
Opium-eating not looked down upon like smoking, 18,819, 18,839, 18,845–47.
Not regarded as a bad thing like charas, ganja or alcohol, 18,871.
Not looked upon as a vice, but as a medicine, 18,893.
Habitual use for intoxication looked upon as disgraceful, 18,961, 18,972.
Consumers not considered very prudent, 19,001.
Excessive use looked upon as disgraceful, 19,029, 19,035.
No community in India which does not regard it as disgraceful, 19,042.
Excessive use looked upon as a vice, 19,084.
Eating looked upon as innocent; smoking injurious and disreputable, 19,097, 19,124, 28,025.
Smoking not considered disreputable only on account of its associations, 19,127.
Even moderate consumers looked down upon, 19,282.
Only fanatical religionists condemn moderate use, 19,316, 19,324–28.
Excessive use condemned by all classes, 19,316.
Not considered so disgraceful as liquor, 19,317, 19,330.
Moderate use not considered disgraceful, 19,355, 20,171, 20,279, 21,812, 21,870, 22,665.
Eating, especially smoking, generally looked upon as a bad habit, 19,393.
Respectable people strongly against smoking, 19,593–97.
People always ashamed of smoking, 19,732.
Not considered disreputable, 19,749; except in excess, 19,823.
Looked upon as very disgraceful, 19,915.
Natives ashamed to confess to opium-eating, 19,947, 19,951–55, 19,968–75, 20,089.
Opium-eaters looked down upon by society, 20,047, 20,077.
Smoking everywhere looked down upon as disgraceful, 20,424.
Patients usually deny opium habit, 21,333.
Looked upon with disfavour, 21,386.
Excessive consumers regarded as Europeans do drunkards, 21,414.
Admitted to be disgraceful by users and non-users, 21,465–71.
Moderate use neither immoral, degrading, nor injurious, 21,879.
Not recommended as a custom, 21,976.
Excessive consumer does not suffer social opprobrium if health preserved, 22,385, 22,393.
Smoking in dens considered disreputable, 22,661.
Use for non-medical purposes not considered with disfavour, 22,716.
Habitual consumption regarded with indifference, 22,853.
Very popular, not considered a vice, 23,261.
Never openly acknowledged or defended until lately, 23,309, 23,333, 23,337, 23,347–52, 23,457.
Habitual users pitied, blamed or despised, 23,309, 23,318.
Opium-eaters a disreputable class of people, 23,359, 23,382.
Confirmed users much disrespected, 23,491*a*, 23,511.
Looked upon with contempt, 23,690.

Popular View of Habit—*continued.*

Consumers admit it is a bad habit, 23,705.
Non-medicinal use not disfavourably regarded, 23,752.
Decidedly considered disreputable, 24,114.
Condemned by most devoted consumers, 24,122.
Not looked down upon like liquor-drinking, 24,327, 24,519, 24,543.
Regarded as something between tobacco and alcohol, 24,860.
Many of the people who look upon use of opium as disreputable hold similar views with regard to coffee or tea, *ib.* 24,876.
Disrepute of smoking due to presence of mendicants, and idlers who frequent the shops, *ib.*, 24,869–71, 24,877.
Being general in China, is not regarded as demoralising, 25,027, 25,033, 25,067.
People in favour of use but against abuse of opium, 25,227.
Even moderate eaters detest and shun excessive users, 25,395.
Consumers keep habit secret; hesitate about inducing others to adopt it, *ib.* 25,414.
Habitual moderate use not considered disgraceful, 25,841.
Not considered respectable, 26,271.
Smokers are generally idlers, 26,272.
Universally regarded as a disgrace, 26,286.
Smoking is disgraceful and should be stopped, 26,436.
Tamils and people of S. India regard consumers with utmost contempt, 26,518.
Considered very disreputable except as medicine, 26,586.
Habit considered bad; term afimi always used in contempt, 26,892, 26,905.
Smoking considered disgraceful, being resorted to for aphrodisiacal purposes, 27,004.
Smokers express great desire to see opium prohibited, *ib.*; do not seem inclined to leave off the habit, 27,015.
Smoking most decidedly considered disgraceful, 27,215.
Opium-eating not considered a vice; madak-smoking generally condemned, 27,394, 27,430.
Nothing can be said in favour of smoking, 27,466.
Habit universally condemned, 27,467.
Absolutely condemned as a vicious habit, 27,511, 27,559.
Some habitués defend the practice; others do not, 27,544.
Society quite indifferent to opium habit, 27,566.
Opium-smoking makes a man contemptible, 27,597, 27,607.
Habitués of smoking dens in favour of prohibition as a benefit to the rising generation, 27,645, 27,680; promised to come for medicine to stop habit, but failed to do so, 27,682–84.
Chinamen as a rule do not like to own to being smokers, 27,753.
Smoking universally looked upon as a vice, *ib.*
Inexcusably stupid people called "opium smokers"; epithet invariably resented, 27,838.
Madak-smoking much looked down upon; scarcely anyone in favour of it, 27,885.
Madak-smokers usually objectionable characters, 28,080.
Smokers looked down upon, 28,109.
Native opinion not adverse to eating; smoking regarded as a disgrace, 28,147, 28,160.
Smokers held in disrepute, 28,168.
Smokers regarded with contempt, ii. 414.
Vast body regard habit with abhorence, ii. 544.
"Opium-eater or smoker" almost synonymous with "habitual thief" in Burma, ii, 575.
Regarded as indifferent; neither virtue nor vice, iv. 375.
Habit not considered disgraceful by Rajputs, iv. 380.
Chinese do not generally condemn habit, v. 150.
Malays condemn smoking as sinful and degrading, v. 151.
Popular view of the habit in the Straits Settlements and Hong Kong, v. 150, 154–209 (par. 9); in China, v. 213–342 (par. 9).

Possession:

Often used as a means of getting up malicious prosecutions, 14,798.
Minimum quantity authorising police interference, 16,040, 16,041, 16,047.

Possession—*continued.*

Maximum allowed without license, 23,672, ii. 348–54, ii, 428; in Bombay, 24,822–45.
Reduction of amount allowed without license, ii, 397.

Post:

Sikhs generally prefer the decoction, 927.
Decoction of poppies, very injurious to health, 16,231.
Drinking post is very injurious, 16,476.
Drinking formerly prevalent among the Sikhs, 17,830.
Poppy capsule steeped, then squeezed in water, 20,212.
Cheaper than other forms of opium, 20,990.
Used by poorer class Rajputs, 21,759.
Poppy boiled in water for fomentation, 24,904.
Mode of preparation, v. 123.
Effects very injurious, *ib.*

Posti:

Post drinkers; an expression of contempt, 18,361.

Powdered Opium:

Quantity manufactured and issued, and value, 1883–84 to 1892–93, ii. 329.

Precedents for Prohibition:

Age of consent; Government interference not a precedent for prohibition of opium, 14,848–50; caused great excitement, 19,917; no precedent; Native States left free in the matter, 20,813, 20,825.
Suttee; Government interference not a precedent, 14,848–50; being connected with religious rites cannot fairly be compared with opium, 19,918, 19,931, 19,965–67; prohibition not quite analagous to prohibition of opium, 20,773-76, 20,785, 20,808, 20,811; Government did nothing beyond pointing out objectionable nature of practice, 21,834.
Abolition of salt monopoly not analagous to prohibition of opium, 20,773-81, 20,840–42; entirely a matter of arrangement with the States, 21,858.
Precedent found in prohibition of various cruel religious rites, 19,917–22, 19,930, 20,021–26.
No comparison between reforms in England and India, 20,036.

Preparations of Opium:

Opium occasionally mixed with ganja; use very injurious, 1151.
Various forms in which taken, 3803, 20,414, 21,128, 21,150, 21,156, 23,792, 23,874, 24,117, 24,185, 24,776, 24,904, 25,508, 25,565, 25,567, 25,903, 25,955, 25,987, 26,002, 26,040, 26,060, 26,613, 26,639, 26,675, 26,802, ii. 413.
Restrictions should be put on sale, 4606.
Kachin method of preparing opium for smoking, 7861, 7872.
Method of preparing opium for smoking at the jade mines, 7978.
Method of preparation, 14,971.
Description of opium and its preparations, 20,323.
Used in four forms by Rajputs, 20,990; by Marwaris, 21,073, 21,082.
Form of consumption in Baroda, 22,577.
Various preparations indulged in, 25,567.
Correspondence respecting consumption in unlicensed places, ii. 392–97.
Mode of preparing opium, v. 123.
Morphine value of different smoking preparations, v. 195, 196.

Prevalence of Habit:

Habit not generally prevalent in India, 711, 712.
Common in all opium growing districts, 738.
Opium consumed from time immemorial, 872, 898.
Consumption of opium by the different races, 897.
Not so prevalent in Bombay as in Rajputana, 1029.
Large sections of the population do not use opium 1041.
Opium-eating not common; it is too expensive, 1555, 1556.
Opium is not an Indian vice at all, 1601.
Opium abused to a certain extent in the great cities of India and the East, 1637.
Habitually used in moderation by tens of thousands, *ib.*

PREVALENCE OF HABIT—*continued.*

Smoking confined to cities and towns in India, 2322.
Consumption greater in towns than in country districts, 2807, 2808, 8482.
30 to 40 per cent. of Assamese Hindus smoke, 3166.
More consumed in Behar than in Lower Bengal, 3602, 3605.
Not confined to any special social stratum, 3676.
Prevalence of the habit in Calcutta, 3774, 3775.
Two per cent. of adult males use opium, 3886-90, 3921-28.
Rural population rarely use opium, 3922.
Smoking is diminishing, 3939, 3975, 3976.
Comparatively rare among upper classes, 4124-30.
Quite exceptional to find an agricultural labourer an opium-eater, 4280.
Smoking not prevalent in Orissa, 4510-13, 4528-34.
Consumption by the cultivating class in Balasore, 4615, 4635-37.
Per-centage of races among consumers in Calcutta, 4705.
Consumption by people in malarial districts, 5503.
By non-agricultural portion of the community, 5504.
Habitual takers mostly live in towns, 5548-52.
Smoking confined to lower stratum of the middle classes, 5825.
Prevalent among the upper and middle classes, *ib.*
Cultivators, palkee bearers, and fishermen not in the habit of using opium, 5855-63, 8599, 8636.
50 per cent. in some villages, 5942.
Palki bearers and fishermen take opium, 6204.
More usual among middle and upper classes, 6386, 6387.
Consumption about the same as it was 20 years ago, 7421, 7428.
Labouring classes and those exposed to night air commonly take opium, 8437, 8476.
Agricultural classes do not use it much, 8480, 8481.
Generally used in Oudh, Murshidabad, and Calcutta, 8504.
Not largely used in Bengal and Behar, 8506.
Consumption not confined to any particular class, 8594.
More prevalent among upper classes than lower, 8636.
Consumed in moderation by all classes of Hindus and Mahomedans, 8763.
Used to some extent among upper and middle classes, especially in towns, 8783, 8784.
Opium much used as a narcotic, 8805.
Used by all classes and grades of Native society, *ib.*, 8812-15.
Habit growing steadily in Calcutta, 8860-68.
Cultivators and fishermen do not as a rule take opium, 8922.
Smoking confined to low class of Mahomedans, 9319.
Large consumption in Orissa, 10,625-28, 10,646.
75 per cent. of the people in Balasore use opium, 10,693.
10 per cent. of adult males in the upper and middle classes, and one per cent. of the lower classes take opium, 10,725.
Not confined to any particular class, 10,942.
A few Mohomedans smoke chandu, 10,977.
Hindus in Behar smoke madak, *ib.*, 10,998.
Smoking is not a general practice with the people, 11,211, 11,222.
Ryots not consumers as a rule, 11,313.
Consumed by large number of the poor labouring class, 11,393, 11,394.
Common among elderly people, 11,676, 11,704.
Labouring classes seldom take opium, 11,881.
Consumption by the various races of Bengal, 11,887, 11,888.
Common among all classes, 12,515, 12,516.
Consumption not confined to any class; very small among rural population, 12,563.
20 per cent. in large towns use the drug, 12,564, 12,586.
Per-centage of consumers among different races, &c., in Allahabad, 12,652.
Hindu cultivators do not use opium as a rule, 12,809.
30 per cent. of men, 4 per cent. of females, and 5 per cent. consume opium in Mirzapur, 13,008.
Extensively used in the Punjab, Rajputana, Assam, Deccan, and Bengal, 13,088.
20 per cent. habitual consumers, 13,091.
Proportion of opium-consumers very large, 18,416.
Polygamous races chief consumers, 13,841, 13,852.

PREVALENCE OF HABIT—*continued.*

Common among the martial races, 13,863, 13,864, 13,876.
Use by cultivators in villages very small, 13,951, 13,952.
More or less general in India, 13,978.
Mahomedans form the bulk of opium-eaters, 14,225.
Very common, in moderation, among the Sikhs, *ib.*
Moderate use of opium is widespread, 14,303-5.
Habit has grown notwithstanding reduction in number of shops and increased price, 14,976, 14,981-89, 14,981-99, 15,042.
Very little consumption among the rural population, 15,324.
Almost unknown in the villages, 15,384.
Only 10 or 12 per cent. of opium-users take it habitually, 15,956-58.
General among all classes, 16,055, 16,902, 22,779.
Common amongst the poorer classes and small shopkeepers, 16,540.
Smoking is not common in the North-West, 16,544, 16,585-90.
Smoking not very prevalent; dens exist in Umballa, 16,684.
Prevails amongst the uneducated, peasants, traders, and sepoys, 17,422, 17,443.
Appears to be decreasing, 17,446, 17,464, 17,471.
Opium largely used, 18,090.
20 per cent. smoke in the North-West Provinces, 18,092-94.
Smoking more prevalent in cantonments than cities, 18,264.
20 per cent. of Lahore population eat opium, 18,429, 18,430.
A certain proportion of respectable labouring men smoke, 18,552.
Excessive use confined to the lowest classes, 18,957, 19,029.
Prevalent among Hindus and Mahomedans, chiefly among lower classes, 19,066.
Confined to no particular class or race, 19,353, 19,757, 19,777, 19,780, 19,837.
Chandu smoked a good deal in Ghazipur, 19,389.
Largely consumed by almost all Indian races, 19,434.
Consumption much larger among urban than rural population, 19,527.
Smoking restricted to small portion of urban population, *ib.*
Depends upon surroundings rather than race, 19,528.
More common in West than East, *ib.*
Races possessing finest physique and martial character most addicted to opium, *ib.*
Opium used mainly for non-medical purposes among all races of India, 19,719.
Common among all races, 19,883, 19,890.
Opium consumed by all classes in Jeypore, 20,268.
Occasional or habitual consumption almost universal in Rajputana, 21,443.
Very large per-centage of cultivating classes take opium, 21,942.
Proportion varies greatly; much higher in malarious districts, 22,010, 22,041-49.
Number of excessive consumers smoke, 22,016.
Chiefly used by warlike and turbulent classes, 22,385.
Educated people do not generally take opium, *ib.*, 22,441*a*-44.
50 to 75 per cent. of the Talukdars of Ahmedabad use opium, 22,688.
Number of habitual consumers considerably less than a generation ago, 22,700, 22,705.
Habit does not appear to be dying out, 22,734-37.
Numbers greatly diminished by enhanced price, and spread of education, 22,756, 22,768, 22,794.
Decrease in number of consumers desirable, 22,767, 22,796.
Most prevalent among Rajputs, Girasias, and Musalmans, 22,828.
Decreasing with spread of education, 22,851, 23,690, 23,708, 23,767.
Opium consumed by all castes, 23,261.
Smoking comparatively rare in India, 23,309, 23,333.
Consumption will become less as education advances, 23,612, 23,615.
Rising generation not inclined to take opium, 23,664, 23,750, 23,767-69.
Youths giving up opium and taking to alcohol, 23,864, 23,867-71.
Not limited to any class, race, or age, 24,113, 24,118.
Fewer consumers than 20 years ago, 24,195.

PREVALENCE OF HABIT—*continued.*

Consumption decreasing through spread of education and dearness of drug, 24,196, 24,222, 24,225, 24,239–43, 24,267, 24,283, 24,307, 24,384, 24,408–11, 24,523, 24,524, 24,551.
Use decreasing, as habit does not find favour with rising generation, 24,408.
Use of opium decreasing; probably due to increased indulgence in alcohol, *ib.*, 24,551.
Not general among higher castes, 24,566.
Smoking confined to a small and more or less degraded class, 24,590.
Appears to be little used in Bombay, 24,670.
Habit said to be decreasing, 24,926–36.
Insurance statistics show that 2 per cent. of the people use opium, 24,952–58.
All classes of Hindus and Mahomedans eat opium; a very small per-centage smoke it, 25,011.
Consumption in malarious districts chiefly as a prophylactic, 25,227.
Mostly confined to the poor and working classes in Bombay, 25,254.
From childhood people taught to believe in opium, 25,300.
Opium not used so commonly in Southern India as in the North, 25,350.
All races and classes eat opium, 25,508.
Less than 5 per cent. of population eat opium, *ib.*
Madak smoked chiefly by lower classes, *ib.*
Smoking increasing in Madras, 25,522, 25,534–45.
Casually used to a large extent, 25,901.
Not confined to any one class, 26,406.
Two per cent. use opium in Gujarat, 26,923.
Largely consumed in Rajputana, Malwa, Central India, Kathiawar, Gujarat, &c., 26,967, 26,970.
Proportion of habitual eaters per mille amongst various castes, 27,132.
Only a very small per-centage of people take opium, 27,461.
Not confined to any class or race, 27,730.
Statistics as to prevalence collected by missionaries, 27,825, 27,826.
Smoking chiefly confined to the lower classes, 27,885.
Old women and infants comprise most consumers, 28,047
No particular class abnormally affected by opium, *ib.*
Smoking almost wholly confined to towns, 28,082.
Only bad characters take to smoking, 28,097.
Ten to 15 per cent. of population use opium, 28,124.
Great increase in number of madak-smokers, 28,129.
Madak and chandu-smoking much less resorted to than eating; chiefly among the poorer classes, 28,142.
Increasing during last 20 years, 28,186.
Extensively used in the Punjab, Deccan, Assam, Central, East, and South-west Bengal, ii. 444.
Large numbers, especially of labouring classes, take opium, iv. 375.
Proportion of consumers in the Native States of Rajputana, iv. 392–99.

*See also under the various Provinces and Native States, and Races—Rajputs, Sikhs, &c.*

PRICE :

Price paid to cultivators, 3013–17.
In Assam, 3103, 3107–13, 5648–50, 5659.
Prices in various districts, 3195, 3201–3, 3205–8, 3235–37, 5036, 5064–68.
Kept down through fear of smuggling, 3206–8.
Government price in Orissa, 4523.
Assam Government wishes price raised, 5068–77.
Seriously affected by the change of currency, 5128–32.
Government price of poppy too low, 10,796–98, 10,806–8.
Government should not increase price paid, 10,844.
Has not been raised during last five years, 10,914–19.
Increased price would not render poppy cultivation more popular, 11,019–21.
Government price does not allow cultivator a fair profit, 11,201–15, 11,220, 11,249, 11,250, 11,314, 11,315, 11,328, 15,063.
Government price insufficient, 11,437, 11,438, 11,453, 11,455, 11,463, 11,472.
Memorials from ryots asking for higher rate, 11,786, 11,787.
Government should pay higher price or drop poppy-growing, 12,062, 12,063.
Not sufficiently high to admit repayment of advances in bad seasons, 12,084, 12,085, 12,144–48.

PRICE—*continued.*

Government purchasing and selling price should be raised, 12,374, 12,394.
Retail price at licensed shops, 12,945–52.
Licensed vendors charge what they like and increase their profit by adulteration, 13,040, 13,043.
Government rates too low, 14,473–80.
Increase in Government price unnecessary, 14,854.
Would lead to increased illicit dealing, 14,863–65.
High price checks consumption, 14,907.
Habit has grown notwithstanding increased price, 14,976, 14,977, 14,981–89, 15,042.
Selling price in the Native States, 16,222.
Policy of the Government to raise the retail price as high as possible, 18,154–57, 18,160.
If pushed too high would promote smuggling, 18,154.
Low price tempts consumers, 18,962, 18,981–88, 19,029.
Maintained as high as possible having regard to risk of smuggling, 19,520–22.
Sub-treasuries sell cheaper than licensed vendors, 19,574–79, 19,608–13.
Enhanced price greatly diminishes number of consumers, 22,756, 22,768.
Should be gradually increased to check habit, 22,805
Should be lowered to meet wants of poor consumers, 22,926–29.
Should be made so high that people would gradually give up opium, 23,269, 23,471.
Rise in price would inflict suffering on the poor, 27,433.
Increase has greatly reduced consumption, 28,051.
Government price gives good return to cultivator, i. 134.
Cost price of Excise opium, 1880–1 to 1893–4, ii. 342.
Estimated cost price per chest of provision opium, 1883–84 to 1892–93, ii. 345.
Price to vendors and retail price, ii. 348–54.
Treasury price in Bengal, ii. 427.
Retail price in Malwa and other parts of Central India, iv. 417.

*See also under the various Provinces and Native States.*

PRISONERS :

Allowed opium if health gives way, 1469–75, 1492–94.
Stoppage of opium rarely does harm, 1736.
Opium-eaters a perfect nuisance in jail, 1920, 1949–51.
When opium stopped they howl all night, 1920.
Native prisoners in India, 2138–42.
Mostly addicted to opium, 2143.
Opium forbidden except for medical use, *ib.*, 2144.
Effect of deprivation of opium, 2219–24.
Sometimes suffer considerably through stoppage of opium, 3411.
Opium stopped immediately in every case, 3709–21.
Opium-eaters compare favourably with drunkards and ganja smokers, 5170.
Supply not always cut off from prisoners, *ib.*
Deprivation has no bad effect beyond distress, 7380–86.
Pains caused by cutting off opium soon pass away, 7424; diarrhœa is apparent for two or three days, 7448–54; accompanied by inability to work, 7450, 7506–8.
Opium not given unless doctor orders it, 9660–64.
Opium-eaters do not seem to suffer after three or four days' stoppage of drug, 9766–70, 9806–12.
Opium only supplied on doctor's prescription, 10,428–38.
Occasionally suffer very much through deprivation of opium, 10,673–77.
Proportion of opium-eaters in Allahabad Central Prison, 12,459–63, 12,483, 12,484, 12,499–501.
4 or 5 per cent. excessive consumers, 12,567.
Per-centage of opium users, 14,058.
Statistics of health, 14,061.
Opium stopped but given afterwards if necessary to health 14,064, 14,065, 14,102–4.
Craving usually subsides within a week or so of admission, 15,910.
Seldom necessary to continue opium after admission, 15,911.
Usually resume habit on leaving jail, 16,547, 16,626, 16,627.
Very small per-centage addicted to opium, 16,577.
Less than per-centage of entire population, 16,580–84.
Per-centage less than of general population, 16,657.

PRISONERS—*continued.*

No serious ill-effects follow deprivation of opium, 17,266–72.
80 per cent. got bad diarrhœa which continued till opium restored, 17,422.
Health of prisoners improved by deprivation of opium, 18,247.
Dyspepsia and diarrhœa follow sudden stoppage of drug, 18,485–92, 18,499.
Few deaths consequent on stoppage of opium; patients suffering from chronic disease; death probably accelerated by stoppage, 18,513.
Stoppage of opium almost invariably followed by diarrhœa, 18,740.
Opium allowed to excessive consumers for a time, *ib.*
Sudden stoppage known to result in death through dysentery, *ib.*
Per-centage of opium consumers, 18,743–47.
Excessive consumers improve in health during confinement, 19,356.
Very small number addicted to opium, 19,391.
Notes of cases in Meerut Jail, 19,400.
Seldom any serious difficulty in stopping opium, 21,419, 21,420.
In British jails opium stopped, but restored if prisoner falls ill; given to consumers in Native jails, 21,828.
Subject to compulsory reduction of dose, 21,925.
Sometimes found impossible to discontinue opium, because of persistent diarrhœa, 22,016.
Opium allowed in Baroda State, 22,641.
Sometimes given small doses in case of illness, 23,431.
Opium suddenly stopped without ill-effects, 23,795, 23,818–20, 24,092–94.
Effects of stoppage of opium, 24,129.
Per-centage of opium-eaters in Junagadh Jail, *ib.*
Stoppage of drug often leads to diarrhœa or pains; moderate and gradually-diminishing doses sometimes acquired, 24,718.
Suffer at first from deprivation of opium, 25,931.
Statistics of opium-consumers in Ahmedabad Jail, 26,637.
Leave jail apparently cured of the habit, *ib.*
Habit broken-off by gradually diminishing doses, 27,387, 27,406–9.
Suffer terribly through deprivation of opium, 27,795–99.
Opium consumers in Junagadh Jail, 1889–90 to 1892–93, iv. 431.
Statement showing prisoners in Delhi Jail who were opium-eaters in 1893, v. 128–31.
Weights of prisoners (opium-smokers) for first four weeks' confinement in Victoria Jail, Hong Kong, 1890–92, v. 196, 350, 351.

PROHIBITION:

Opium should be prohibited except for medical use, 113, 114, 2272, 2274, 2601, 8622, 8646, 8808, 8809, 9442–44, 9467, 14,631, 14,657, 15,626, 19,288, 20,136, 24,301, 26,586, 27,217, 27,282, 27,339, 27,843.
Cultivation for medical purposes should be permitted, 713, 740.
Use of opium must be left to discretion of consumers, 1637.
Growth of poppy should be prohibited on moral grounds, 1802–21.
Petition in favour of prohibition presented, in 1859, by the Merchant Company of Edinburgh, 1820.
Would be very difficult, but habit should be checked, 1957–60.
Views of the Anti-Opium Association, 2457–66, 2481–85.
Benefit to the people would outweigh any deprivation to small classes, 2516–23.
Would be productive of commercial benefits to India and China, 2572–81.
Only sufficient opium for medicinal purposes should be grown, 2782–84.
No restriction can be placed on use of opium, 3730.
Would do more harm than good, 3758.
Manufacture and sale of opium should not be prohibited, 5989.
If not extended to use for medical purposes would be approved, 6265.
Sale or use of opium should be forbidden except at licensed houses, 7052–59.
Total abolition desirable, 7232, 7253, 7274, 7293–96.
Poppy growing should be prohibited, 7328–40.

PROHIBITION—*continued.*

Should be prohibited except as a medicine, 7803–10, 9853, 9932, 9935–43, 9951; with possible exception in favour of persons already consumers, 9854.
Prohibition except for medical use desirable, 9053, 9139, 9189, 9226–27, 9330, 10,237, 10,258, 10,259, 10,309, 10,621, 10,649–54, 13,033, 13,107–08, 13,194, 13,388–89, 18,104, 18,204, 20,049, 20,091, 20,136.
Would be a crime, 10,038.
Cultivation should be prohibited in Behar, 11,369.
Not desired except by missionaries, 11,897.
Consumption as an indulgence should be prohibited, 13,110.
Both alcohol and opium should be prohibited, 13,162, 15,656, 16,812, 18,046, 26,441, 26,499–501, 26,518.
Should be effected gradually by severance of Government connexion with cultivation, 14,005–7.
Could only be justified on strongest moral grounds, 14,846–52.
Stands on different grounds in Burma and India, 14,875–77.
Prohibition except for medical purposes recommended, 15,009, 15,020–25, 28,172, 28,212–18.
Prohibition of cultivation the only remedy, 16,568.
Except for medical purposes absolutely necessary, 16,569.
Prohibition would be favourably received apart from fresh taxation, 16,572, 16,574–76, 16,617.
Opium should be stopped whether alcohol is or not, 16,714.
No interference should be attempted unless backed by public opinion, 16,750.
Liquor, chandu, charas, and ganja should be prohibited, 17,854.
Would be a good thing, but the people would not so regard it, 17,879.
Worthy of support, as habit injurious, 17,905, 17,906, 17,970–73.
People against it because they fear taxation, 17,939, 17,974–79, 17,988.
Opium should be allowed for medical or quasi-medical use, 17,948.
Consumers would like to see sale prohibited, 18,023, 18,024,
Not so necessary with regard to alcohol as opium, 18,083.
Sale should be prohibited except for medical purposes, and for habitual users, 18,305, 18,330.
Desirable, except for medical purposes and confirmed users, 18,364.
Should not be interfered with and such things as ganja permited, 18,616.
Government policy of non-interference with vice should not be departed from, 18,620.
Can only be safely checked by spread of education, 18,624.
No objection to prohibition if effected without taxation, and gradually, 18,843, 18,848, 18,857–63.
Habit is bad, but does not call for interference, 18,903.
Recommended if unaccompanied with additional taxation, 19,001–3, 19,029.
Benefits would be outweighed by inconvenience, 19,720.
Use of alcohol in England does not affect the question of opium in India, 19,935–40, 20,027–35.
No reason to limit sale because of a few cases of excess, 20,181.
Country cannot be reformed by law; regeneration should begin from within, 21,349, 21,367.
Is impolitic; should be left to spread of education, 22,282.
Government has no right to prohibit opium and permit liquor trade, 22,308.
Sale for non-medical use should not be prohibited, 22,718, 22,855, 23,628, 23,659, 23,707, 23,753, 23,778, 23,826, 23,866, 23,878, 23,911, 23,928, 23,951, 23,983, 24,000, 24,014, 24,204, 24,237, 24,258, 24,279, 24,364, 24,376, 24,428, 24,470, 24,499, 24,514, 24,554, 24,649, 24,660, 26,410.
Total prohibition not advisable, 22,796, 22,893, 22,912.
Undesirable both politically and financially, 22,835.
Should be left to education, 22,928.
Restriction only feasible policy, 23,333, 23,339, 23,354.
Traffic in opium as an intoxicant should be stopped, 23,457, 23,465, 23,473, 23,512.
Opium should decidedly be prohibited, 23,549.
People of India do not understand prohibitive measures, 24,014.

PROHIBITION—*continued.*

Refutation of objections to total prohibition of opium, 24,327.
Would not remove evil caused by present excessive use, 24,812.
Interference undesirable and inexpedient, 24,907.
No reason why growth of poppy and manufacture of opium should be prohibited, 25,225.
Growth of poppy and manufacture and sale of opium, should not be prohibited, 25,265.
Government should not leave reform to moral agency, 25,527.
Interference with use of opium not recommended, 25,854.
Universal practice of dosing infants an insuperable obstacle to prohibition, 26,049.
Mischievous, and calculated to do more evil than good, 26,064.
All kinds of intoxicants should be prohibited, 26,590.
Policy of restriction by law recommended, 27,022.
Opium-eating should not be prohibited, 28,124.

—— UNJUSTIFIABLE:

Reasons for suppression unsound and visionary, 1153.
Opium may be restricted, but prohibition is entirely unjustifiable, 1637.
Forcible prohibition would be justifiable, 2468.
Should not be forced on people who do not want it, 2060.
Quite unjustifiable, 2709.
Would make English rule unpopular, 6120.
Unjustifiable interference with rights of property, 6121, 6143–51.
Most unjustifiable interference with the liberty of the subject, 10,785.
If accompanied with increased taxation would be unjust and unpopular, 12,733.
Government interference unjustifiable, 16,024, 24,454.
Idea is a mere chimera, 19,530.
Unjustifiable and dangerous, 22,667.
Most impolitic and quite uncalled for, 23,184.
Would be as tyrannical as prohibition of beer in England; uncalled for and wantonly foolish, 24,577.
Prohibitive measures uncalled for and unjustifiable, 25,569.
No cause to prohibit the sale of opium in British India, 27,036.
No moral justification for restricting sale, iv. 495.

—— IMPOSSIBLE:

Could only be enforced in British territories by bloodshed; in Native States could not be enforced at all, 872.
Would take years to accomplish, 2818.
Impracticable at present, 3058, 3099–101.
Prohibition of sale except for medical purposes impossible, 4269, 4270, 4448, 5330, 5340, 5508, 14,071. 15,915, 16,902, 17,231, 22,385, 27,433, 27,574, 28,148.
Would be an utter impossibility, 4719.
Would be ineffectual if not extended to Native States, 4891.
Would be entirely inoperative, 4997, 4998.
Impossible by legislation, 6345.
Present arrangements satisfactory, and prohibition impossible except on paper, 8408–10, 8492, 8493, 8500.
Impracticable in Assam, 10,206, 10,362.
Total prohibition almost impossible, 10,947, 10,983.
Prohibition, except for medical use, impracticable, 12,585, 18,147, 22,719, ii. 461.
Impossible to put down even immoderate use by force, 13,841.
Could not be carried out unless extended to Native States, 17,341.
Impossible to stop cultivation, 19,649.
Impossible so long as produced in Native States, 19,720.
Quite impossible for Government to prohibit opium-growing, 21,025.
Would be very difficult to enforce, 25,014.
Perfectly nugatory unless extended to Native States, 26,157.
Utterly impossible to interfere with domestic habits of the people, 27,038.
Attempt to prohibit sale would be a disastrous failure, 27,396.
Impossible and most undesirable, 27,973.
Worse than useless to attempt it, i. 142.

PROHIBITION—*continued.*

—— DANGEROUS:

Suppression of cultivation would lead to grave political difficulties, 885, 953.
Would lead to political dangers of extreme gravity, 900.
Would be a grievous interference with social habits and customs, 1007.
Prohibition of cultivation would make the people disloyal, 1611, 1612.
Would cause utmost irritation, especially among Sikhs, 1611.
Would excite gravest discontent, 2062, 2063.
Would be an absolute political danger, 3189–92, 3210.
Would create dissatisfaction, 3798, 6166, 6916, 8566, 21,773, 21,782, 25,196.
Would be highly impolitic, 4508.
The suggestion has alarmed the people, 4577.
Would meet with strenuous opposition, 4999.
A very much smaller thing raised the Mutiny, 5694, 12,726.
Would produce universal dissatisfaction and disaffection, 5739.
Likely to be a disturbance in Assam if stopped all at once, 9227–32.
Not likely to meet with violent opposition, 9963, 10,017–21; might do so if accompanied with additional taxation, 10,019–23.
If opium stopped the Assamese would revolt, 10,038.
Would create universal discontent, 11,392.
Would cause the horrors of 1857 to be repeated, 12,348.
Legislative suppression would cause great political danger, 13,843, 13,845.
Restrictive measures would be strongly resented, 13,883.
Prohibition without increased taxation would create discontent, 14,075, 14,076.
Legislative interference would be resented, 14,231.
Interference with consumption might be resented actively, 14,309.
Most dangerous policy to tamper with long-established custom, 14,356.
Discontent would amount to grave political danger, 14,912; consequent increase of taxation would cause still greater discontent, 14,913.
Might lead to loss of India, 15,696.
Would arouse feelings of consternation and resentment, 15,700.
Quite impossible, might lead to popular revolt, 15,915.
Would entail serious discontent and entail danger to the Government, 16,019, 16,024.
People would resent interference, 16,220.
Would be most unpopular in the Punjab, 17,073.
Would be unpopular with Native soldiers, 17,084.
Would cause serious inconvenience and trouble, 17,852–54.
Would be a serious interference with local habits in Rajputana, 19,957, 19,959.
Would be resented if accompanied by increased taxation, 20,069, 20,118.
Ancient customs of the Rajputs would be greatly interfered with, 20,604, 20,699.
Apart from finance, would be highly impolitic, 21,655.
Would cause general discontent among the Rajputs, 21,766.
Prohibition of opium is impolitic, 22,282.
Would be exceedingly difficult and dangerous, 22,283.
Would lead people to believe that the Government intends to tamper with religion, 22,385.
Would lead to much discontent and misery, 22,898.
Would be regarded as an act of injustice, 23,561, 23,584, 23,597.
Would interfere with ancient customs and create dissatisfaction, 24,236, 24,256, 24,260, 24,278, 24,408, 24,628, 24,660.
People would not like interference with their use of opium, 25,264.
Would lead to political complications with Native States, 26,006.
Would cause general discontent in Gujarat, 26,149.
Would be regarded as an active oppression, 26,408.
Attempt to interfere with use of opium would be impolitic, 26,654.
Would cause serious dissatisfaction, especially in Native States, 26,759, 26,776, 26,777.
Interference would be a serious wrong and deplorable mistake, 27,396.

PROHIBITION, DANGEROUS—*continued.*

Would cause great discontent, 27,734.
Total prohibition of opium-eating would be impolitic, 28,028.
Would be most unpopular in the Punjab, i. 142.
Would be bitterly resented by all classes, apart from taxation, iv. 495.
Would cause dissatisfaction in the Punjab, v. 124, 126.

—— EFFECT ON FINANCE:

Would be a capital political error to deprive Native States of their revenue, 1165.
Effect on Foreign Exchange, 2075, 2076.
Possible financial objections, 2561.
Would entail loss of revenue, 3193, 6060, 23,380, 23,913.
Could easily embarrass the Government, 3421.
Would mean financial ruin in Behar, 12,320, 12,346, 12,375.
Would be a very bad thing for the Indian tax-payers, 12,520, 12,544–51.
Mr. Caine's letter on the financial question, 14,759–68, 14,789.
Would cause loss of revenue and subject people to new taxation, 19,877.
Would upset the entire economy of the producing States, 20,435.
Would mean financial ruin to opium-growing Native States, 23,104.
Would not entail very serious loss in Central India, 23,457.
Would result in great loss to India, 23,612.
India would lose income, while Persia would gain by prohibition, 24,516.
Only effect would be injury to Government, 24,856.
Would entail heavy expenditure for preventive measures, 25,226.
Would entail immense loss to Indian Revenue, 25,552.

—— —— ON AGRICULTURE.

Would seriously disturb the agricultural economy of the country, 4891.
Would be prejudicial to important agricultural interests, 6424.
Would ruin thousands of cultivators, 10,797.
Prohibition of cultivation a grievous interference, 10,841.
Would be an unmitigated evil and very unpopular, 12,373, 12,376.
Unnecessary; ruinous to cultivators; would lead to further taxation, 12,853.
Would ruin a great industry, 12,978, 12,987.
Would cause great distress among the agricultural class, 13,414, 13,415, 13,419.
Suppression of poppy-cultivation injurious, 13,677, 13,678, 13,680.
Would injuriously affect an industrious and poor class of tenants, 14,399.
Would cause much distress to cultivators, 14,896.
Partial prohibition in Rai Bareli raised a considerable outcry, 14,930–37.
Would cause great hardship to cultivators, 15,341, 16,468, 16,485, 16,503.
Would ruin people engaged in opium-cultivation and trade, 18,620.
Would ruin landlords and tenants, 19,777.
Would be a serious loss to Government and cultivators, 19,815.
Would cause great dissatisfaction among cultivators and users, 21,773, 21,782.
Would cause dissatisfaction among Native rulers and farmers, 25,196.
Would be disastrous to the zemindar and ryot, 25,233.

—— —— ON SMUGGLING.

Establishment of a customs line 2,000 or 3,000 miles long would be impossible, 885.
Effects on smuggling and trade, 2931.
Would lead to smuggling, 3190, 19,757, 25,015, 25,061, 25,196.
Would encourage smuggling and surreptitious cultivation, 3799.
Would lead to increase of smuggling, 4891, 6061, 17,256, 22,385, 26,049, 28,023, 28,113.
Would encourage smuggling, especially from Nepal, 5510.
Would encourage smuggling, 6425.

PROHIBITION, EFFECT ON SMUGGLING—*continued.*

Smuggling and illicit growth would be increased, 8500.
Would be rendered ineffectual by illicit sale, 10,362.
Impossible, considering how easily opium may be smuggled, 14,798.
Impossible to stop smuggling, 18,150, 26,777.
Would be rendered impracticable through smuggling, 19,530.
Opium would be imported from Nepal and other places, 19,650.
Would necessitate costly preventive establishment in Central India, 22,164.
Forcible prohibition would increase smuggling and necessitate expensive preventive measures, 23,911, 23,913, 23,927.
Would lead to smuggling in spite of preventive departments, 25,569.
Would be useless in preventing consumption, 26,149.
Would increase smuggling from Native States, 26,156.
Further restrictions would greatly increase smuggling, 26,655.
Would involve a very costly preventive establishment, 26,845.
Would greatly increase smuggling, 26,970.
Would cause manifold increase in smuggling, 27,469.
Impossible; would be ineffectual through smuggling, i. 143.

—— —— ON CONSUMERS.

Total prohibition would entail great suffering on consumers, 708–11, 714–21.
Would cause much undeserved misery, 1153, 4150.
Would be injurious to the population, 4210, 4211.
Would be most disastrous in Assam, 5619, 10,206, 10,362.
Would lead to serious sickness among habitual consumers, 7194, 16,435.
The natives in the villages would perish, 10,038–41, 10,099, 10,118–28, 10,136–43.
Would deprive the poor of a domestic medicine, 10,206, 10,362, 19,719, 19,877.
Would increase mortality, especially in the aged and infants, 10,206, 10,362, 19,777, 19,829, 19,837.
Would produce disastrous effect on the people, and probably create dissatisfaction, 10,362.
Would be a great calamity, 14,461.
Would be a very great hardship, 16,074.
Would not be harmful except to consumers, 18,031–35.
Would be not only unwise but cruel, 20,263.
Great reason against prohibition; opium most available drug for relief of pain, 20,312.
Would cause considerable bodily pain to consumers, 20,921, 20,990.
Would be an act of the most cruel inhumanity, 22,014.
Would be a serious privation to habitual consumers, 22,385, 22,637.
Would entail great hardship on habitual consumers, 23,876, 23,909, 23,927, 23,951, 23,989, 23,999, 25,513, iv. 381.
Would be a dire calamity to consumers, 24,130.
Consequence would be serious to habitual consumers, 24,218, 24,408, 24,470.
Hardship would be only temporary, 24,327.
Closing the shops would bring injury to the Government and suffering to the mendicant and diseased, 24,863.
Would be a very great deprivation and destructive to to life, 26,386.
Total prohibition would be disastrous to the poor, 27,143.
Consumption cannot be stopped without serious consequences, 27,696, 27,701.
Absolute prohibition would be a great hardship, 27,698, ii. 317.
Would have a bad effect on health of consumers, 27,885.
Would mean lingering death to habitual users, 28,023.
Well-being of hundreds of thousands would be affected by prohibition, i. 133.

—— —— ON CONSUMPTION OF ALCOHOL, &c.

Would lead to use of more harmful stimulants, 1153.
Distillers would find a ready market if opium prohibited, 1177.
Would not, as a rule, lead to increase of drinking, 2822.

PROHIBITION, EFFECT ON CONSUMPTION OF ALCOHOL, &c. —*continued.*

Would lead to increased consumption of other stimulants, 4151–55, 4891, 16,009.
Poorer classes would take to ganja, and richer to alcohol, 4270.
Might lead to increased use of alcohol and ganja, 4781.
Would lead to increased consumption of alcohol, 5955, 5956, 8407, 8487–89, 10,206, 10,362, 12,815, 12,866, 15,389, 15,390, 17,074, 18,173, 22,289, 22,683, 22,741–44, 22,936, 23,728, 23,753, 23,876, 23,911, 23,927, 24,015, 24,811, 25,061, 25,104, 25,213, 25,225, 25,374, 25,513, 27,168, ii. 411–14.
Would lead to consumption of ganja or cheap liquor, 6042, 6836.
Would certainly lead to increased use of alcohol, 6167.
Checking supply would lead to consumption of spirits, 6691, 6707–9.
Would lead to use of some other kind of stimulant, 8565.
Would lead to increased consumption of ganja or alcohol, 8757, 8764.
Would certainly lead to increased consumption of ganja and alcohol in Assam, 9545.
If opium prohibited, consumers would take to ganja, 10,036, 10,038.
Would lead to increased consumption of arsenic, nux vomica, alcohol, or dhatura seeds, 13,841.
Would cause large numbers to resort to alcohol, 13,885.
Would lead to increased consumption of ganja and bhang, 14,195, 14,215.
Great hardship; would lead to very large consumption of alcohol, 14,415.
Would tend to spread the drinking habit, 16,114.
Would increase consumption of spirits and hemp drugs, 16,220.
Would lead to consumption of other intoxicants, 16,504.
Opium-eaters would hardly take to drink immediately, 16,712.
Would lead to use of worse stimulants, 16,902.
Opium would not be to a very great extent substituted by wine, 17,931–34.
Would not lead to increased consumption of alcohol, 18,118.
Would be superseded by liquors, 18,617–19.
Hindus would not necessarily take to alcohol if opium prohibited, 18,975–78.
People would probably take to drink if opium prohibited, 19,749.
Would lead to a calamitous increase of drinking, 19,885.
Would most certainly lead to extended use of alcohol, 20,173, 22,039.
Would lead to consumption of pernicious spirits, 20,263.
Excessive consumers would take to alcohol or ganja if deprived of opium, 21,023, 21,059.
Would lead to consumption of alcohol or hemp drugs, 21,655.
Would lead to increased consumption of liquor and ganja, 21,781, 24,908.
Cultivators might take to liquor if opium prohibited, 22,167.
Would substitute a race of liquor-drinkers for opium-eaters, 22,216.
Would lead to use of more pernicious narcotics, 22,385.
Patidars and high-class people would not take to alcohol if opium prohibited, 22,818.
Hindus would take to bhang or such intoxicants if opium prohibited, 22,819.
Would cause resort to other narcotic stimulants, 22,859, 22,869.
Would drive poorer classes to native liquors, 23,104.
Would lead to indulgence in other stimulants, probably alcohol, 23,184, 23,294, 26,699.
Would most decidedly lead to use of other intoxicating stimulants, 24,132, 24,218, 24,317, 24,327.
Would doubtless lead to use of alcohol or other drugs, 24,743.
Essentially necessary to allow non-medical use, because of religious scruples against liquor, 25,195, 25,213.
Stoppage of sale of madak would lead to consumption of ganja, 25,294.
Consumers would take to alcohol, ganja and other intoxicants, 25,570,

PROHIBITION, EFFECT ON CONSUMPTION OF ALCOHOL, &c. —*continued.*

Majority of natives would take to other harmful stimulants if opium prohibited, 25,892.
Would lead to use of hemp or alcohol, 25,962, 26,064.
Would drive people to alcohol or hemp, 26,026, 26,158.
Would undoubtedly increase the consumption of liquor, 26,430.
Idea that alcohol would replace opium fostered by Europeans who would be the first to oppose restrictions on the liquor traffic, 26,540, 26,550.
Would certainly increase use of alcohol, bhang or ganja, 26,617.
Religious scruples would prevent many people taking to alcohol if opium prohibited, 27,352.
Likely to lead to increased consumption of alcohol, 27,574.
Necessity might drive people to cheap alcohol, 27,594.
Would drive even Mahomedans to drink, 27,696, 27,698, 27,703.
Would lead to substitution of alcohol, 27,734.
Would lead to use of liquor, bhang or ganja, 28,023.
Vicious people would take to drink if madak prohibited, 28,085.
Consumers would infallibly have recourse to alcohol or hemp, i. 145.
Would lead to use of other intoxicants, notably ganja, ii. 415, 416.
Tendency to lead to extended use of alcohol and other drugs, iv. 377.
Opinion as to disastrous effects, *ib.*

Burman public opinion always adverse to opium, 6558.
Petition from Chinese in Rangoon in favour of total prohibition of opium, 8343.
Mahomedan public opinion opposed to prohibition, 8490, 8500, 8503.
In favour of prohibition provided no additional taxes levied, 8623.
In favour of prohibition on ground of immorality, 8647.
Strongly opposed to abolition, 8764.
General feeling of Indian people in favour of restriction, 8823.
Greater part of the people of Assam favour prohibition, 9054.
Views of the Association of Assamese students, 9059–71, 9118–22.
Favourable to prohibition, except for medical purposes, 9140, 9190, 9331, 16,690.
In Madras, favourable to modified prohibition, 9468.
Assamese educated opinion in favour of prohibition, 9855, 9868–73.
Opinion generally in favour of prohibition, 9902, 9903, 9933, 9934.
European tea-planters in Assam against prohibition, 10,198–10,120.
Native planters against entire prohibition, 10,203, 10,204, 10,318–22.
People of Assam perfectly satisfied with policy of Government, 10,208, 10,238, 10,250.
Views of the Jorhat Sarvajanik Sabha, 10,226–36, 10,269–92, 10,306–8.
Would decidedly favour prohibition, except for medical purposes, 10,504, 10,505, 10,512.
Feeling in Patna universally against prohibition, 10,800.
Native opinion that anti-opium movement is connected with Christian propaganda increases the dangers of prohibition, 10,841.
Favourable to total prohibition, 11,457.
Disinterested public favour prohibition, 11,693.
Native opinion largely one of indifference, 12,576, 12,600–3.
Interference with present arrangements not desired, 12,682.
Natives associate the anti-opium movement with religion, 12,726.
Native opinion indifferent, except where their interests are concerned, 12,766, 12,767, 12,775.
Absolutely opposed to prohibition unless loss of revenue can be made up without increased taxation, 13,194.
Views of the Kashi Sujan Somaj, 13,338–59.
Native opinion would strongly resent imposition to meet cost of prohibition, 13,692, 13,694.
Native opinion would favour restrictive, perhaps not prohibitive, measures, 14,008.
Anglo-Indian newspapers constantly drawing attention to probable increase of expenditure, 14,066–70.
Opinion favourable to opium unknown before appointment of Commission, 14,702–6.
Means of arriving at independent public opinion, 14,776–78.
Views of the Indian National Congress on alcohol and opium, 14,779–88.
Against prohibition, 14,813, 14,888, 17,216.
Government cares only for the revenue, 14,966, 14,967.

PUBLIC OPINION—*continued.*

Prohibition would be supported by general opinion, 15,519–23.
Views of the Rafa-i-Am Association, 15,575–79.
Native mind connects present agitation with liquor interests, 15,696.
Press writers in Punjab adverse to Government connexion with opium generally biassed by political motives, 15,701, 15,710, 15,726–31.
To Native mind an arbitrary and uncalled for exercise of authority, 15,907.
People in favour of use for non-medicinal purposes, 16,435–39, 16,442.
People in mourning since they heard that prohibition is in contemplation, 16,511.
Moderate users do not favour prohibition, 16,572, 16,618.
Respectable people, especially Mahomedans, would like to put a stop to opium, 16,754–56.
Influenced by De Quincey's writings, medical journals and missionary reports from China, 16,872.
Vast majority would regard prohibition as intolerable tyranny, 16,902.
In favour of continuance of present arrangements, 17,218.
Anti-opium articles in Native press no evidence of disaffection, 17,245.
Public opinion may be described as passive, 17,254–64.
Sikhs would consider prohibition a one-sided measure directed against themselves, 17,341, 17,389.
Punjabi opinion unfavourable to interference, 17,654.
People would regard prohibition as a great hardship, 17,695, 17,736.
General opinion would justify prohibition, 17,908.
Mahomedan Associations are against use of opium, 17,984–87.
Depends on the agitators among the masses, 18,106.
Arya Samaj would oppose opium if matter properly explained to them, 18,142.
Native mind connects the Commission with some secret motive, 18,147.
Great deal depends on intelligence and social standing of the people, 18,167, 18,168.
People would gradually come round in favour of prohibition, 18,205, 18,261–63.
People unconnected with Government would be very glad of prohibition, 18,306.
Object of Commission regarded as an indirect attempt to oust opium in favour of alcohol, 18,328.
Forty per cent. of consumers, mostly old people, would naturally oppose prohibition, 18,367, 18,381–90.
Parents of young consumers would think it a blessing, 18,368.
Natives surprised to see opium attacked and alcohol encouraged, 18,409.
No desire for prohibition among rural population, 18,431.
Grumbling against prohibition very common in Native States, 18,725–31.
Unfavourable to interference by Government, 18,870, 18,892.
People opposed to prohibition, as opium is useful, 18,904.
The discerning public would approve of prohibition, 18,995–97.
Prohibition would not receive general approval, 19,077–79.
Universally in favour of reasonable facilities for use of opium for non-medical purposes, 19,098.
Only a few people with extreme views desire prohibition, 19,099.
No feeling whatever against moderate or medicinal use, 19,235.
Majority would not object to restriction, 19,394.
Tendency to connect the movement with religious propaganda, 19,530.
People have no desire for alteration in present arrangements, 19,794.
People of India take no interest in this Commission, 19,917, 20,010.
Indians never heard to say a good word for opium, 19,951–55, 19,968–75.
Respectable community, apart from Rajputs, favours prohibition, 19,960–62.
Respectable and educated people would thankfully accept prohibition, 20,092, 20,106, 20,116.
Initiation of such reforms devolves on enlightened Natives, 20,242.

PUBLIC OPINION—*continued.*

Prospect of prohibition regarded with alarm, 20,425.
Native minds much disturbed by suggestion of prohibition, 20,604.
Result of a year's experience in Ajmere is that popular opinion is in favour of prohibition, 21,405–11.
Zenana ladies mostly in favour of prohibition, except as medicine, 21,506, 21,514–29.
Native opinion not directed to question before appointment of Commission, 21,655.
View of the Raja of Shahpura on prohibition, 21,718.
Interference with cultivation or consumption would be as unpopular as with tobacco in England, 21,818.
Rumour afloat in Central India that prohibition intended to encourage liquor trade, 22,161.
Popular idea that British Government intends to introduce liquor and prohibit opium, 22,249.
Commission has caused a universal feeling of alarm, 22,588, 22,597.
Individual high-caste people in favour of prohibition, 22,590.
Feeling that British Government is interfering with religious rites, 22,593.
Rumour that Government is closing opium shops in favour of liquor, 22,599, 22,667, 22,668.
Concurrence of this Commission and the Hemp Drugs Commission tends to spread the idea, 22,599, 22,667.
People would not approve of prohibition, 22,760, 22,762, 22,781, 22,789.
General public opinion decidedly against prohibition, 22,894–96.
Ignorant masses already attributing motives to British Government; some say to foster the liquor trade; others forcible conversion to Christianity, 23,104.
Opium Commission has created feeling of alarm, 23,186.
Various communities are in a body opposed to prohibition, 23,261.
Report current that Government is forcing Indians to substitute alcohol for opium against their religious precepts, 23,294, 23,297.
Rumour that opium is to be suppressed in interest of liquor traffic shows that effort is made to oppose suppression, 23,309.
Many people speak in favour of opium since Commission came, 23,362.
People not disposed to give up non-medical use of opium, 24,217.
No desire for prohibition in Mahi Kantha, 24,252.
People have no desire to limit consumption of opium, 24,576.
Except a few enthusiasts, no Natives of India object to present system, 24,811.
People in Gujarat are already saying, "What has come over the English," *ib.*
Erroneous views formed from imperfect knowledge or exaggerated statements regarding evils of the habit, 24,852.
Prohibition regarded as an intention of the Government to interfere with Native customs, 24,855.
Prevailing belief that Government follows Abkari policy with true instincts of a trader, 24,908, 24,920.
Poorer classes pleased with prospect of closing smoking shops as a protection to their children, 25,522, 25,550.
Working people regard the question, apart from taxation, with indifference, 26,257.
People fear agitation got up in interest of liquor traffic, 26,430.
Prohibition of sale, except for medicinal use, would be considered tyranny, 26,468.
Harmfulness of opium never disputed by Indians before appointment of Commission, 26,540.
Views appear to be influenced by fear of increased taxation, *ib.*
People would gladly support legislative suppression of opium, except for medicinal purposes, 26,891.
Indians do not speak readily of the opium traffic, because they fear prohibition would lead to use of alcohol, 26,893, 26,901.
If Commission had taken alcohol, opium, and ganja, the Indians would have unanimously supported abolition, 26,893–95.
Middle-class Indians suspect Commission was appointed in interest of liquor traffic, 26,898.

PUBLIC OPINION—*continued.*

Common people most decidedly against opium, 27,004.
Views of the Anglo-Indian and Western Eurasian Association of India, 27,147–57.
Would favour prohibition if unaccompanied with increased taxation, 27,282.
Decidedly averse to prohibition, 27,431.
Indian editors unanimous in condemning opium traffic, 27,511.
Anti-opium movement regarded as purely sentimental, 27,698.
General public and large number of victims in favour of prohibition, 27,844.
Resolutions passed by the Mahajana Sabha, Conjeeveram, 27,878–83.
People generally desire no change, 28,068.
Views of the Calcutta "Bangabasi," i. 144; of the "Bombay Samáchár," i. 145.
Memorial of the British Indian Association, ii. 313.
Memorial of the Calcutta Missionary Conference, ii. 314, 319.
Natives overwhelmingly in favour of opium, ii. 318.
Discussion at meeting of Calcutta Medical Society, ii. 407–25.
Views of the clergy in Calcutta, ii. 438.
Views of the Bengal Chamber of Commerce, ii. 439–52.
Views of the American Baptist Missionary Union in Assam, ii. 460.
Memorial of the Jorhat Sorbojanik Sobha in favour of opium traffic, ii. 462.
Views of the Upper Indian Chamber of Commerce, ii. 525.
Resolution passed by the Young Arakan Club regarding opium traffic, ii. 604.
People object to prohibitive measures, iv. 374, 375.
Suspect that opium agitation is in favour of liquor traffic, v. 125.
Memorial of the Behar Indigo Planters' Association, v. 136.
Resolution passed by the North-western Provinces Methodist Episcopal Church Conference, v. 137.
Memorial signed by the clergy of the Diocese of Lucknow, v. 138.
Memorial from Chinese residents in Moulmein, v. 345.

—— REVENUE:

License fees, gain on excise opium, duty on Malwa opium, and acreage duty, 1883–84 to 1892–93, v. 115.
Ditto (by districts), 1892–93, v. 119.

—— SALE:

Sale of madak and chandu discontinued, 15,703.
Closing shops has led to establishment of private clubs, 18,200–2.
Chandu and madak still sold, 18,258.

PUNJABIS:

Opium habit a prevalent vice, 2246.
Opium-eating peasantry hardy and thrifty, 16,902.
Smoking exceedingly rare in the Punjab, *ib.*
Excessive consumers not one in a thousand, 17,366.
Chandu smoking almost unknown, 18,795.
Ratio of consumption to population no cause of anxiety, i. 142.

Q.

QUININE:

Constantly prescribed in malarious districts, 698, 747–50.
Opium is cheaper, 2163, 2168.
Much more used as a preventive of fever than opium, 2595.
Supplied free of cost, 3127–30.
Native prejudice against quinine, 3198.
Unreasonable Native objection, 3520.
Natives do not believe in it, 4410.
More useful as a prophylactic than opium, 4725.
Coming into favour among the people, 17,175.
Natives know its value now, 19,509.
Native prejudice has died out, 19,924.
Used by Natives in Baroda, 22,447.
Natives prefer it for fever when they can get it, 23,457, 23,466.
Government measures for distribution will decrease use of opium, 27,858.
Would replace opium in malaria, ii. 461.

RAJKOT:

Consumption of opium, 24,380.

*See also* NATIVE STATES.

RAJPUTANA:

Col. Tod's "Annals of Rajasthan," 20,294–99, 21,298; little if any truth in his statement, 21,365.
Insanitary conditions very unfavourable to life, 20,309.
Statistics of the Province, 20,392–93; proportion of opium to total revenue, *ib.*
Arrangements with reference to witnesses, 20,395, 20,398, 20,436, 20,437.
Observations on statistics furnished by the States, 21,544–75.
Petitions in favour of opium traffic, 23,551.
States producing Malwa opium, ii. 346.
Questions issued to Durbars in Rajputana, iv. 384–88.
Statistics regarding opium in the Native States, iv. 392–99.

—— COMPENSATION:

Enormous sum estimated to be due to people affected, 20,768.
Payment would not prevent consumption of opium, 20,778.
Would be such a tremendous sum that Government could not pay it, 20,843–47.

—— CULTIVATION:

Proportion of poppy crop to total irrigated area, 20,392–93.
Area under poppy cultivation, 20,411.
Production of opium, *ib.*

—— DUTY:

British Government cannot interfere with Native States, 20,834.
Transit duty not settled by treaty; can be varied, 20,835.

—— EXCISE:

Arrangements of Native States very troublesome, 20,783.
Arrangements with Native States regarding opium ii. 355.
Clauses relating to opium in Salt agreements, 1879, *ib.*, 359.
Right to levy transit duties, ii. 355.

—— EXPORT:

Exports of opium, 20,411.
Two-thirds of opium exported from Jeypore as Malwa opium, 20,831.

—— OPIUM:

Opium as strong as Benares and Patna opium, 20,275–77.

—— PREVALENCE OF HABIT:

Opium habit prevalent, 2246, 2249, 2250.
Per-centage of consumers, 20,416–20.
Excessive use uncommon, 20,596.
Cultivators and labourers generally take opium as a stimulant, 20,597–603.
Fifty per cent of the middle classes take it, 20,602.
Opium largely used in Rajputana, 20,854.
Opium habit among various races, 21,440–43.

RAJPUTANA—*continued.*

—— PROHIBITION:

Would inflict serious loss on cultivators, 20,435.
Would upset the entire economy of the producing States, *ib.*
Wholly impracticable, would lead to serious discontent, 20,768.
No precedent for right to interfere with growth of opium, 20,782.
No Native State has expressed willingness to prohibit cultivation, 20,791
Prohibition in India becomes a question of transit, 20,794–805.
Would involve a large increase in preventive establishment, 20,806.

—— TRANSIT:

Duty not settled by treaty; can be varied, 20,835.

*See also* NATIVE STATES:

RAJPUTS:

One of the finest races physically in all India; almost invariably habitual consumers of opium, 872, 897–99, 927–30, 1009–14.
Six to eleven per cent. of Rajput soldiers take opium, 931.
Great majority, especially Native gentlemen, use opium, 1002, 1010–12, 1043.
Prohibition of non-medical use would be a grievous interference with habits and customs, 1007.
Habit probably first acquired through use when fighting, 1099.
One of the finest races, have been taking opium for generations, 1595, 1596.
Fond of liquor, if they can get it, 1599.
Largest consumers of opium; sturdiest people in the country, 2706, 22,582.
Considerable proportion take opium habitually, 3405, 3450.
Some Rajputs take opium from birth, 6040.
Seventy or eighty per cent. take it, 6047, 6057.
Physical degeneration due to opium observed among Rajputs in Calcutta and Jeypore, 8805, 8885.
Twenty per cent. of Rajput soldiers use opium, 12,901.
Numbers of Rajputs addicted to habit from childhood, 12,934.
Habit common among the martial races, 13,863, 13,864, 13,876.
Native soldiers from Oudh do not take opium as a rule, 14,156, 14,166–68.
Rajputana Rajputs use opium largely, 14,181, 14,182.
Twenty-five per cent. of the adult males use opium, 16,062–67.
Military services prove that moderate consumption does not demoralise, 16,219.
Fifty per cent. adult males eat or drink opium, 18,348, 21,761; about 7 per cent. to excess, 21,762.
Mahomedan Rajputs use opium as freely as the Sikhs, 18,434.
Ninety per cent. use opium, 19,729, 19,898, 23,184.
Fifteen per cent. take opium, 20,324.
Opium connected with their early military history, 20,789.
Seventy-five or 80 per cent. of men, 50 per cent. of women, take opium, 20,698.
Ten per cent. of the Rajputs in Ulwar take opium, 20,982.
Forty per cent. of men, 20 per cent. of women and 12 or 15 per cent. of children, take opium, 20,990.
Take opium in four forms, *ib.*
Fifteen per cent. of males habitual, 30 or 35 per cent. occasional, consumers, 21,125,
Use of opium increasing, 21,581.
Alleged burdensome treaties with British Government, 21,811, 21,823, 21,824.
Wealthier classes drink amal pani or kasumbha, 21,945.
Eighty per cent. use opium, 22,290.
Vast majority moderate consumers, 22,654.
Are an indolent race, but not through opium, *ib.*, 22,680.
Opium a necessity of life with almost all Girasias, 22,688, 22,696, 22,705–12.
Alleged ill-effects of habit not visible, 22,692.
Less than one-eighth take enough to affect health, *ib.*, 22,745.
Girasias among the largest consumers, 22,802.
Use of opium prevalent, 22,828, 22,869.
Opium specially prized, 23,048.

RAJPUTS—*continued.*

Use of opium considered fashionable, 23,104.
Thakurs taking to drink instead of opium, 24,018–29.
Using alcohol in place of opium, with frightful results, 25,990.
Extensively addicted to opium; a fine race, 28,016.
Morally, no way inferior to non-eaters, *ib.*
Accustomed to use of opium over 200 years ago, i. 133.
Many sturdy Rajputs take opium, and are none the worse, i. 142, 143.
Moderate use general: no deterioration perceptible, iv. 380.

*See also* CEREMONIAL USE, SOCIAL USE.

RAMPUR:

Poppy-growing prohibited to prevent complaints of smuggling in neighbouring British districts, 19,677, 19,680.
Rampur State could not afford to lose opium revenue, 19,678.
Ten per cent. of the city population smoke chandu, 19,708.

*See also* NATIVE STATES.

RATHORS:

Col. Tod's view of debasing effect of opium incorrect, 20,294–99.
Extensively addicted to opium; a fine race, 28,016.
Morally no way inferior to non-eaters, *ib.*

REGISTRATION OF HABITUAL CONSUMERS:

Register of habitual consumers should be kept, 708, 741.
Registration on the Burmese system recommended, 2528, 2558, 2559, 13,195, 13,289, 13,291, 14,009, 18,207.
Present consumers should be registered, 2649–51.
System might be devised to suit habitual consumers, 2528.
Burmese system, *ib.* 2558, 2559.
Habitual consumers should be known to vendor, 4341.
Useful, as exposure produces deterrent effect upon consumers, 9056.
Habitual consumers should be registered, 11,694.
Burmese system of registration should be made general, 12,666.
Vendors should have lists of habitual opium-eaters, 12,819.
District civil surgeons should have register of consumers, 13,035.
Registration of habitual consumers not objectionable, 14,434.
Consumers would object, 15,674.
A necessary consequence of prohibition, 16,024.
Undesirable; habit should be stopped, 16,571.
Public opinion would favour its adoption, 16,690, 16,725–34.
Should be applied only to excessive consumers, 16,727.
Would cause as much trouble as rules for cultivation, 17,854.
Best course under the circumstances, 17,912.
Would induce respectable persons to give up the habit, 17,913.
Consumers would be likely to object, 18,369, 18,397.
Consumers should be licensed by Government, 18,571, 18,927, 18,963.
Habitual consumers, and the quantity they take, should be registered, 19,001, 19,029.
Desirable to make provision for habitual consumers, 19,066.
System adopted in Burma warmly commended, 23,309.
Arrangements should be made to prevent future contraction of habit as a luxury, 23,914–18.
Desirable to allow consumers to register, 24,301.
Names of consumers, and quantity taken, should be entered in Government register, 24,543.
Habitual consumers over 40 should be registered, 27,282*b*.

*See also* BURMA—REGISTRATION.

RELIGIOUS OBJECTIONS:

Buddhist law forbids use of intoxicants, 294, 369.
Smoking opium against the Buddhist religion, 662.
Not forbidden by the Shastras, or Koran, 2757.

RELIGIOUS OBJECTIONS—*continued.*

People take opium, though prohibited, 3151.
Opium the only "excise" article a good Mahomedan can use, 3185, 3197.
Religious, i.e. caste, prejudice sometimes a ground for refusing to grow poppy, 5297, 5322.
Prohibited by the laws of Buddha, 6682, 6964, 6969–75.
Condemned by Buddha and Confucius, 7302.
Buddhist Church opposed to opium traffic, 7581–84.
Panthè religion forbids the smoking of opium, 7692, 7699–701.
Burmese people regard use of opium as an offence, 7983.
Use of alcohol and opium not only a sin, but a crime for the Burmese, 8013.
Not forbidden by the Koran or Mahomedan law, 8459–62.
Difference of opinion among Mauvalis as to prohibition of opium by the Koran, 8771–78.
No religious Hindu will take opium, 9465.
Said to be forbidden to Mahomedans, 9466.
Assamese religion more stringent against alcohol than opium, 10,028–35.
Nothing positive against opium in the Shastras, 10,035.
Prohibited among the disciples of Dehing Gossain, 10,511, 10,593.
Religious Mahomedans object to any form of indulgence, 12,594.
Intoxicants forbidden, but opium in moderate doses does not come under that category, 13,418, 13,425–29.
Opium said to be prohibited in the Shastras, 14,558, 14,559; not mentioned, 14,560–67.
No religious question to face with regard to opium, 14,881–87.
Opium not prohibited by the Hadis, 16,238–41, 16,251, 16,252, 26,820.
Opium for luxurious purposes prohibited by Mahomedan religion, 17,004.
Opium not prohibited by the Sikh religion, 17,656, 17,678.
Post only forbidden in excess, 17,846–48.
Opium not expressly prohibited by the Mahomedan religion, 17,924–28, 19,692–707.
Not sanctioned by the Vedic and Puranic religions, 18,108, 18,114–18.
Mahomedan religion against all sorts of intoxicants; Hindu, though silent, never encourages, 18,210.
Opium forbidden by Mahomedan religion, both as an intoxicant and poison, 19,041.
Opium introduced after Koran was revealed, 19,044.
Included in intoxicants, although not named, 19,045, 19,053–65.
Not lawful as a medicine, except when prescribed by doctors, 19,045–51.
Poppy-growing distasteful to certain castes, 19,313, 19,467.
Opium allowed for children and patients by Mahomedan religion, 19,838–43.
Hindus and Mohomedans consume opium without religious restriction, 19,885.
Not prohibited by religion of Hindus, Jains and Mohomedans, 20,172.
Only contrary to Mahomedan religion as an intoxicant, 20,285.
Narcotics forbidden by the Koran, 21,454.
Mahomedans do not seem to extend the prohibition to opium, 21,455, 21,462.
Opium not condemned by any Shastra, 22,167, 22,176.
No caste or creed restrictions, 22,357, 22,385.
Opium necessary to certain religious rites, 22,385, 22,426, 22,428, 22,638.
Opium not prohibited by Hindu religion, 23,764, 24,905.
Not being a real intoxicant, does not come under religious prohibition, 24,114.
Opium not strictly prohibited by Hindu religion, 24,389, 24,363, 24,514.
No religious or caste feeling against moderate use, 24,566.
Forbidden to the Swámi Náráyan Sect, *ib.*
Opium forbidden by Hindu Shastras, 24,622.
Opium does not defile as forbidden food, 24,860.
Opium not expressly prohibited in the Koran, 24,984.
No hard-and-fast rule among the Sunni community, 24,994.
Orthodox Mahomedans take opium in moderation, 25,240.

RELIGIOUS OBJECTIONS—*continued.*

Nothing particular mentioned about opium in the Koran, 25,243.
Excessive use affecting reason forbidden, 26,823.
Not denounced in the Shastras, as opium was not in existence when they were written, 26,892, 26,910.
Some religious persons will not go to English doctors because they prescribe spirits, but use opium freely, 26,914–17; orthodoxy much slacker nowadays with regard to use of alcohol, 27,594.
Burmese religion specifically denounces opium, ii. 538, 544, 592.
Opium strictly forbidden by Buddhist scripture, ii. 560.
Appears to be prohibited to Musalmans as an intoxicant, iv. 379.
Caste rules as regards opium, ganja, alcohol, &c., iv. 380.

*See also* NATIVE CHURCHES.

RENI:

Refined form of opium used in Kathiawar, v. 124.

RENT:

Landlords not always bound to reduce if poppy-growing discontinued, 5305–10.
Land would not fetch so much if cultivation stopped, 5332, 5333.
Prohibition would not affect rate of rent, 5567–70.
Prohibition would reduce rents, 6095–101, 6271–74, 8498, 8499.
Reduction can be claimed on ceasing to grow poppy, 6129, 6152, 6171–85.
Behar tenancy laws give no claim to reduction if opium prohibited, 8513–15.
Paid in kind in South Behar; cash payment preferable, 10,897, 10,898.
Higher rate formerly obtained for opium lands, 10,910.
Different rates for different crops, 10,952–55.
Advances for poppy make realisation easy, 10,956–61, 10,965.
Rent of opium and other land, 11,251–58.
Fixed according to quality of land, 11,263–67.
Rack-renting in Behar, 11,308–10.
Fixed for opium land and paid in money, 11,420–23.
Rate for opium lands higher in Behar than for cereals, 11,905, 11,909, 11,917.
Increased price of opium would not result in higher rents, 12,064, 12,065.
Varies in Oudh according to quality of land, 12,538–43.
Poppy crop cannot be attached for rent or debts in N.W. Provinces, 12,754, 12,777–79
Rates higher for opium lands in N.W. Provinces, 12,861, 12,887–91.
Poppy lands charged higher rate in N.W. Provinces, 12,966–69.
Fixed according to quality of land in North-western Provinces, 13,256, 13,257.
Specially prepared opium lands fetch high rent, 13,445.
Rent of land held by tenants at will would fall if opium prohibited, 13,508.
Rents would fall in Lucknow districts if poppy cultivation prohibited, 13,694, 13,721, 13,724.
Muraos in Oudh pay higher rent for their poppy land than other cultivators, 14,363–65.
To some extent fixed with reference to soil in N.W. Provinces, 14,395–97.
Poppy cultivation enhances value of land in N.W. Provinces, 19,311, 19,457–59.
Advances enable cultivators to pay promptly, 19,312.
Not always reduced when crop changed, 19,313, 19,338.
Rents and land revenue in N.W. Provinces would have to be revised if poppy discontinued, 19,538.
Per-centage of area and rental, 19,539.
Rents in N.W. Provinces would be reduced if poppy prohibited, 19,655–64.
High rents for opium land tend to decrease cultivation in Indore, 23,475–85.

*See also* ADVANCES, CULTIVATION, *and the various Native States.*

RESERVE OF OPIUM:

Sales limited to create reserve stock against bad seasons, i. 134.

RESTORATIVE:
Opium taken by a number of people with effects similar to tobacco, 12,612, 12,617–20.
Value of opium to Natives of India, 14,310, 14,313–24.
Popular opinion not in accordance with fact, 17,947.
Not prescribed by physicians, but by illiterate villagers and such people, 17,996.
Natives believe opium supplies vital energy, 21,298.
Very few middle-aged men use opium as a restorative, 26,906.
*See also* OLD AGE.

RESTRICTIVE MEASURES:
No change in existing system recommended, 1614, 4448, 18,633–36, 26,261, 28,051*a*.
Any mode short of prohibition is impracticable, 8651.
Should be increased to reduce consumption, 12,955.
Good effects of restriction, 16,094–96.
No necessity for further restrictive measures, 22,764, 22,788, 22,835, 22,869.
Greater facility in procuring alcohol than opium, 23,770.
Opium should be made so dear as to be out of the reach of the people, 24,308.
Present measures are sufficient, 24,408.
No change in existing arrangements necessary, 24,517.
Facilities for getting opium should be decreased, 24,543–45.
Present system as nearly perfect as possible, 24,578.
Difficulties attending alteration of present system, 24,813.
Additional prohibitive measures unnecessary, 26,027, 26,049, 26,064.
Present system serves the purpose, 26,411.
People would not consent to further restrictions, 26,653.
Sale should be restricted to smaller quantities, 27,143–46.
Should be sold as poison sold in England, 27,218–21, 27,236–55.
Lessening number of shops has no effect on consumption, 27,312.
Further restrictions on retail vend should be imposed, 27,472.
Opium cannot be obtained in London as readily as at Indian bazaars, 27,511, 27,519–31, 27,546–52, 27,560–63.
Measures should be kept as hitherto, 27,597.
Increased price would be objected to by consumers, 28,070.
*See also* BENGAL SYSTEM, LICENSING, PROHIBITION, SALE.

RETREATS:
Should be provided for habitual excessive users, ii. 548.

REUNION:
Indian opium imported, 1869–70 to 1892–93, ii. 335, 390.

REVENUE:
Revenue from the opium export trade, 18, 2111–15.
Opium revenue some years ago was Rx. 8,500,000; greatly diminished through increase of cultivation in China, 892.
Now estimated at Rx. 5,750,000, 893, 894, 933–35.
Practical objections to prohibition of opium, 909.
General revenue increasing, 910–13; expenditure increasing in same ratio, 914–16.
Opium revenue the most unobjectionable part of Indian revenue, 1561.
Opium income is exceedingly precarious, 1778.
Indian opium revenue, 2058, 6009–11.
Opium regarded as source of revenue, 2104–10, 2129–32.
Duty from Native states, 2532, 2533.
Opium revenue in N.W. Provinces and Punjab, 2757.
Increased by issuing licenses by auction, 4807.
Revenue from madak and chandu in Bengal, 4942–48.
Receipts from licenses for chandu and madak shops 5009.
Sensible reduction during the past ten years, 5106, 5107

REVENUE—*continued.*
Revenue is decreasing, 11,017.
Tremendous rate of increase during last few years, 16,644–51.
Paid out of profits of opium cultivation in some districts, 18,164.
Development does not show increased consumption, but better administration, 19,523.
Estimated loss of revenue through prohibition, 24,909, 26,701, 26,847.
Revenue realised but a part of pecuniary value of poppy crop, i. 133.
Increase due to prevention of smuggling, increasing population, increasing prosperity, i. 142,
Opium revenue and expenditure, 1880–81 to 1893–94, ii. 342, 343; explanation of columns in statement, ii. 344.
Receipts from license fees and duty, 1883–84 to 1892–93, ii. 347–54.
Revenue from license fees and opium duty, 1873–74 to 1892–93, ii. 428, 429.
Receipts from opium, 1882–83 to 1891–92, ii. 447.
Per-centage of opium to general revenue, ii. 449.
*See also* COMPENSATION, FINANCE, PROHIBITION, TAXATION.

REWA:
Consumption in Rewa varies from 2·27 to 90 per cent. in different districts, 22,010.
Monopoly practically same system in Rewa as in Bengal, 22,080, 22,110.
Retail price in Rewa raised to stop smuggling into British territory, 22,082, 22,143.
Estimated loss of revenue to State, and profit to cultivators, 22,097.
Consumption exceptional in Rewa, 22,113.
Arrangements regarding opium, ii. 356.
Quantity imported for home consumption, 1891–92, *ib.*
Text of agreements now in force, ii. 364.
*See also* NATIVE STATES.

ROHILLAS:
Opium-eaters; amongst the most warlike races of India, 4417.

RUBBA OPIUM:
Manufactured from crude opium adhering to bags, 22,203.

RUNGPORE:
Consumption of opium, 9250–52.

RUTLAM:
Estimated loss to State, cultivators and traders through prohibition, 23,210–26.
Average annual export, 23,227.
Production of opium, 23,229.
Statistics regarding opium, iv. 408.
Return of opium passed the scales, 1878–79 to 1892–93, iv. 415–17.
*See also* NATIVE STATES.

## S.

SAILANA:
Estimated loss to the State through prohibition, 23,242–60, 23,287, iv. 407.
Forty or fifty per cent. of population use opium, 23,279, 23,288.
Statistics regarding opium, iv. 408.
*See also* NATIVE STATES.

SALE:
Disposition to restrict local sale, 16, 17.
Objections to the farming system, 2541–52.
Should be sold only on medical certificate, 2673–78, 3060–62, 3524–27.
Restriction of unlicensed sale desirable, 3634–38.
Necessary to restrict free sale, 3894, 3914–16.
Restriction should be placed on sales, 3983–89.
Regulations should be more stringent, 4057, 4347–49.
Should be sold like poison, 4063–65, 15,108–12, 15,124–26, 15,129, 15,130, 15,535–44, 15,562–68.

SALE—*continued.*

Should be sold for medical purposes only, 4082–95, 4102–8, 4720.
Facilities for obtaining opium are excessive, 4293.
Not the slightest necessity for further restriction, 4425.
Should be sold in non-poisonous doses to registered customers, 4330–52, 4376–79.
Should be under strictest limits and safeguards, 4718.
Further restrictions, unattended with increased expenditure, would be welcome, 5331.
Should be prohibited except for medical purposes, 5844, 5847–49, 5916–18, 18,305, 18,330.
Should be some sort of restriction on licensed sale, 5990, 6012–14.
Sale of chandu and madak should be prohibited, 6399, 6400.
Open sale would tend to increased use, 6426.
Should be under police regulations, 6435–38, 6441–47.
Should be under same restrictions as poison, and sold under medical prescription, 7803–10, 10,393, 10,495, 13,115, 13,127–39, 13,147–55, 13,217–19.
Should be marked "poison" and sold for medicinal use only, 11,449.
Retail sale by the Government, 14,826.
Public sale of chandu and madak should be prohibited, 15,156, 15,170–73.
Licenses for sale of madak and chandu discontinued in the Punjab, 15,713.
Facilities for purchase do not need reducing, 16,909.
Sale to young people should be prohibited except on medical advice, 18,932.
Present system tempts consumers, 18,962.
Should be prohibited, except in small quantities or for medical use, 19,004, 19,029.
Should not be sold without certificate from recognised medical practitioners, 19,066, 19,077.
Sale in large quantities should be prohibited, 19,085, 19,089.
Sale of provision opium, ii. 322.
History of sale of opium in Bengal, ii. 425.
System in force in Lower Bengal, ii. 427–35.

—— ILLICIT:

Cultivators keep back a little opium, 3007–9, 15,388, 15,409–11.
Cultivators keep back opium and sell it illicitly, 13,796–98, 13,867, 13,935, 13,951.
Great deal of opium kept back by cultivators and sold, 14,829.
Fluctuates with the restriction or increase in consumption of Government opium, 19,113.
*See also* SMUGGLING.

SALES:

Monthly auction sales, 2929.
System of monthly auction sales, 2582–85.
Bengal sales considerably less than ten years ago, 5108.
Return of sales at sub-treasuries, valuable check on illicit sales, 5123–25.
Taxation of sales, 5149–51.
Sold by auction; Government cannot fix the price. 12,393.
Bengal sales, 1880–81 to 1893–94, ii. 342.
Auction sales in Calcutta, 1883–84 to 1892–93, ii. 346.
Gain on sale proceeds of excise opium, 1880–81 to 1893–94, ii. 342.
Receipts from sale in licensed shops, 1883–84 to 1892–93, ii. 348–54.

SALT:

*See* PRECEDENTS.

SATARA JAGIRS:

Arrangements regarding opium, ii. 356.
*See also* NATIVE STATES.

SAYLA:

Consumption of opium, 23,947.
*See also* NATIVE STATES.

SCORPION STING:

Belief that consumers suffer less from scorpion sting, 22,579.

SEDATIVE:

Opium only real sedative known to Burmese, 6690.
May have soothing effect after exceptional fatigue, 11,857.
Toxic properties are calmative and palliative, 22,385.
Opium intoxication very mild and sedative, 23,657.
Taken to calm and sooth the nervous system, 23,874.
*See also* STIMULANT.

SEXUAL EFFECTS:

Smoking seriously affects the generative system, 389.
Habitual use has a marked tendency to diminish the reproductive power, 1154.
Effect on the sexual passions, 1165, 1166.
Opium leads to immorality, 2327, 2328.
Possesses an aphrodisiac power, at least for some time, 4639.
Use of the drug for sexual pleasures, 6327, 6334, 6362, 6368–72.
Ultimately followed by impotence, 6363.
Impotence, effect of long consumption, 8227.
General belief that opium increases virile power, 8601.
Opium used to increase sexual appetite, 8637, 8729.
Habitual eaters become impotent. 8641, 11,816, 11,845, 12,659, 16,775.
Opium has made "man woman, and woman man," 9043.
Opium prolongs period of sexual intercourse, 10,727, 13,013, 13,325–34, 14,424, 14,687, 14,723, 14,724, 18,027, 18,055, 21,418, 23,382, 24,119, 26,436, 26,542.
Opium taken to stimulate sexual passion, 12,654, 12,674, 12,675.
Sexual vigour increased in early stage of habit, 13,191.
Constant use impairs the natural powers, 15,490.
Causes partial or total impotency, 15,147.
Eighty per cent. take opium for immoral purposes, 15,672.
Gives sensual pleasure at first, but leads to impotence, 17,996.
Used in order to produce lust, 18,612.
Impotency brought on by excessive use, 19,777.
Does not increase sexual appetite, 20,286.
Believed to delay seminal emission, especially if taken with milk, *ib.*
Opium certainly does not increase sensuality, 20,282.
Impotence generally follows the opium habit, 21,298, 23,457.
Excessive use of amal pani produces sterility, 21,945.
Prostitutes use drug as a physical stimulant, 22,579.
Taken for aphrodisiac purposes, but has contrary effects, 23,688.
Used by ascetics to allay sexual appetite, 25,310.
Moderate consumers as fruitful as others, 25,400.
Immoderate use leads to impotency, 26,427, 26,436.
Smoking habitually for a year or two causes sterility, 26,542.
Sixty-five out of 70 people questioned use opium to increase sexual endurance, *ib.*
Opium permits abnormal sexual indulgence, 26,586.
Smoking does not cause sterility, 27,095–97.
Excessive use produces impotence and sterility, 27,203.
Use for causing sexual endurance unheard of until lately, 27,462.
Extracts from evidence by women in New South Wales on effect of opium on sexual passions, i. 167, 168.
Opium deadens sexual desire, ii. 317.
Desire increased at first, afterwards followed by "endurance," and often ultimately by impotence, ii. 415.
Prolonged excessive use weakens procreative powers, ii. 437.
Impairs and destroys procreative power, ii. 544.
Excessive use of opium impairs the sexual power, iv. 380.

SHAHPURA:

Statement with reference to poppy cultivation, 21,699.
Poppy rates collected in cash, 21,701–17.
Views of H.H. the Raja on prohibition, 21,718.
Prohibition would not be legally applicable to the State, 21,724.
Exports to Bombay, 21,734.

SHAHPURA—*continued.*

Loss to the State and individuals through prohibition 21,738.
Export into British territory, 21,739–45.
Statistics of poppy cultivation and opium consumption, iv. 395.
Estimated loss to the State, &c., if cultivation prohibited, iv. 396.

*See also* NATIVE STATES.

SHAN OPIUM:

Readily distinguishable from Government opium, 7598.

SHANS:

Facts observed with reference to consumption of opium, ii. 524.
Extent of consumption, *ib.*
Effects on their physical and moral faculties, *ib.*

*See also* BURMANS.

SHOPS:

Closing shops for consumption on premises has increased the number of private clubs, 2271.
Government keeps the number at lowest, 4525.
Licensed smoking shops had advantage of being under police supervision, 5471, 5481–87, 5498, 5499.
Smoking prohibited on licensed premises, 8616, 8644.
Practically carried on as before by hire of adjoining houses, 8617–19, 8645, 9329, 9371–76.
Chandu houses should be closed altogether, 8620, 8621.
Chandu and madak shops should be closed, except where there is a Chinese population, 10,790.
Habit has grown notwithstanding reduction in shops, 14,976, 14,977, 14,981–89.
Closing of licensed shops has led to practice in private houses, 24,580, 24,581.
Number licensed for retail sale, 1883–84 to 1892–93, ii. 347–54.
Number of licensed shops, 1883–84 to 1892–93, ii. 348–54.

*See also under the various Provinces.*

SIAM:

Consumption of opium, 5371.
Smuggling into Burma, 8367, ii. 501.

SIKHS:

One of the finest races physically in all India; almost invariably habitual consumers of opium, 872, 897–99, 927.
Prohibition of tobacco and deprecation of alcohol may have induced the Sikhs to take opium, 1098.
Very hardy race; take more opium than most people without injury, 1559, 1595, 1596.
Took to opium, hemp, and alcohol, tobacco being prohibited by their religion, 1559.
Were hard drinkers before English came to India, *ib.*
Largest consumers of opium; sturdiest people in the country, 2706.
Opium served out to Sikh troops, 3318, 3374–83.
Considerable proportion take opium habitually, 3405.
Opium eaters—amongst the most warlike races of India, 4417.
Many of them habitual opium eaters, 5169.
Opium taken from 40 to 45 years of age, 6040.
70 or 80 per cent. take it, 6047, 6057.
Opium does not appear to have affected the race, 6834, 6844.
Physical degeneration due to opium observed among Sikhs in Calcutta, 8805, 8874–84.
50 per cent. of Sikh soldiers use opium, 12,901.
Habit common among the martial races, 13,863, 13,864, 13,876.
Native soldiers take opium habitually, 14,117, 14,123, 14,181, 14,192.
Soldiers never fail for want of opium, 14,137, 14,138.
Most stalwart race and one of the most manly, notwithstanding opium habit, 14,306.
A fine race, notwithstanding prevalence of opium habit, 14,226,
Opium-eating in moderation a prevailing habit, 15,698.
Malwai Jat-Sikhs—finest race in the Punjab, and most addicted to opium, 15,738–43.

SIKHS—*continued.*

Prohibited from smoking by religion, 15,765, 15,903.
Would take to alcohol and hemp drugs if opium prohibited, 15,847.
Habit not considered disreputable, 16,025.
Largest consumers, 16,004.
All use opium, 16,064.
Military services prove that moderate consumption does not demoralise, 16,219.
Opium connected with their early military history, 16,345.
Sikhs, especially men in service, commonly use opium, 16,467–75.
Opium is deteriorating the race, 16,730, 16,734.
Drinking is on the increase, 16,742.
Do not smoke opium in any form, 17,131, 17,153.
Used almost universally, 17,151.
Show no appearance of being affected by opium, 17,153, 17,199–203.
Opium consumption among the Punjab Sikhs, 17,235–41, 17,332, 17,354, 17,360.
60 per cent. of Sikhs over 40 use opium, 17,248.
Opium habit among the Sikhs, 17,648–75.
Custom of drinking post used to be prevalent, 17,830.
Generally worn out at 40 through opium, 17,996, 18,020.
Only the non-labouring classes use opium, 18,265.
Show greater agricultural skill than Mahomedans, 18,407.
Almost all Sikh soldiers take opium, 18,410–15.
Moderate use of great benefit to Sikh peasantry, 18,423.
Begin the habit at age of 35 to 40, 18,468.
Larger number over 40 or 50, 18,471.
Quite half of male adults over 40 take opium, 18,474.
No better-behaved soldier than the Sikhs, 18,653.
Use opium only to keep up health, 19,214.
Women and children occasionally eat opium, 21,439.
Occasional taking of small doses very common, 21,959, 21,973.
Almost all infantry, rather less cavalry, eat opium, 22,009.
Opium regarded as a harmless stimulant, substitute for tobacco, *ib.*
Habitually use opium, yet are best soldiers in India, 27,567.
Hyderabad soldiers and police regular opium consumers, 27,912–14.
Extensively addicted to opium; a fine race, 28,016.
Morally no way inferior to non-eaters, *ib.*
Discontent through prohibition would constitute a serious political danger, i. 143.

*See also* NATIVE SOLDIERS.

SIND:

Smoking shops closed, 18,525, 18,527–33.
Consumption of opium, 18,526, 18,564.
Unlicensed possession the technical offence of suppressed smoking shops. 18,528–31, 18,545, 18,555.
Suppression a mistake; shops should be licensed and under control of police, 18,532, 18,553.
Increased consumption chiefly due to increase of population, 18,566–68.
Effects on the physical condition of Sindhis not good, 18,569.
Opium excise arrangements, 18,572–76.

SIROHI:

Particulars of the opium trade, 21,187–216.

*See also* NATIVE STATES.

SMOKING:

Description of the process, 373, 26,040, ii. 614.
Morphia not absorbed in process of smoking; other alkaloids may be, 837–45.
Decomposition of morphia in the pipe, 1157–61, 1671.
Description of the Chinese method, 1693–98, 27,789.
Description of the opium pipe, 2593.

SMOKING—*continued.*

Madak and chandu - smoking compared, 3510, 3543–48, 3795, 5002–3, 6331–39.
Madak and chandu used by very low class, 5983, 5894.
Chandu-smoking practised by low and degraded people, 13,764, 13,794, 13,795, 16,012.
Has been introduced within the last 40 years, 16,220.
Reports on opium-smoking dens, ii. 608–24.
Petition from Bombay opium-smokers in favour of practice, iv. 373.
History of smoking in the North-west Provinces, v. 87–89.
Chinese almost invariably smoke, v. 149, 154–342 (par. 4).
Extract on opium-smoking, v. 326–29.

Much more deleterious than eating or drinking opium in India, 2761, 2762, 23,309, 23,333, 26,317, 27,179.
Far more injurious than eating, 3842–50, 20,047, 20,089, 28,106, 28,142.
Effects worse than those of eating, 3897–900, 8822, 18,296, 19,285, ii. 412, 414, 415.
Gives more prolonged pleasure than eating, 7435.
Generally considered more hurtful than eating, 9959.
Radical difference between smoking and eating, 16,904.
Physique of chandu-smokers worse than of eaters, 18,763.
Harmful; much more opium used than by eating; leads to loss of time, 22,033.
Considered more deleterious than eating, 26,518.
Madak more injurious than eating, 27,570, 27,576, 27,597, 27,606–18.
Smokers more susceptible to sickness than eaters, ii. 552.
Smoking less noxious than eating, ii. 627.

Opium-smoking not generally injurious, 902, 1168–70, 1174, 28,064.
Opium-smoking quite innocuous, 1156, 1168–70, 1174.
Moderate use, with rare exception, produces no injury, 1280.
Excess must have a weakening effect on the system, *ib.*
Evil effects of smoking exaggerated, *ib.*, i. 139; physique of Chinese very good, 1281.
Opium has no deleterious effect; quite the contrary, 1637.
Not particularly injurious in moderation, 1641.
Effects not at all evident, 1726, 1733.
Not recommended, 4076.
Does not appear to do much harm, 5985.
Habit leads to great waste of time, 7406.
Has a soporific rather than stimulant effect, 15,946.
No harm results from moderate use, except to chandu-smokers, 24,426.
Does less organic injury than tobacco-smoking, 24,861.
Moderate quantities do no harm; excessive use rare in China, 25,037–40.
Moderate consumption not at all injurious, 25,193.
Chandu has nothing to do with smokers being haggard or emaciated, 25,658.
Evil results of smoking not sufficient to justify prohibition of sale of opium-smoking compounds, 26,992–98.
Evil effects of smoking usually aggravated by liquor, bhang, or starvation, 27,100–4.
"Lives of Bombay opium-smokers," 27,104–9, iv. 485–95.
Madak smoking condemned simply because habit chiefly confined to lower classes, 27,572, 27,582.
May be useful in pulmonary complaints, in moderation, 28,163.
Difficult to say whether emaciation of madak-smokers due to debauchery and use of bhang, &c., or solely to madak, 28,164–66.
Opium-smoking, as practised in China, is perfectly innocuous, i. 139.
Descriptions of effects on health overdrawn and misleading, i. 142.
No injurious results visible on the mass of the people, ii. 316.
Evil effects of smoking much over-rated, ii. 412.
Common idea that victims die of emaciation erroneous, ii. 523.
Evil effects more perceptible if indulgence unaccompanied with good food, *ib.*
Poppy [illegible] in Shan States usually smoke heavily without evil results, *ib.*

Harmful effects cannot easily be overstated, 64–71.

SMOKING—*continued.*

Prejudicial to work, 177; tendency to excess, 178, 209, 210; results only in evil, 179, 207.
Evil effects sometimes eight or ten years developing, 364.
Only 10 per cent. of opium-smokers can do a fair day's work, 420.
Opinions of missionaries as to effects of habit in China, 432, 453–62, 503–36.
Impossible to exaggerate the evils of smoking, 624.
Most destructive, morally and physically, 643.
Opium-smokers more liable to diseases than others, 858.
Letter from a native Evangelist describing evil effects of opium, 1513.
Smoking occasionally, but very rarely, affects the health, 1637.
Costs China half to three-quarters of a million lires every year, 1877, 1878, 1883.
Effect upon general health unfavourable, 1883.
Fumes affect persons other than actual smokers, 1886–88.
Opium cannot be taken with impunity, 1985–87, 2000.
Opium-smoking population generally unhealthy, 2001–4.
Effects not so great on well-fed people, 4680, 4681.
Chandu and madak-smoking distinctly harmful, 4975–77.
Smoking is deleterious in all cases, 4990, 5000–4.
Effects of the habit, 7003–21, 7030–49.
From 30 to 60 per cent. of smokers become unfit for work, 7011–14, 7030–34.
No clear difference between moderate and excessive smoking, 7400.
Evil effects of chandu and madat partly due to bad nourishment, and habit of smoking dirty pipes, 11,896.
Chandu and madak-smoking injurious, 12,851, 12,852.
Bad effects chiefly due to smoking, 14,906.
Smoking impairs the physical and moral sense, 15,146, 15,151.
Smoking injurious, even in moderation, 16,009, 16,688.
Chandu and madak cause grave injury, 17,422, 26,806.
Madak and chandu-smoking especially ruinous, 18,282.
In China, a harmless habit; in India, a degrading vice, 18,536–44.
Chandu-smoking a most hurtful practice, 19,128–30, 19,145, 21,812, 21,829, 21,870.
Is an evil in moderation, 20,180.
Belief in prolonging life of consumptives, erroneous, 21,375.
Most injurious form of consumption, 24,117, 24,168.
Madak-smoking very injurious, 25,289–93, 27,388, 27,645, 28,142, 28,151.
Excessive use of madak generally proves fatal, 25,299.
Skilful use of madak not objectionable, 25,315.
Smoking is very deleterious unless accompanied with good food, 25,522.
Effects more rapid from concentrated form in which taken, 25,956.
Undesirable morally and physically, 27,606.
Has a deleterious effect upon the nervous system, 27,885.
Produces very undesirable results, 28,016.
Very injurious, especially to old persons, 28,124.
Practice destructive to those who live in poverty, ii., 316.

Should be stopped altogether, 3057, 14,416.
Prohibition in licensed shops leads to worse evil, 5471.
Restrictive measures necessary, 6194, 6266.
Should be prohibited in private houses, 13,786; would be difficult, 14,428–31.
Chandu and madak shops should be closed if possible, 14,463–66.
If made penal, smoking for pleasure would be rooted out, 15,531–34.
Madak and chandu smoking strongly discouraged in the Punjab, 15,713.
Should only be allowed in private houses, 18,203, 18,230–35.
Policy of Government always distinctly repressive, 19,524, 19,590–92.
Keeping public smoking saloons should be punishable, 19,566, 19,570.

SMOKING—*continued.*

Chandu very pernicious; should be stopped, 19,675.
Chandu and madak are the worst forms of opium; should be stopped, 19,749, 19,757, 19,777, 19,820.
Prohibited in Dholpur State, 21,655, 21,664, 21,688–97; in some States of C. India, 21,812, 21,829, 21,870; penal offence in Gwalior and Indore, 21,870, 22,084; discouraged in Rutlam and Jaora, 21,870; penal in Baroda State, 22,496, 22,533–39; in Dewas State, 23,061.
Madak-smoking is dangerous; should be prohibited; 25,478, 25,484–87, 25,513, 28,124, 28,131.
Consumers anxious to see smoking prohibited, in view of benefit to rising generation, 26,436, 26,540, 26,544, 26,586.
Should be entirely prohibited, 27,597, 27,610.
Desirable to stop smoking, 28,018.
Greater restrictions should be placed on madak-smoking, 28,134.
Should be prohibited, 28,149–57.

*See also* DENS, EATING, EFFECTS, MENTAL, MORAL, PHYSICAL, AND SEXUAL EFFECTS, POPULAR VIEW OF HABIT, PREVALENCE, SOCIAL USE.

SMUGGLING:

Higher duty would encourage smuggling, 782. 2065–67, 2077.
Prevention would be beyond resources of Government if export prohibited, 2082, 2083.
Licensed vendors in Bombay purchase smuggled opium, 2431.
Prohibition would not increase illicit traffic, 2468.
Prohibition would increase smuggling from Native States, 2709.
Preventive measures necessary if opium prohibited, 2931.
Doubtful whether much exists, 3009.
Price kept down through fear of smuggling, 3206–8.
Smuggling from Chittagong into Burma, 3237.
Easily effected in small quantities, 3416, 13,687.
Total prohibition would be neutralised by smuggling, 3666.
Would render prohibitive measures ineffectual, 3799.
Prohibition would entail a very large preventive establishment, 4981.
Would be encouraged by higher price, 5064–68.
Prohibition would be a great incentive to smuggling from Nepal, 5510, 5512.
Smuggling by Nagas, 5619–26.
Prohibition would lead to increase, 6043, 8500.
Impossible to prevent smuggling from Nepal if cultivation prohibited, 10,788.
High price encourages smuggling, 12,955, 12,956.
Impossible to prevent smuggling from Nepal, 13,869–75.
Impossible to prevent smuggling if opium prohibited, 16,902, 18,150.
Regiment of preventive officers could not stop smuggling, if opium prohibited, 17,341.
Prohibition would be a bounty on opium smuggling, 19,323.
No preventive establishment would keep down smuggling if opium prohibited, 22,385.
Government should adopt proper preventive measures, 22,798, 22,805.
Increased price would not necessarily lead to increased smuggling, 22,805.
Government should be able to stop smuggling, 24,337–39.
Further restrictions would increase smuggling, 24,813.
Not so large as stated by Government, 27,290.
Illicit trade—extensive at present—would be greatly increased by prohibition, 27,469.
Difference in price in Native States and British territory induces smuggling, 27,499.
False charges of smuggling frequently made, 27,500.
Licensed vendors help collectors to detect smuggling, *ib.*
Could not be prevented if cultivation prohibited, i. 143.
Army of preventive men could not guard a Customs' line 2,000 to 3,000 miles long, *ib.*

*See also under* PROHIBITION *and the various Provinces and Native States.*

SMYRNA OPIUM:

Analysis, ii. 405, 406.

SNAKE POISON:

Popular belief that opium-eaters proof against cobra poison, 22,579, 22,584.
Snake poison has little effect on habitual consumers, 24,518, 24,552.
Strychnine said to be an effectual antidote; not sold openly like opium, 26,540.

SOCIAL EFFECTS:

Claims of wife and children unheeded while craving lasts, 226.
Brings consumers to poverty, 758.
Opium habit is starving millions of children, 2253, 2333, 2339–42.
Often leads to poverty, 12,573–75.
Productive of misery and wretchedness among the poor, 18,927, 18,942–55.
Statement that people ruin themselves and starve their children for opium is false, 19,529, 19,550–55.
Effect on family not to be compared with that of drink, 20,282.
Chandu and madak-smokers sometimes cause trouble to their friends through idle habits, *ib.*
No evils affecting society traced to opium, 21,655.
Men wrecked through opium to be found in towns, 22,655.
Men spend money needed for their families on opium, 23,309, 23,315.
Homes broken up through use of opium, 23,429, 23,451.
Statement that men sell their wives and children for opium unfounded, 25,612, 26,083, 26,116, 26,117, 26,129–32.
Sale of wives or daughters to obtain opium unknown, 26,430.
Opium habit increases adultery, 26,586.
Men force their wives to adultery to obtain money for opium, *ib.*
Sale of a wife for the purpose not unknown, *ib.*, 26,600–2.
Sale of a girl for opium, 27,359, 27,369–78.
No social degradation springs from use of opium, 27,462.
Destitution of family through opium habit of wage-earner unknown, 27,696.
Social effects observed in the Straits Settlements and Hong Kong, v. 148, 154–208 (par. 3); in China, v. 212–342 (par. 3).

SOCIAL USE:

Practice of offering opium to guests becoming common in China, 661, 25,026, 25,067.
Amal pani produced after dinner, like wine in this country, 1007.
Use of opium water by the Rajputs, 1582–89.
Chinese dinner parties always finish up with a pipe of opium, 1739.
Smoking usual at Chinese dinners, 2028–31.
Smoking is a social vice, like alcohol, 3510.
Smoking is the social mode of consumption, 7436.
Smoking indulged in by the rich when entertaining friends, 11,682.
Decoction of opium drunk at social functions, 12,565.
Invariably offered to visitors, in Rajputana, 13,843.
Opium taken in company of friends, 15,100.
Chandu and madak-smoking practised in company, 15,144.
Opium used by Rajputs at social meetings, 20,175, 20,604, 20,698, 20,982, 20,990.
Opium generally smoked in parties, 20,180, 20,241.
Long-standing custom of offering opium to friends, 20,937, 20,946, 20,978–80, 20,982, 20,987, 20,988, 20,990, 21,073, 21,082, 21,116.
Habits which sanction use of opium are being given up, 21,338, 21,350–62, 21,380.
Rajputs offer opium to visitors, 21,655.
Necessary act of courtesy to offer opium to guests, 21,812.
Rajputs drink amal pani at parties, 21,961–68.
Leading factor in hospitality to guests among warlike classes, 22,385, 22,496.
Social use by the Kathis, 22,578.
Visitors in Girasia houses take opium with the host, 22,688.
Great decrease in use of opium in social life, 22,776.
Rajputs, Kathis, &c., and well-to-do Kaubis offer kasumbha to guests, 22,892.
Offering kasumbha to guests a time-honoured custom, 23,232.

Social Use—*continued.*

Custom of offering tea instead of opium gaining ground, 23,750, 23,755.
Custom of taking kasumbha is dying out, 24,566–73; partially replaced by liquor, 24,567.
Use of kasumbha at social gatherings, 23,676, 23,682, 23,750, 23,874, 23,981, 24,012, 24,037–43, 24,390, 24,427, 24,453, 24,489, 24,647, 24,659, 24,904.
Necessary to continue the long-standing practice of using opium, 24,498.
Opium indispensable at Rajput social gatherings, 26,408, 26,421.
Opium used socially at Rajputana same as alcohol in England. ii. 407.

*See also* Ceremonial Use.

Society for the Suppression of the Opium Trade:

Evidence of the President, 1–165.
Views on the Bengal and Malwa systems, 463–97.
Abolition of the Indian opium trade advocated, 2534, 2565.
Views not understood by the people of India, 8678, 8701.
Proposals, 10,841, 10,869–72.
Reply of Government of India to Society's memorial, i. 140.
Practical steps advocated, i. 143.
Resolutions passed on 3rd June, 1890, ii. 439; on 21st October, 1881, ii. 440.
Memorial praying that registration be extended to non-Burmans, ii. 488.

*See also* Anti-Opium Movement.

Stimulant.

Consumers can only work while under influence of opium, 360, 364.
Power for work greatly increased by opium, but effect soon wears off, 611, 612.
Moderate use strengthens the system, 1005.
Men carry 50 per cent. more under influence of opium, 2261.
Moderate dose gives sustained energy and vigour, 2706.
Helps men who have to do trying work in bad weather, 2906–9, 20,881–88.
Produced excellent effects as protective against cold and fatigue in the Miranzai Expedition, 3412.
Diminishes tissue waste, and enables a man to do more work, 3422.
At first stage of habit exerts stimulating effect, 3791, 16,902.
Stimulates to a certain extent; not always, 3822.
Opium least injurious of all stimulants, 4080.
Renders labourers capable of prolonged work, 4216.
Stimulating effects a popular fallacy, 4289.
All classes use opium as a stimulant, 4579–82.
A stimulant of no mean order, 4645.
Opium not recommended, 4736.
Chief stimulant in use in Bengal, 4799.
Taken as a stimulant, 4992.
Commenced as a medicine, continued as a stimulant, 5507, 5548–51, 5597–601, 5934–37, 6009.
Kanias sent for when difficult piece of work to be done, 5596, 5644–46.
Beneficial effects during great physical exertion, 5620.
Opium not necessary for hard work, 5839.
Opium gives relief from fatigue, 6872–76.
Affords greater staying power, 7421, 7440.
Is a sedative or stimulant, 8014, 8018.
Chief stimulant and sedative in use by Mahomedans, 8445; only so used, never as a luxury, 8451–55.
Mahomedans occasionally use opium in moderation as a stimulant, 8532–46.
Stimulates the powers and passions of body and mind, 8729.
Only opium-consumers can work better under influence of opium, 9050.
Cannot be depended on, 9327.
Best stimulant Assamese Hindoos can get, 10,476.
Necessary to working-people who are opium-consumers, 10,499.
When habitually taken opium acts as a stimulant, 10,727.
Beneficial stimulant of the poorer population, 11,392, 11,411, 11,412.
Enables the ill-fed to go through hard work, 11,893.
Midway between a stimulant and a tonic, 12,468, 12,479, 12,487.

Stimulant—*continued.*

Acts simply as a stimulant on habitual users, 12,715, 12,718, 12,727.
Working people feel uneasy unless they get their daily dose, 13,029.
Mild stimulant when taken in moderation, 13,684.
Moderate use increases power of endurance, 13,886, 13,887.
Used with benefit by men who have fatiguing work, 14,232.
Necessary to the dweller in the plains, 14,310.
Supposed to enable a man to undergo fatigue, 15,719.
Eating has a more stimulating effect that smoking, 15,946.
Chiefly used to produce exhilaration, 16,450–7, 16,523–27.
Enables consumers to endure exposure and fatigue, 16,467, 16,489, 16,499.
"Stimulant," as opposed to "intoxicant," 16,834–38.
Stimulant dose small, 16,843.
Opium taken as a stimulant rather than anodyne, 16,862.
First stage of effects, 16,902.
Small quantities have a stimulant effect, 17,152.
People consider opium necessary in harvesting, 17,356–59, 17,884.
Keeps off effects of bodily fatigue until time for taking next dose, 17,422.
A godsend to labourers, 17,614.
Useful in long marches, 17,662.
Useful when great exertion is required, 17,824, 17,826, 17,890.
Healthy people do not take opium except as a stimulant, 17,890.
Strengthening for three hours, afterwards produces uneasiness, 18,004, 18,011–13.
Is a stimulant, like whipping a horse, 18,198.
Small dose taken before long journey or hard work, 18,408.
Gives strength for a time, but is followed by prostation, 18,664.
Gives energy, prevents fatigue, and preserves sight, 18,795.
Not recommended as an exhilarant and stimulant, 18,854.
Working men can get through their toil without opium, 19,001, 19,029, 19,034.
Opium used precisely as we use wine or tobacco, 19,249,
Used to sustain energy under exceptional circumstances, 19,316.
Used as a tonic, and in certain seasons of the year 19,647.
Eating stimulates, but effect does not last long 19,675.
Consumers do more work while under influence of opium, 19,914.
Opium-eaters capable of doing more work than others only so long as under influence of drug, 20,047, 20,088.
Necessary for Indians, as liquor is in cold countries, 20,174.
Necessary to the poor vegetarian in India, 20,263.
Hard-working peasants enabled to bear exposure and toil, 20,273.
Drugs and stimulants necessary to vegetarian population, 20,290.
Gives power of endurance, 20,855.
Opium least harmful of stimulants, 21,024.
Camel drivers seldom take opium, 21,340.
Consumers unable to endure fatigue without increasing the dose, 21,383–85, 21,396, 21,412.
Taken as a brain stimulant and exhilarant, 21,443–45.
Opium often taken by palki-bearers before beginning a journey, 21,655.
Of greatest use during Afghan war, 21,782.
Highly beneficial for warding off fatigue, 21,870
Small doses act as a powerful stimulant, 21,943
Promotes endurance of great exertion, 21,986.
Opium prevents physical exhaustion being felt, 22,167.
Mail-bearers and runners occasionally take opium, 22,385.
Body capable of bearing great fatigue under influence, 22,579.
After-effect not so bad as ganja or alcohol, *ib.* 22,598.
Protection against effects of fatigue and cold, 22,665.
Used to give greater staying power, 22,879.

STIMULANT—*continued.*

Preferable as a stimulant to alcohol or ganja, 22,936, 23,018.
Enables people to get through hard work without fatigue, 23,062, 23,104, 23,751, 24,102, 26,022,
Hard workers use opium as a stimulant, 23,261.
Weak people can do more work with opium, 23,333, 23,457.
Consumers can only work while influence lasts, 23,429, 23,457.
Effect is transient; lasts about half-an-hour, 23,791, 23,810.
Labourers use opium to enable them to endure fatigue, 23,864, 23,926, 24,453, 24,497.
Invigorates and sustains physical and mental force, 24,120.
When effect disappears, opium-eaters seem prostrated, 24,543.
Gives vigour in time of war, 24,626.
Beneficial to labourers in alleviating fatigue, 24,628, 24,648.
Enables people to undergo considerable fatigue, 24,727.
Post-runners invariably take opium before starting, 24,904.
Generally used as a kind of tonic, 24,971.
Peculiarly adapted to travellers, 25,284.
Poorly-fed people use opium as an invigorator, 25,583.
Gives mental as well as physical energy, 25,797.
At first stimulates the nervous system, afterwards produces sleep, 25,825.
Influence lasts a certain time, excessive dose defeats the object, 25,878.
Small doses exhilarate and increase power for work, 26,001.
Used after hard work with great benefit, 26,413.
Runners capable of great exertion through opium-eating, 26,696.
Moderate use has a sustaining power; enables consumers to undergo great exertion without fatigue, 26,711.
Seems to give strength and perseverance, 27,031.
Use in moderation a stimulant and tonic, 27,135.
Paralyses the nerves, so workmen do not feel fatigue, 27,282.
Stupidity induced by opium renders men insensible of fatigue; does not and cannot strengthen them, 27,837.
Used when going on long journeys, 28,115.
Best and least harmful of habitual stimulants, ii. 318.
Effect of opium on the cerebral functions, ii. 408, 413, 417.
Powers of enhancing endurance noticed among Bengal boatmen, ii. 409.
Effects of opium, alcohol, and ganja compared, *ib.* 414.
Labourers work harder under influence of opium, iv. 375

STRAITS SETTLEMENTS:

Chinese opium consumers receive the highest character for sobriety, &c., 1145.
Chinese 60 or 80 per cent. of the population, 1448–51; 30 or 40 per cent. opium-smokers, 1452–56; some smoke to excess, but generality moderate, 1460.
Morphia popular in Singapore, 2258.
Centres of Chinese population, 5255–57.
Particulars of the opium trade, 5346.
Effects of opium on Chinese population, 5366, 5380–88.
Re-exports of Bengal opium to China, 5425–29.
Indian opium imported, 1855–56 to 1893–94, ii. 335, 390.
Opium-smuggling into Burma, ii. 501.
Consumption almost exclusively by Chinese, v. 146, 154–82 (par. 1).
Retail price of chandu, v. 146 (par. 1).
Exports and imports of opium, v. 146; of chandu, 147.
Prevalence of habit among the different races, v. 147, 154–82 (par. 2).
Addiction to opium by particular classes, v. 150, 154–83 (par. 7).
Prohibition would be ineffectual, v. 151; would not reform the smoking community, *ib.*; would cause serious trouble, *ib.*, 154; would probably lead to increased consumption of alcohol, v. 151.
People would object to increased burden, v. 152 (par. 12); opium and spirit monopoly contribute one half of revenue, *ib.*; no satisfactory substitute can be found, *ib.*

STRAITS SETTLEMENTS—*continued.*

Absolutely no feeling against England for allowing export of opium, v. 153 (par. 16).
Particulars of opium-smoking prisoners, v. 175.

—— NATIVE STATES:

Consumption of opium, v. 155, 163, 165, 168, 173, 181 (par. 18).

SUBSTITUTES FOR POPPY:

No specially valuable crop to substitute for poppy, 2054, 2075, 11,392, 22,990.
Market garden crops might be substituted, 5252, 5536; pay better near towns, 10,796, 10,806, 10,843, 19,917.
No substitute in second-class land, 5252–3.
Comparison of various substitutes, 5515, 5536–38, 5553–56, 12,167–86, 12,346, 12,357–59, 12,754–61, 12,796–98, 12,872–74, 16,019–23, 16,523, 16,530, 20,551, 20,604, 20,695, 20,700–7, 20,714, 21,869.
Suggested substitutes for poppy, 10,796, 10,809–10, 10,827–29, 10,843, 21,773, 22,149–54, 27,055.
Difficulty in substituting other crops for poppy, 20,604.
Expenses per acre, gross value, and net profit to cultivator of poppy and other crops, 21,750, 21,751, iv. 402.
Statement showing difference of profit per acre under poppy, wheat, barley, &c., iv. 400, 401.
Statement showing difference of profit per acre under poppy, wheat, barley, &c., iv. 401.
Comparative cost of poppy and other crops, v. 72–76.
Barley as a substitute, 12,173–75, 12,740, 12,754, 20,635, 20,680, 20,695, 20,711,
Cereals as a substitute, 2579, 5265–67.
Cotton as a substitute, 5264, 5272, 5321, 20,635, 20,680, 20,695, 20,711, 20,714.
Very precarious crop; not regarded as a substitute for poppy, 22,150.
Oats as a substitute, 11,132–39.
Potatoes as a substitute, 10,796, 10,843, 11,165–68, 11,196, 11,305–7, 11,352, 11,644–51, 11,711, 11,712, 12,017, 12,111–17, 12,173–75, 12,183–86, 12,754, 13,254, 13,255.
Sugar cane pays better than opium, 2836; as substitute for poppy, 5252, 5266, 8629, 9301–2, 10,796, 10,843, 11,152, 11,165–68, 11,196, 11,352, 11,644–51, 11,980, 12,017, 12,173–76, 12,180–82, 12,740, 12,754, 13,254, 13,255, 15,078, 15,114–20, 15,247, 15,262, 20,551, 20,604, 20,635, 20,680, 20,695, 20,711, 20,714, 23,309.
Requires irrigation for 12 months, 5515, 5553–58, 20,563.
More profitable than poppy in suitable districts, 6282–87.
Pays well but three times as long in the land as poppy, 19,459, 19,536.
Cultivated to a small extent in Meywar; occupies the land a year and a-half, 20,469.
Requires to be watered all through hot weather, 22,152, 22,936..
Requires larger capital and longer time than poppy, 22,342.
Very exhausting crop; wells generally insufficient, 27,056.
Involves a great deal of expense, 28,055.
Tobacco as a substitute, 2838, 5252, 5259, 5261–63, 5559–64, 10,796, 10,843, 11,165–68, 12,111–17, 12,346, 12,754–57.
Not likely to supplant poppy-growing, 19,473.
Not a substitute for poppy unless people have sufficient skill to grow it, 22,153.
Wheat as a substitute, 11,017, 11,019–26, 11,352, 11,377, 11,643, 11,644, 11,650, 12,173–75, 12,740, 12,754, 13,253, 15,078, 15,114, 15,348, 20,635, 20,680, 20,695, 20,711, 20,714.
Wheat could be substituted with great advantage, 11,017, 11,352, 11,377, 11,643, 11,644, 11,650.
Not nearly so valuable as poppy in many respects, 14,363, 14,389, 14,390–94.
Would be the general crop in Central India if poppy prohibited, 22,149, 22,192.
Next best crop to poppy in Indore, 22,266, 22,344.
Wheat could be substituted in Malwa, but would not pay so well, 22,303.
Irrigated wheat would probably take place of poppy, 22,622.

SUBSTITUTES FOR POPPY—*continued.*

Would not pay cost of irrigation in Bhopal, 22,936.
Pays better than opium on poor land, 23,000.

*See* CULTIVATION.

SUGAR CANE:

*See* SUBSTITUTES FOR POPPY.

SUICIDE:

Nearly one-half of suicides due to opium, 274.
Chinese prefer opium to any other form, 562.
Opium commonly used in Hong Kong, 1389.
Opium largely used as a means of suicide, 1669–73.
Encouraged by sale of opium, 2605, 2679–87.
Facilities for obtaining opium are excessive, 3635–40, 3664, 3894–96, 4293, 4368–74.
Restriction should be placed on sales, 3983, 4009–15, 4718.
Does not depend on facilities for procuring opium, 5952.
Cases appear to be increasing, 5990, 6014, 6020.
Opium is only the instrument, not the cause, 8763.
List of suicides in Calcutta, 1883–92, 8985.
Opium generally used, being readily available, 11,695, 19,080, 19,086, 19,733, 26,540, 26,586.
Ten per cent. due to opium, 13,063.
Number would be greatly reduced if opium sold only as a poison, 13,115.
Favourite poison, 16,094.
Opium more easily obtained than other poisons, 18,027.
Sometimes used for suicidal purposes by females, 18,795.
Women commit suicide by taking opium by reason of facility in purchasing it, 18,927.
Cases sometimes occur through opium, 19,316.
Opium a common mode of committing suicide, 20,130.
Opium sometimes taken by suicides, 20,178.
Desire to commit suicide because addicted to opium-eating unknown, 20,278.
More frequent in females than males, 24,125.
Sudden deprivation of opium has led to attempted suicide, 25,295.
Cases of opium-poisoning generally suicidal, 25,959.
Opium not known to cause suicide, 26,044.
Four hundred and sixty-three suicides from opium in Bombay during last 22 years, 26,369.
Eighty per cent. committed with assistance of opium, 26,896.
Influence of opium very often leads to suicide, 27,334.
Opium not a common method, 27,493.
Suicide by opium common in China, especially among women, 27,753.
Method of administration, 27,789–91.
Opium mixed with oil usual means of suicide among women, 27,861.
Can be carried out irrespective of opium, ii. 317.
Comparative table of use of opium, &c., iv. 453.
Statement showing suicides by opium in Madras City, 1889–93, v. 132: in Madras Presidency, 1888–92, *ib.*; in Bombay Presidency, 1888–93, v. 133; in Bengal, 1888–92, *ib.*; in N.W. Provinces and Oudh, *ib.*; in the Punjab, v. 134; in Burma, 1889–93, *ib.*; in the Central Provinces, *ib.*; in Assam, 1889–92, v. 136.

SURGERY:

Habit a disadvantage in operation cases, 5833, 5874–77.
Habit no bar to surgical operations, 15,984.
Apart from disease for which taken, opium does not appear to affect operations, 20,283.
Habit has no influence on recovery from operation, 21,443, 21,447.
Prevents wounded getting tetanus; helps to heal sutures, 23,595.
Used in cases of tetanus with good effects, 23,684.
Opium-consumers recover from ophthalmic operations in same numbers as non-consumers, 24,700.
Opium does not appear to retard recovery from operations, 25,370.
Useful after operations, especially in cases of women after severe labour, 25,798, 25,799.
Habit does not interfere with recovery after operations, ii. 414.

SUTTEE:

*See* PRECEDENTS.

T.

TAMILS:

Consumption of opium very small, 26,525.
Alcohol used more than opium, 26,528.

TAXATION:

People would resent taxation to replace opium revenue, 900, 5509, 16,902, 18,637, 19,394, 24,576.
Imposition of taxation to make good loss from prohibition of opium would cause serious discontent, 2058, 2708, 5953, 5954, 6119, 16,075, 22,666, 24,970.
Indian opium fully taxed, 2070.
People extremely sensitive about any increase, 2277.
Suggested tax on tobacco, *ib.*, 2383–87, 2602, 3059, 5662; would be highly resented, 2755, 8765, 18,819.
Impossible to levy duty equal to that raised by Bengal monopoly, 2930.
Taxation to make up loss of opium revenue inequitable, 3193.
People unwilling to bear whole or part of cost of prohibitive measures, 3270, 3893, 10,392, 10,947, 10,982, 13,930, 14,418, 16,505, 16,529, 17,234, 17,257, 17,373, 18,432, 18,872, 18,879–87, 18,896, 18,906, 18,916, 19,081, 19,088, 22,834, 22,853, 22,869, 22,897, 22,911, 23,627, 23,658, 23,690, 23,727, 23,738, 23,752, 23,778, 23,825, 23,865, 23,877, 23,910, 23,928, 23,941, 23,950, 23,982, 24,217, 24,278, 24,363, 24,375, 24,390, 24,427, 24,453, 24,470, 24,498, 24,519, 24,553, 24,628, 25,102, 25,112, 25,137, 25,233, 25,264, 25,513, 25,569, 26,257, 26,409, 26,653, 26,759, 26,771, 26,776, 27,473, 27,579, 27,699, 27,733, 28,114, 28,124, iv. 495, 497.
General objection to bear any increased taxation, 3978, 5988, 11,898–99, 16,030–35, v. 126.
Heavier duty would be keenly felt by poorer classes, 4447.
Any addition for meeting cost of prohibition would be a great injustice, 4577, 4594–96.
Income-tax would be even more obnoxious than tax on tobacco, 5663.
Bengal unwilling to pay the cost, 6422.
Mahomedan community not prepared to bear any part of cost, 8407.
People unable to bear whole or part of cost of prohibitive measures, 8407, 8491, 12,961, 15,391, 15,452, 22,761, 22,782, 24,204, 24,236, 24,258, 24,301, 25,196, 25,213, 25,218, 26,899, 28,134.
Government would not long survive any attempt at increased direct taxation, 10,786, 10,787.
Fresh taxation would be a greater evil than opium habit, 12,940.
Impossible for people to pay any increase, 13,678.
Any imposition to meet cost of prohibition would be most unpopular, 13,941.
Tax should be considerably raised, 15,156, 15,174–82, 15,185–88.
Further taxation would be particularly impolitic, 15,283.
Idea that Indian people would pay cost of prohibition quite chimerical, 15,701.
Tax to meet loss would be a double hardship, 17,224,
Punjab is discontented with present taxation, 17,655.
Any new tax would be particularly odious, 18,151.
People of Sind unwilling to bear extra taxation, 18,577.
People not at all prepared to pay fresh taxation, 18,819.
New taxation would be felt very much, 19,642.
People neither willing nor able to bear cost of prohibition, 19,749, 19,757, 19,777, 19,780, 19,820, 19,837, 19,853, 19,883, 19,885, 19,890.
Country not prepared to bear further taxation, 20,069, 20,117.
Any attempt to make men pay for loss of revenue would be oppression, 20,267.
Fresh taxation would cause fresh dissatisfaction, 22,666, 23,999.
Grave political error to threaten people with cost, 22,717.
Unjust to charge cost of prohibitive measures to India, 24,543.
Natives would regard with anger and dismay any attempt to levy taxation; opium tax not unpopular, 24,811.
Direct taxation to replace opium revenue impossible, 25,062.
Increased taxation highly undesirable and inexpedient, 25,552.

TAXATION—*continued.*

Whole country would resent being saddled with any part of the cost, 27,035.
Increase, to make up loss by abolition of a universal custom, would be an unbearable affliction, 27,398.
People would very strongly object to increased taxation, 28,071.
Loss through prohibition of madak should be made up by increased duty on opium, 28,124, 28,131.
People not prepared to submit to fresh taxation, iv. 374, 375.

*See also* FINANCE.

TA-YEN:

Smokable extract used in China, 1661–65.
Swallowed by suicides; much more fatal that way than through the pipe, 1670.
Very little morphia decomposed in the pipe, 1671.

TIJARA:

Cold infusion of poppy heads, 21,073, 21,082.

TOBACCO:

Tobacco-smoking in China, 771–74.
Comparison of anti-tobacco and anti-opium movements, 1810–20.

*See also* SUBSTITUTES FOR POPPY.

TOLERANCE:

Chinese bear opium better than Burmese, 263, 295.
No difference in races as to effects of opium, 730, 4395, 4402.
Effect on different races may differ in degree, but not in essence, 855.
Great difference between the various Indian races, 897.
Probable difference between Chinese and Indians, 1156, 1157.
Europeans require larger doses than natives, 2199–203.
Much more hurtful to Chinamen than Indians, 2245.
Impossible to discriminate between races, 2323.
A race question in India, 3420, 3492–508.
Indian complaints seem to need opium, 4159.
Habit almost confined to dwellers on alluvial soils, 4994.
Opium has not affected the Sikh race, 6844.
No particular difference noticed in effects on different races, 7500.
Chinamen not affected physically or morally, 7541.
Burmans strongly affected morally, 7542, 7580.
Kachins not so much affected as people who live in hot climate, 7601.
Some men can use much more than others, 7791. 12,616, 12,626–30.
Chinamen, Sikhs and Punjabi-Mahomedans use opium habitually without detriment to health, 7916.
Acts entirely differently on different races, 7942.
People from cold climates seem to take opium almost universally, 7943–45.
Climate of India not so congenial to alcohol as to opium, 8852.
Different effect on different people, 8907, 11,813, 11,843, 13,842, 15,990, 15,991, 19,994, 21,302, 21,448.
Effect on natives and English people quite different, 10,129, 14,097, 14,098.
Stimulants always objectionable in tropical countries, 11,874–77.
Some people bear incredibly big doses with impunity, 11,889.
Not injurious to the native constitution, 13,843.
Action of opium on natives not nearly so great as on Europeans, 14,099, 27,830.
Opium not suitable to Europeans, 14,320–28.
Effect of smoking on the Hindustani and Chinaman probably somewhat different, 14,352.
Best possible stimulant for natives of the East, 15,907, 15,963, 26,640.
Great difference in individuals, 15,951–53, 17,633.
Immense difference; a great deal depends on the way a man lives, 16,593, 16,594.
Seems to agree with Eastern nations, 16,885.
Depends on constitution and food, 16,902.
Effects depend upon race or individual idiosyncracies, 17,159.
Distinct difference between opium-smoking by Chinamen and Indians, 18,537.
Opium better stimulant for natives than Europeans, 19,267–71.

TOLERANCE—*continued.*

Much greater among natives than Europeans, 19,363–76, 25,896.
Entirely a matter of idiosyncracy, 19,437.
Undoubted individual difference, 19,490.
Different races or constitutions differently affected, 19,527.
Natives tolerate opium better than Europeans, for climatic reasons, 21,885.
Great variation in individual susceptibility to opium 22,031.
Opium suits phlegmatic Orentials, as tobacco does energetic Europeans, 24,702.
Increases with increasing doses, 24,740.
European babies become comatose under a dose that would not affect a native baby, 24,745.
Difference of tolerance between Europeans and natives of same age and weight, 24,755, 24,767, 24,768.
Idea of difference arises from imperfect knowledge of opium, 24,868.
Depends upon climatic circumstances, surroundings, food, &c., 25,006.
Opium peculiarly adapted to climate and races in the East, 25,300.
Better tolerated, and perhaps required, in a warm country like India, 25,669.
Children bear opium worse than adults, *ib.*
Evil effects vary with the constitution, 26,286.
Some individuals tolerate much larger doses than others, 26,367, 26,375.
Indians not better able to resist opium than Chinese, 28,168.
Remarkable difference of susceptibility to opium, ii. 417.
Opium specially deleterious to Burmese, ii. 537.
Smoking has decidedly worse effect on Malays than on Chinese, v. 148.

*See also under the various Races.*

TONK:

Details of poppy cultivation and trade, 21,228–66.
Operations of agricultural banks, 21,270–87.
Profits of the opium trade, 21,291.
Statistics of poppy cultivation and opium consumption, iv. 393.
Estimated loss to the State, &c., if cultivation prohibited, iv. 394.

TONQUIN:

Consumption of opium, 5372.

TOTAL ABSTINENCE:

Abstinence from alcohol not recommended under all circumstances. 4384.
All intoxicating drugs are unnecessary, 6343, 6376.
Indian Order of Total Abstainers, 9453, 9503, 9504.
Views of the Prohibition League, 11,036–40, 11,071–80.
European abstainers influence natives against opium, 12,526, 12,528.
Abstainers use opium, as it is not an intoxicant except in large doses, 12,715–25.
Communications received by Total Abstinence Societies in favour of prohibition, 13,250, 13,251.
Progress of the movement in Benares, 13,272–75.
One of the objects of the Temperance Association is to stop sale of opium, 14,598–601.
Temperance societies have done a great deal of good, 15,591.
Punjab Purity Association, 18,236–42.
Temperance societies tend to check opium habit, 18,627.
Teetotallers do not like use of opium, 18,904.
Temperance societies in Baroda, 22,385–411.
Native churches try to enforce total abstinence, 27,543.

TRADE (IN OPIUM):

Should be open to private enterprise, 1165, 1180.
If opened to the public would cause enormous increase in production, 5514.
Effect of Chinese opium trade on the general balance of trade, 5757–61, 5771–73, 5779–84.
Profitable to all concerned in it, 8502.
Profits of the opium trade, 21,790.
Regarded as a very uncertain article of trade, 23,457.

TRADE—*continued.*

Prohibition of China trade would directly affect revenue, and seriously affect the balance of trade, 26,702, 26,706.
Opium trade extremely important, 26,841.
Effect of cessation of opium export on exchange, 26,855–60, 26,863.
Stoppage of Chinese trade would not lead to increased exports of other Indian produce, 26,867–89.
Effect of Indian opium trade with China on Indian rate of exchange, i. 136.

TRANSIT:

Malwa transit duty system, 2445.
Licenses not always insisted on, 16,023, 16,036–38.
Duty on Malwa opium, i. 135.

V.

VENDORS, LICENSED.

Licensing system leads to increased consumption; vendors advertise and push the trade, 3, 122–32.
Purchase smuggled opium, 2431.
Principal object to increase sales, 2691–96.

VENDORS, LICENSED—*continued.*

Sufficient care not taken in selecting proper persons, 3984.
Assist Government in tracing illicit chandu shops, 4939, 4941, 13,691.
Open sale would lead to increased use, 6426.
Sale should be under police regulations, 6435, 6441–47.
License-holders push the sale of opium, 10,693–97, 10,711–17.
Some help to the Government as detective officers, 10,788,
Licenses should be restricted to trustworthy persons, 12,819, 12,820, 19,019.
Have a direct interest in increasing sale, 14,822–24, 14,828.
Endeavour to prevent smuggling, 14,867, 14,868.
Have to recoup themselves by sales for high price of licenses, 18,155–57.
Great check on smuggling—by others, 18,180, 18,181.
Price at discretion of the vendor, 19,574, 19,588.
Valuable aid in preventing smuggling, 19,602.
Smuggle large quantities under screen of licenses, 22,745.
Help collectors to detect smuggling, 27,500.
Use utmost endeavour to extend consumption, 27,839.
Number of shops and receipts from license fees, 1883–84 to 1892–93, ii. 348–54.

*See also* LICENSING, SALE.

VENDORS, OFFICIAL.

Difficult to get reliable salesmen, 2374–79.
Opium should be sold by registered druggists as a poison, 2487–94, 2508–15, 2537.
Should be sold only in hospitals and medical stores, on medical certificate, 2786–90.
Existing dispensaries quite insufficent for proper distribution, 3196, 14,191, 20,173.
System could not be worked, 3267.
Scheme impossible through want of sufficient number of skilled medical men, 3421.
Number of druggists and medical men quite insufficient for distribution of opium, 3524–27.
Sale should be entrusted to qualified persons with no interest in sale of drug, 3769.
Difficult to get suitable persons for sale as medicine only, 4601–2.
Opium cannot be provided from dispensaries, 4695.
Number of medical practitioners in outlying districts insufficient to prevent sale for vicious purposes, 4769–74, 4997.
Difficult to find trustworthy people in the villages, 4789–94
Where no medical men available, could be sold through post offices, 5849.
Should be sold only at dispensaries, on medical prescription, 5916–18,
Village panchayets should be entrusted with sale for medical purposes, 8625, 9270–78.
Distribution should be made through dispensaries and hospitals, and shops in each village or group of villages, 8625, 8648, 24,343–47.
Impossible to put opium within reach of people in the interior, 10,920–25.
Opium should be sold in licensed chemists' shops only, 11,449.
Should be sold by registered practitioners, 12,667, 12,668.
Opium should be sold by licensed chemists, 13,115, 13,127–39, 13,147–55, 13,217–19.
Dispensaries insufficient; might be distributed through the Tahsildars, 13,919–31.
Sales should be confined to authorised medical shops, 14,010.
Native practitioners could not be safely trusted, 14,071, 14,072, 14,077–79, ii. 461.
Number of practitioners according to European method insufficient, 14,073.
No security that native druggists would not sell opium for purposes other than medical, 14,085.
Unlicensed practitioners should not be entrusted with sale, 14,[illegible]–41.
Qualified body of men does not exist, 14,739, 14,859–62.
No agency available for sale as medicine, 14,912, 14,943–49.
Should be sold through the Medical Department only, 15,199–207.
Sale should be restricted to trustworthy people, 15,627, 15,659–64.

VENDORS, OFFICIAL—*continued.*

Sale should be entrusted to European and native chemists of good character, 16,573, 18,963, 18,989–91.
Sale should be restricted to educated chemists, native or English, 16,670–76; and sales registered, 1667.
Agency for distribution insufficient, 17,231.
Sale should be carried out by licensed local practitioners or druggists of undoubted respectability, 17,914–23, 17,957–69.
Could be sold like other medicines, 18,066.
Would have to be paid high salaries to prevent smuggling, 18,158–60, 18,182, 18,183.
Should be sold as a medicine by recognised practitioners, 18,927; including native doctors, assistant surgeons, and recognised native Hakims, 18,934–36.
Existing dispensaries in Agra District would be insufficient, 19,267.
No medical agency exists in the country, 19,531.
Village medicine-men would be turned into opium-vendors, *ib.*
Government officials would probably abuse monopoly of sale, 19,580–84.
Sale should be entrusted to druggists and medicine-sellers, 19,733.
Prescription should be confined to official doctors, and recognised Hakims and Vaids, 20,150–60.
Impossible to give medical sanction for use in every village, 20,265.
Paucity of reliable druggists would lead to practical prohibition in certain districts, 21,398–401.
No chemists available for supply for medical use, 21,814.
Prohibition would lead to corruption in subordinate medical service, 22,284.
Distribution in form of tinctures would be disliked by the people, who regard all liquid medicines as spirit, 22,385, 22,458.
Impossible to decide who should be regarded as medical practitioners, 22,718–21.
No trustworthy agency in existence, 26,251, 26,252.
Distribution should be entrusted to medical men, hospital assistants, &c., 27,845.
Impossible to limit sale to qualified practitioners' prescriptions, i. 143.
Idea of entrusting prescription to native Vaids, Hakims, and Pansáris ridiculous, *ib.*
Druggists not found in sufficient numbers, ii. 317.

*See also* SALE.

WITNESSES:

British Indian Association; nomination of witnesses, 8793–800.
Position of Indian Government in respect of the production of evidence before the Commission, *ib.*, ii. 259, 274, 275.
Dissent from President's view, ii. 259.
European officials not so competent to form a correct opinion as natives, 9966, 10,012.
Official inquiry for abstract of intended evidence, 10,293–97.
"Shadowing" by the police, 11,424–27, iii. 25.

WITNESSES—*continued.*

Cultivators unable to come before the Commission, 11,449, 11,451, 11,535–41, 11,601.
Alleged tampering with medical witnesses in Allahabad, 13,166–85.
Preparation of abstracts of evidence of native witnesses, 15,702.
Translator of statement unknown to a witness, 16,536.
Medical officers have better opportunities for studying native habits than missionaries, 16,887–92.
Missionaries understand the people better than officials, 16,902.
Witnesses from Native States in Rajputana who were not examined, 21,746, 21,747; from Gwalior and Indore, 22,379; from Native States in Central India, 23,306.
Commission naturally collects evidence from residents, 23,374.
Missionaries have a better opportunity of getting at popular opinion than officials, 23,486, 23,511.
Great fear of official pressure among native witnesses, 26,585.
Evidence of missionaries gives true idea of popular feeling, 26,518, 26,529.
Attempted publication of a scurrilous letter reflecting on a witness, 27,084.
Four anti-opium witnesses from Jeypore erroneously alleged to have been put in jail by the authorities, 27,379.
Statements by persons not offering themselves as witnesses for cross-examination rejected by the Commission, 27,381–84.
Limitation placed on reading extracts from writings of other persons, 27,513.
Missionaries have special facilities for learning the habits of the people, 27,824.
Statement by Mr. Wilson respecting police interference, iii. 10.
Statement respecting selection of medical witnesses in North-west Provinces, iii. 96.
Alleged tampering with official and other witnesses by Bombay Government, iv. 373, 374.
Witnesses tendered for examination from Native States in Central India, but not examined, iv. 417–24; from Madras, iv. 448–54; from Hyderabad, iv. 505–10; from Central Provinces, iv. 523, 524.

*See also* EVIDENCE.

WOMEN:

Smoking induces sterility, 565.
Chinese women smoke opium, but not so frequently as men, 1648, 1979, v. 212–341 (par. 2).
Practice greatly increasing among factory women, 2757.
Mahomedan women use opium as an aphrodisiac, 2593.
Do not like opium, 3928.
Known to take opium after 35 or 40, 3963.
Very few women of the upper classes take opium, 4127–30, 4133–39.
Very few among the cultivating classes take opium, 4562.
Reports concerning horrors of opium-consumption in Zenanas exaggerated, 5470, 5489.
Twenty per cent. of Kachin women smoke, 7639; one-half, 7903.
Women smokers in opium dens, 7747.
A number of Mahomedan ladies use opium as a stimulant, 8455, 13,978.
Mahomedan women take opium, especially in Oudh, 8519
Habit prevails among women of Assam, 8594.
Use opium quite as much as men among Assamese coolies, 10,038.
Wives of cultivators exposed to temptation through storing of opium, 11,466–73.
Horrors of the opium trade in the zenanas, 11,428.
Women of ill-fame smoke opium, 11,677.
Habit spreading as a remedy for female complaints, 11,695, 11,703.
Mahomedan ladies sometimes take opium, but never smoke, 11,807.
Many women use opium, 12,564.
Thirty per cent. of prostitutes consume opium, 12,652; 70 per cent. in Straits Settlements, v. 147 (par. 2).
Habitual use renders females barren, 12,659.
When administered during pregnancy kills or hurts the child, *ib.*

WOMEN—*continued.*
Four per cent. consume opium in Mirzapur, 13,008.
Very small number opium-eaters, 15,675–84.
Proportion of consumers almost *nil*, 16,057.
Opium-eating common after middle-age, especially among Kabulis, 16,088.
Effects on women, 16,090.
About five per cent. of the females take it, 16,464.
Use opium less frequently than men, 17,101, 19,809, 20,168.
Rarely use opium, 17,151.
Opium-eating prevalent among higher-class women of Lucknow, 17,747, 17,780–83.
One-half the women of all classes eat a little opium, 17,747–60, 17,792–94.
Ten per cent. of Assamese women eat opium, and 20 per cent. smoke it, 18,348, 18,352.
Seventy-five per cent. of Assamese tea-garden coolie women smoke opium, 18,350.
Many native females take opium regularly, 18,769.
Take opium less than men, usually for disease, or through grief, 20,278.
Mostly use opium as medicine or a tonic in advanced age, 20,421.
Some women in Rajputana use opium habitually, 20,865.
Take opium in illness, 20,990.
Two per cent. of Rajput women take opium, 21,073, 21,082, 21,116.
Smaller proportion take opium than men; always for alleviating pain, 21,506.
Per-centage of consumers among zenana ladies said to be between 10 and 20, 21,511.
Forty per cent. of Rajput women use opium, 21,577.
Rajput women addicted to alcohol, 21,655.
Only widows and old women use opium among the Rajputs, 21,760.
Very rarely take it to excess, 21,762.
Ten per cent. of Malwa women take opium, 21,912.
Individuals found among all classes who take opium, 22,577.
Prostitutes, especially Mahomedan, take opium as a habit, *ib.*
Many women treated in hospital for injuries through opium, 23,390.
Use opium as a medicine, also as a stimulant, 23,874.
Very few use opium habitually, 24,118.
Should not be permitted to smoke madak, 25,293.
Generally contract habit between 25 and 30, or earlier when contracted on parturition, 25,396.

WOMEN—*continued.*
Generally commence habit about 30 for some ailment, 25,858.
Usually contract habit for disease, 26,286.
Considered a shame for a woman to smoke opium, 27,826.
Many resort to opium through pain of womb diseases, 27,828.
Much less used than by men; usually for disease, iv. 379.
Opium-eating in zenanas in Hyderabad, iv. 507, 508.

STHANIK NIBANDH - A State law in Baroda.
SWAMI NARAYAN - A sect of Hindus, chiefly found in Gujarat.

TAEL - - A Chinese silver weight = 1⅓ oz.
TAHSIL - - A subdivision of a district.
TAHSILDAR - - The officer in charge of a Tahsil.
TAKIA - - The shrine of a Muhammedan saint or ascetic.
TALUK - - A subdivision of a district, or an estate comprising a number of villages.
TALUKDAR - - The owner of a Taluk, or large estate.
TALUKDARI - - The tenure of a Talukdars' estate.
TALOD - - A local cess on opium in a State of Rajputana.
TAMIL - - The race and language of the population of the extreme south of India.
TARAI, or TERAI - A belt of marshy forest adjoining the Himalaya.
TARA HURA - Pills of opium in Rajputana.
TARI, or TADI—TODDY - - } The juice of the palm tree.

| | |
|---|---|
| Tazimi Sirdar | A noble who has what corresponds to the "private entrée" at the Court of his chief. |
| Tejara | A cold infusion of poppy heads. |
| Terai | *See* Tarai. |
| Thakur | A Rajput Chieftain. |
| Thana | A police station. |
| Thandar | The officer in charge of a thana or station. |
| Thali | Brass platter. |
| Thathameda | A poll tax in Upper Burma. |
| Thekana | Tributary chieftains under the Jeypore State. |
| Thekadar, or Ticadar | Farmer or contractor. |
| Thugyi | A revenue collector in Burma. |
| Ticadar | *See* Thekadar. |
| Tical | The Burmese term for "tola," or 180 grains weight. |
| Tika Sahib | Son and heir to a chief. |
| Tilak | The caste mark affixed to the forehead by Hindus. |
| Tilbheda | Sanskrit for poppy. |
| Tipdar | Middlemen in Central India. |
| Tola | A standard weight of 180 grains. |
| Tonga | A small carriage on two wheels. |
| Tulai | Weighment (of opium)=Wazan Kashi. |
| Tullawati | Ditto (ditto). |
| Tulsi | The Basil plant. |
| Triyak | A universal remedy in Hindu medicine. |
| Urdu | The Court or Camp language of the Delhi Emperors, consisting of Hindi largely mixed with Persian. |
| "Up Country" | Used of the interior or north of India by residents of the coast tracts. |
| Udak | A grant of rent-free land in charity. |
| Vaid, or Baid | A medical practitioner on the Ayurvedic or Hindu system. |
| Vaidya | |
| Vakil | A representative, but usually taken to mean a pleader. |
| Val, or Wal | A small seed used as a weight in Bombay. |
| Vanmamagis | A class of ministrants to a shrine in Gujarat. (*Apparently a misprint*). |
| Vasua | A local cess in Rajputana. |
| Vasava | Village watchmen in Gujarat. |
| Vedantism | A school of Hindu metaphysics. |
| Viga | =Bigha. |
| Vilayati Daru | European spirits. |
| Vishamajwar | Remittent fever. |
| Viss | A weight in Burma=3·68 lbs. |
| Vazir | The minister to a chief. |
| Vrat | Hindu fasts. |
| Wasika | State funds in Oudh, set apart for pensions assigned by the late Nawab. |
| Wazan Kashi | A tax on opium by weight in Central India. |
| Wun | A chief minister of the late court of Ava. |
| Yad Dasht | A memorandum. |
| Yek Fasli | A crop that is sown and reaped in the same year. Sometimes land cropped only once a year. |
| Yunani | Ionian. The Arabic system of medicine. |
| Zabti, or Zapti | Cash rates used for special crops in territories where ordinary crops pay in kind. |
| Zaildar | Headman over a circle of villages. |
| Zakat | Customs duty. |
| Zarda | A coarse sort of tobacco. |
| Zemindar | Landowner. |
| Zenana | The women's apartments in a house. |
| Zilla | A district. In Behar, the subdivision under a subordinate official of the Opium Department. |
| Zilladar | The official in charge of an opium zilla. |
| Zira | Cumin seed. |
| Ziyadah | Excess. |

# APPENDIX H.*

Osgathorpe Hills, Sheffield,
December 5th, 1894.

DEAR LORD BRASSEY,

I am sorry that it should be needful for me to complain in reference to certain matters connected with the Commission.

I. I am informed by Mr. Baines that no minutes of the proceedings of the Commission have been kept, or, at any rate, are now available. This, I understand, is entirely contrary to the usual practice.

II. It appears to me that our Indian colleagues have not been treated with the consideration to which they were entitled in reference to their coming to this country for the purpose of taking part in our deliberations on the Report. As regards the Maharaja of Darbhanga, it was, I am aware, generally understood that he was not willing to undertake the journey, but that general understanding was no reason why he should not have been formally and courteously invited. The case of Mr. Haridas is different. He appeared to be desirous of coming; and had he been formally and courteously invited at the proper time, before he had resumed his duties as Dewan of Junagarh, there is every reason to believe that he would have been glad to accept the invitation; in fact, he distinctly stated that your Lordship told him you would inform him in June as to whether his presence would be required in England, and had he been so then informed he would doubtless have been able to avoid taking up his new appointment in August last.

III. It appears that when at last, in consequence of my representations, Mr. Haridas was invited to come to this country, the communication was not sent direct to him, but through the India Office, and then successively through the Government of India and the Government of Bombay. This was, I submit, a departure from the usual practice of Royal Commissions, and distinctly derogatory to the position of such a Commission and of a Royal Commissioner. Mr. Haridas has thus been treated as though he were merely an official under the Indian Government, to be communicated with through the usual system of official routine.

IV. It appears further that our Indian colleagues have not been promptly furnished with the sections of the Draft Report. Four parts were received by me up to the 2nd of August, and might have been in their hands in the third week of the month, whereas Mr. Haridas, when he wrote on the 9th October, had not received any part.

V. The Secretary of the Commission sent for my perusal a letter from Mr. Fanshawe addressed to the Chairman, proposing that the correspondence between the Indian Government, the Commission, and myself in reference to the action of the authorities should be published in the Appendix. I returned to the Secretary the letter of Mr. Fanshawe, saying that I did not object to such publication, but that the last letter of the series, namely, that dated the 3rd February 1894, should have a note appended to it indicating that it had not been communicated to me for three months after the date it bore. My request has not been complied with, and our Secretary informs me that it was ignored by him on his own responsibility. I submit that in so acting he exceeded the limits of his authority.

I have to request that you will be so good as to place this letter before the Commission at a suitable but early part of the meeting on the 7th instant.

I remain,
Dear Lord Brassey,
Yours faithfully,

The Right Honourable Lord Brassey, K.C.B. HENRY J. WILSON.

* This correspondence is added to the proceedings in compliance with the Chairman's undertaking expressed in the last paragraph of his letter of the 10th December, *see* next page.

Normanhurst Court, Battle,
10th December 1894.

My dear Wilson,

I much regret that your letter of December 5th, but which bears on the envelope the London postmark of December 7th, did not reach me in time for discussion at the last meeting of the Commission. As to the keeping of minutes, there had been no meetings of the Commission since we separated at Bombay. A shorthand writer has been present at every meeting, and his notes have been printed. As regards the invitations to our Indian colleagues, I did not think it desirable to invite them to England until the Report was ready for discussion. You know the delays, and the causes of the delay. As soon as I knew the approximate date when we should be ready for a conference, I informed the India Office. I cannot think that our Indian colleagues would themselves take exception to the mode in which they have been treated. Nothing could have been more cordial than our relations in India from the beginning to the end. I endeavoured to show them in every way the same friendly regard and the same deference to any suggestions or opinions which they advanced, which I have always desired to show to my English colleagues.

I will forward your letter to Mr. Fanshawe and Mr. Baines for any explanations. The correspondence can be published with the minutes of our proceedings.

Yours sincerely,
BRASSEY.

*Forwarded to Mr. Fanshawe* with Mr. Wilson's letter, in compliance with the Chairman's concluding paragraph.

J. A. Baines,
14th December 1894. Secretary.

*Endorsement by Mr. Fanshawe :—*

I have read and now return this correspondence, which I cannot help thinking has been sent to me under some misapprehension. There is nothing, so far as I can see, in Mr. Wilson's letter of the 5th instant on which I am called upon to offer any remarks.

14th December 1894. A. U. Fanshawe.

*Endorsement by the Secretary :—*

As regards the last paragraph of Mr. Wilson's letter, I have to explain that, in a note received from him dated the 24th of July, he wrote—"If you are going to have the "correspondence in question put in type, I think there ought to be an endorsement to "the effect that Mr. Hewett's letter to the Government of India, Camp Ajmere, "3rd February 1894, was not communicated to me until the 1st of May 1894—three "months after date. I shall, of course, have something to say on the whole subject "hereafter."

Mr. Wilson did not inform me that he was kept in ignorance of the fact that such a reply had been sent or of the purport of its contents. The records are the common property of the Commission, accessible to every member. It is neither usual nor necessary, therefore, to formally communicate correspondence to individual members, who have the official copy available for reference. Mr. Wilson was present with the Commission up to the 20th February, and to have added a note to the effect he suggested involves the implication that he was debarred from access to the records and from due knowledge of what action his colleagues had taken in a matter in which he was materially interested. In omitting the endorsement, therefore, I considered it superfluous to refer to the Chairman. The only member of the Commission to whom I informally showed the proposal agreed with my view as to the misapprehension to which such a note would give rise.

J. A. Baines,
Secretary.

*Further endorsement :—*

This correspondence was placed by the Secretary for disposal at the meetings of the 23rd, 24th, and 25th January, but other work blocked the way.

J. A. Baines.

# ERRATA.*

Vol. I., page v, paragraph 6, for "hear" read "bear."
„ „ 40, question "606" should be "506."
„ „ 173, second column, line 3, for "opium" read "opinion."

„ „ 299, „ 26,532, „ for "·3" (of a tola) read "·03."
„ „ 324, „ 27,037, „ 6, before "impolitic" enter "and."

* In the circumstances in which the evidence and proceedings were printed in India numerous typographical errors necessarily occurred. This list contains most of those which have come to light since the publication of the proceedings, in the course of reviewing the evidence for the purpose of drafting the report. There are doubtless many which have escaped notice.

Vol. IV., page 342, question 27,511, line 1, for "Columbo" read "Colombo."
" " 352, " 27,788, " 4, for "Indian" read "India."
" " 365, " 28,057, " 1, for "Fatuer" read "Father."
" " " " 28,061, " 1, for "26,061" read "28,061."
" " 369, " 28,163, " 1, for "21,163" read "28,163."
" " " " 28,164, " 1, for "21,164" read "28,164."
" " 376½ line 3, for "operations" read "opinions."
" " 386–87, the first set of questions should be omitted.
" " 398, 2nd column, line 26, for "consumption read "compensation."
" " 501, par. 15, line 4, for "side" read "sale."
" " 522, In the Table (App. F.), the population of Chanda should be 697,610, and the total for the Province 10,046,546.
" " 296, question 26,437, at end of question add the following:—

*For Fever.*—The Tanna District is considered very malarious because the chief crop is rice. I have made diligent inquiries from the villagers ever since I heard the surprising statement that opium was considered as a preventative and cure for fever. I have never met one Native who ever hinted that it might be good for fever, and when questioned as to whether they ever used opium for fever, the answer invariably was "No." I have made inquiries of the Free Church dispensary at Tanna. During 1893, 12,615 patients (aggregating 36,436 visits) were treated; of these over half were suffering from fever. The doctor uses opium as a drug, *but never for fever.* When asked if during his 14 years of medical practice in this district he ever heard of Native using opium for fever, he said he never had."

Vol. V., page 120, 2nd column, line 41, for "some" read "none."
" " 212, Interrogatories sent to China:—
Question 6, add "If you know any or many cases of great injury give examples."
" 13, omit the words "Do they usually or often take it in the first instance to allay physical pain?"
" 15, the question should be "Is there among the Chinese in the part of China with which you are acquainted any wish that England should not allow opium to be exported from India."

Vol. V., page 372, First column, twelfth line from bottom, after Calcutta, a comma should take the place of the full stop.
" " " Second column, omit the last line of the page.
" " 373, second column, third line from bottom, for "*Cannibas*" read "*Cannabis.*"
" " 375, first column, seventh line, for "*January*" read "*December.*"

# Supplement to the Report of the Royal Commission on Opium.

## NOTE BY THE HON. THE MAHARAJA BAHADUR OF DURBHANGA, K.C.I.E.

I have carefully considered the different sections of the draft Report which have been submitted to me. I note that the Report is, on the whole, drawn up in accordance with the spirit of the resolutions that were passed at the last sitting of the Commission in Bombay, and as such, I am prepared to accord a general support to it.

2. But there are certain points to which I desire more particularly to invite the attention of the British public: and I have therefore, determined to embody them in the form of a separate Note, in which I shall at the same time suggest such alterations and additions in the Report as may, in my opinion, be advisable.

3. It will be my endeavour, in the remarks which I have to offer, to express, as faithfully as it lies in my power to do, the views entertained on the opium question by the majority of the Indian thinking public. I do not, however, conceal from myself that a certain section of the community hold widely different opinions. In the view of some, opium, when used non-medicinally, is little better than a poison, whose only effect is to degrade humanity. On the other hand, there are those who hold that the properties of opium as a drug are highly beneficial, and that its action as a "brightener "of the intellect" is not one of the least of its claims to favourable consideration. The opinions of the former class are not without their value, and are entitled to every respect; but I regret to be unable to admit that they are borne out by the testimony which has been produced on their behalf in the course of the sittings of the Commission.

The export of Indian opium to China.

4. With regard to the export of Indian opium to China, one of the questions we were called upon to discuss, the policy of Her Majesty's Government has been very clearly defined by Sir James Fergusson, when Under-Secretary for Foreign Affairs, in a speech delivered by him in the House of Commons on the 10th April 1891:—"If "the Chinese Government," he said, "thought proper to raise the duty to a prohibi-"tive extent, they ought to shut out the article altogether, for this country would "not spend one pound on powder and shot or lose the life of a single soldier in an "attempt to force opium upon the Chinese." I desire to record my entire sympathy with these sentiments, and I am confident that the Government have no intention of resiling from the attitude then taken up. It cannot be too clearly enunciated that, if the trade in opium between India and China is to be discouraged and suppressed, the initiative must be taken by the Chinese. No one can be better aware than the Chinese Government of the uses and abuses to which opium is put by their subjects. I am at a loss to understand how it can possibly be contended that foreign Governments, such as those of England and India, are more favourably situated for the discussion of such matters, or in what way they are more competent judges than the people and the Government which are most directly interested in the question.

5. It would, in my opinion, be a highly impolitic act on the part of the Government of India to put an end of its own accord to the traffic in opium with China. We possess no guarantee whatever that any such suppression of the trade on our part would in any way diminish the use of the drug in China. Nor have we at present any data to show that such an act of well-meant, but, as it appears to me, wholly mistaken, philanthropy would bring with it the abolition of poppy cultivation in China, or the discouragement of the opium trade between China and countries such as Turkey and Persia.

6. I would also call attention to the financial aspect of the question. Any such suppression of the opium trade in India with China must entail the sacrifice of a large source of revenue without any corresponding benefit to humanity at large or compensation to the Indian taxpayer. The present financial position of the country is not such as to justify any such philanthropic experiments, and I consider it my duty to point out that any action of the nature I have indicated is likely to create grave and serious discontent in this country, where the people have no voice in regulating

the expenditure and where the annual expenditure has enormously increased during the past ten years. The utmost taxable limit has been reached and the fresh and heavy taxation, which would be rendered necessary by the withdrawal of the opium revenue, would be very seriously felt in an impoverished country such as India.

The use of opium in India.

7. A great many medical witnesses were examined. Their evidence as regards the uses and the abuses of opium was conflicting. But I do not wish to enter into the subject. I consider it presumptuous on my part to do so, as the question has been so ably dealt with by Sir William Roberts in his Minute. I would only state here that it has not, in my opinion, been proved that opium is an unmixed evil. I have, however, a suggestion to offer in this connexion. In Burma, certain restrictions have been put on the sale of opium by the Local Government. And I think that in other parts of India also the Local Governments, as well as local bodies like the District Boards, should be empowered to frame rules for the sale of opium according to the circumstances of the different localities. It is impossible to make any suggestions that can apply to the whole of India, and I hesitate therefore to lay down any hard-and-fast rule upon the point. I would, however, urge that opium should be sold in bottles or phials labelled "poison", and the minimum dose which is likely to be fatal should also be legibly printed in the vernacular on these labels. In some parts of the country it is a common practice for mothers to give small doses of opium to young children. I do not wish to express any opinion as to whether this practice of giving opium to young infants is at all necessary for the benefit of the children. I will content myself with pointing out the fact that opium is, unlike alcohol, a deadly poison if taken in excess, and is a dangerous weapon in the hands of ignorant persons. A witness at Lucknow gave evidence to the effect that an infant brother of his was killed by an accidental over-dose of opium administered by his own mother. My suggestion to label phials or bottles in which opium is sold, would be of assistance in reducing the chances of such accidents to a minimum.

8. The habit of opium-smoking is generally looked upon as a degrading habit. Mr. Haridas Veharidas has entered into the subject very fully; and as I find myself in agreement with his views on the subject, I do not propose to discuss the point at any length. Opium, however, is chiefly used as a mild and harmless stimulant. The habit of opium-eating, unlike that of opium-smoking, is not necessarily looked down upon as a degrading habit. It is largely practised in Rajputana on festive occasions as a token of welcome to guests and friends. When two enemies wish to end a long-standing feud, they generally go through the following ceremony:—They each drink a small quantity of the preparation of opium called "Amulpani" from the hands of the other; and this is recognised as making the ties of friendship inviolable. In certain localities, opium is consumed at funerals, marriages, betrothals, and other ceremonies. Among the Kathis of Kathiawar it would be considered an offence if the guest refused to take opium on occasions like these. In the Punjab, a large proportion of the adult male population take opium in small doses as a stimulant without much or any apparent harm. It is looked upon as a digestive and a very beneficial tonic for a man who has reached middle age.

9. To stop the use of opium in cases like these would be not only an unnecessary restriction on the freedom of the subject, but it might, and, I think, would, lead also to the increased consumption of alcohol. This fear was expressed by a great number of witnesses. The use of a stimulant should only be interfered with if it is proved that it leads to a general depravity in the moral character or to any marked physical deterioration of a community. Speaking generally of the whole of India, it does not appear to me that these essential conditions have been proved.

Poppy cultivation in Native States.

10. The evidence given on behalf of those Native States in which opium is grown, shows that there is a very strong feeling against any interference with the cultivation of the poppy; and I consider that it would be highly injudicious to adopt any restrictive measures in face of such strong and influential opposition. I here take the opportunity to make a few quotations from a "*Kharita*" addressed to the members of the Royal Opium Commission by H. H. the Maharaja Holkar, dated the 6th February 1894:—

> "(1.) In view of the relations existing between the Paramount Power and my "State, the former would not be justified in requiring me to prohibit the cultiva- "tion of opium in my State, except for medical purposes, even though it may itself "enforce such prohibition in British India.

"(2.) No money compensation can properly or adequately compensate the "State or the various classes affected by it for the losses which they will sustain.

"(3.) The prohibition will be oppressive to my subjects.

"(4.) As a rule, the consumption of opium in my State is moderate, and a "moderate use of opium is not prejudicial in any way.

"(5.) I have always found my subjects peaceful and law-abiding, and I "apprehend that interference with the present state of things will make (them) "discontented."

11. These are the views of one of the most enlightened native princes of India, who has besides the reputation of being one of the ablest revenue administrators that Malwa has ever produced. His views, moreover, were endorsed by nearly all the representatives of the States of Central India. This feeling against any interference with the opium trade is a very natural one. The suppression of the opium trade would seriously interfere with the financial equilibrium of many of the Native States; and it is impossible to foresee the consequences of such a step. The discontent and the dissatisfaction will be none the less a source of political danger, although they may not find open expression.

12. In this connexion, I wish to quote the answer given by Rao Bahadur K. C. Bedarkar the Prime Minister of the Indore State, to a question whether he considered it would be expedient (if it were rightful to do so) to bring the powers of the Paramount State into action in relation to this question of the poppy:—

22,202. *A.*—"My answer to this question is in the negative, and for the "following reasons:—

"(1.) The State would suffer a loss of about Rs. 21,000,000 annually, and would "gain no benefit for a sum of Rs. 33,000,000 sunk in wells and tanks.

"(2.) The agriculturists would suffer a loss of Rs. 18,56,190 annually, and "would get no proportionate return for a sum of 3 lakhs of rupees sunk by them "in wells within the last few years, and of other large sums spent by them in "previous years.

"(3.) The jagirdars would suffer to the extent of Rs. 1,63,500 annually.

"(4.) The traders would suffer a loss estimated at Rs. 8,50,000 annually, and "would find no good investment for nearly a crore and a half of rupees now "invested in the opium trade.

"(5.) No money compensation can adequately make up the loss, and it is "impracticable to apportion such compensation.

"(6.) The impracticability of carrying out preventive measures.

"(7.) There would be a resort to liquor, leading to physical deterioration, "moral and social degradation, breach of religious commandment, and increase "of crime.

"(8.) There would be grave discontent amongst the people, amounting to "political danger.

"(9.) No object shall be gained by making so much sacrifice and incurring so "much risk, as China will continue to grow and consume its own inferior opium, "in spite of all and everything."

The Bengal monopoly system.

13. I now come to the consideration of the Bengal Monopoly System. I am a staunch advocate of free trade principles, but as far as India is concerned, I am convinced that a Government monopoly like that of opium is one of the most popular and least oppressive systems of raising revenue. The unpopularity in India, of direct taxes such as the Income tax and the License tax, and the difficulty in making proper assessments are well known. I should be sorry to see this source of revenue replaced by any system of direct taxation which is likely to place the people at the mercy of a notoriously corrupt and ill-paid class of rural assessors.

14. There are two systems of opium cultivation practised in Bengal. Firstly, the Benares system of dealing directly with the ryots; secondly, the Patna or Behar system of dealing through middlemen. One thing is common to both of these systems, *i.e.*, advances are given to the ryots, and they are bound down by a written agreement to cultivate a certain area of land. This, in most cases, is a distinct advantage to the ryots, inasmuch as they get these advances without having to pay any interest.

15. I consider it, however, my duty to point out that the prices paid for opium up till last year had not varied for more than 20 years. During this period the country

has been opened up by a number of railways, and the cost of labour and food has increased enormously. In the course of the sittings of the Commission at Bankipur, it was brought to our notice that ryots, who had entered into agreements to cultivate the poppy, had in some cases failed to carry out the contract on account of the lowness of the price, and it was alleged that they had been compelled by the Opium Department to uproot the crops they had sown in the place of the poppy. On this question of price the evidence of Mr. A Forbes, the Commissioner of the Patna Division, was as follows:—

*Q.* 10,797.—"I presume, you think the people would view with regret the "enforcement of a policy of prohibition of the further cultivation of the poppy? "*A.*—Very much so. I consider that it would ruin thousands of them. I think, "myself, that the proper policy of Government would be to raise the Government "price of the poppy. I have very little doubt, if the Government price of opium "were raised from Rs. 6 a seer to Rs. 5·8 or certainly to Rs. 6, that it would "compete much more equally with the other crops which have risen with the fall "in the value of the rupee, which the Government price of poppy has not done."

16. It will be seen that Mr. Forbes is strongly in favour of raising the price of the poppy, and his opinion derives great weight from the fact of his having served on a Commission appointed by the Government of India about 13 years ago to inquire into the working of the Opium Department in Bengal and the North-West Provinces. Similar evidence is given by other witnesses like Babu Guru Prasad Sen, the Secretary of the Behar Landowner's Association, and Babu Saligram Singh, who is an influential landowner in that province, gave evidence to the effect that on account of the opening of new markets the opium cultivation is less profitable to the farmers than that of various other crops. In connexion with this subject, it should be pointed out that the Benares system of direct dealing with the ryots is very much more popular with landlords and tenants alike than the Behar system of dealing through middlemen or zillahdars. This latter system is considered by many to lead to much unnecessary oppression; and I would therefore propose the gradual introduction of the Benares system to Behar also.

17. In conclusion, I desire to record my appreciation of the courtesy and consideration shown to me during the sittings of the Commission in India by Lord Brassey and my colleagues. I was unfortunately prevented by ill-health from being present throughout the inquiry, and the delay in submitting this Note, which I much regret, must, I fear, be attributed to the same unavoidable cause.

LAKSHMESHWAR SINGH OF DARBHANGA.

# MINUTE OF APPOINTMENT.

At the Council Chamber, Whitehall,

This 18th day of March, 1895.

Present :

The Right Hon. James Bryce, M.P.

The Board of Trade are pleased to appoint the following gentlemen, viz. :—

The Right Hon. Sir Francis H. Jeune,
Sir Edward J. Harland, Bart., M.P.,
Sir Francis H. Evans, K.C.M.G., M.P.,
Rear-Admiral H. G. Andoe, C.B.,
Captain H. F. Hughes Hallett, R.N.,
Mr. Thomas Henry Ismay,
Mr. Thomas Scrutton,
Mr. Wilson Barker,
Mr. James Bolam,
Mr. John S. Castle,
Mr. Anthony S. Thomson,

to be a Committee to consider and report—

1. Whether the rule laid down in the Order in Council of January 30th, 1893, is in accord with, and calculated to secure compliance with, the requirements of Articles 3 and 15 of the International Regulations for Preventing Collisions at Sea, as to the fixing and screening of the side-lights of vessels.

2. Whether it is desirable in the interests of safety, and in order to secure due compliance with the above-named Articles, that any, and what, alterations should be made in the Instructions issued by the Board of Trade to their surveyors in the matter.

The Board of Trade are also pleased to appoint Mr. C. Hipwood to be Secretary to the Committee.

(Signed) JAMES BRYCE.

# REPORT.

TO THE RIGHT HONOURABLE THE PRESIDENT OF THE BOARD OF TRADE.

SIR, November 13th, 1895.

In compliance with the Minute of the 18th March we have considered:—

1. Whether the rule laid down in the Order in Council of January 30th, 1893, is in accord with, and calculated to secure compliance with, the requirements of Articles 3 and 15 of the International Regulations for preventing Collisions at Sea, as to the fixing and screening of the side-lights of vessels.

2. Whether it is desirable in the interests of safety, and in order to secure due compliance with the above-mentioned Articles, that any, and what, alterations should be made in the instructions issued by the Board of Trade to their surveyors in the matter.

The Order in Council of January 30th, 1893, in order to explain the Regulations contained in the schedule to an Order in Council of August 11th, 1884 (which are known as the International Regulations), modifies them by the addition to Article 3 of the following provision:—

"To ensure that the red and green side-lights shall show an uniform light from right ahead of the ship to two points abaft the beam on the port and starboard sides respectively, and shall not show across the bow of the ship itself, the said lights must be fixed, and the screens fitted, so that the rays from the red and green lights shall cross the line of the ship's keel projected ahead of the ship at a reasonable distance ahead of the ship.

"With regard to all vessels whose lights are inspected by the officers of the Board of Trade, the red or green side-light will not be deemed to be fixed and fitted in accordance with the Regulations, unless it is so fixed and screened that a line drawn from the outside edge of the wick to the foremost end of the inboard screen of such light shall make an angle of 4 degrees, or as near thereto as may be practicable, with a line drawn parallel with the keel of the ship from the outside edge of the wick."

It is, therefore, no part of the duty of this Committee to consider whether any amendment of the International Regulations be desirable, nor does the provision just quoted profess to effect any alterations in, but only to explain, the previous Order in Council. But it is clear that the later places an interpretation on the earlier Order, and further proceeds to decide a question of fact raised by such interpretation. The Order of January 1893 declares, in effect, that, according to the true construction of the Regulations, and in order to comply with them so understood, the rays from the red and green lights must cross the line of the ship's keel projected ahead of the ship at a reasonable distance from the ship, and, secondly, it determines what is such reasonable distance by ordering that the lights shall be screened to an angle of 4 degrees, or as near thereto as may be practicable, from the outside edge of the wick. The question at issue, and that to which all discussion on the interpretation of the Articles in question leads up, is at what angle, with regard to the light, should the screen be placed? It is, therefore, necessary, in the first place, to endeavour to ascertain how far the language of the International Regulations affords guidance on the subject.

Article 3 (*a*) provides as follows:—

"A seagoing steamship when under way shall carry—

"On or in front of the foremast at a height above the hull of not less than 20 feet, and if the breadth of the ship exceeds 20 feet, then at a height above the hull not less than such breadth, a bright white light, so constructed as to show an uniform and unbroken light over an arc of the horizon of 20 points of the compass, so fixed as to throw the light 10 points on each side of the ship, viz., from right ahead to two points abaft the beam on either side, and of such a character as to be visible on a dark night with a clear atmosphere of a distance of at least five miles."

This Article prescribes the construction, the position, and the character of the light, that is to say, the construction and position of the lantern with the light, or

*Sir Digby Murray.*

27 Mar. 1895.

"more than is possible; and secondly, to ensure that "the distance ahead within which neither light is "seen is not greater than can be avoided." Now that expresses the principle which from first to last has been before the mind of the Board of Trade?—Yes. The diagrams which illustrate the matter were never altered until 1892; they were then altered on my recommendation.

61. I think you were going to explain that there had been some mistake made in 1879 with regard to a confusion between the word "wick" and the word "lens"?—Yes, and I would ask you to alter it to 1875. I may say that these instructions are out of print, and it has been difficult for me to get copies of them, and when I asked for all the previous instructions they were sent to me without the re-issue in 1875, and I find that that mistake occurred in the first place in 1875. I presume I need not allude to the instructions of 1872, which are identical with those of 1868.

62. Were these instructions of 1868 repeated in subsequent years?—Yes, in 1872 they were, and they have practically been repeated up to 1892, with the exception of the error to which I am about to call your attention. You will observe in the first place that this paragraph in the Instructions of 1875, to which I call your attention, is perfectly correct.

63. I will read it, with the Committee's permission:—"Or a chock equal in thickness to the "distance between the inner edge of the lens and "the side of the screen may be secured to the "fore end of the screen, or the lamp may be so "placed that the outside of the screen will come "against the inner edge of the lens"; so that the word in both cases is "lens"?—But in the next paragraph you will see the word "wick" has been substituted for the word "lens."

64. Later on in these same Instructions of 1875 occurs this passage: "For both lights to be seen ahead it is "necessary that the red and green rays should cross at "a certain distance ahead. Surveyors will probably find "that if the inboard edge of the *wick* touches a line "parallel with the keel of the ship, and that cuts "the outer edge of the forward end of the inboard "screen, the rays will cross suitably." Then was that a mere misprint?—It was entirely a misprint, as is shown not only by the former passage, but also by the drawings, which are exactly the same as they were before. It is a misprint for the word "lens."

65. The intention was that it should be the edge of the lens that should regulate the depth of the chock and not the edge of the wick?—Yes; if it was regulated from the inner edge of the wick, the screening would be remarkably fine; in the case of a 1-inch wick, placed at right angles to the ship's keel, it would give an angle of 1° 35′, but if the wick was placed parallel with the chord of the arc, which is of the two more frequently the case, the angle would be 1° 16′.

66. Then when was the error corrected?—It was not corrected until 1887. It never came under the notice of anybody. The clerk who ought to have read it and compared it seems to have overlooked it.

67. The view the Board of Trade took was that this was a mistake, and they acted upon it by remedying it, as I understand, in 1887?—Yes. I may say that the Board of Trade Surveyors have always construed it as if it were the inner edge of the *lens*, not the edge of the *wick*. In the Instructions of 1887 you may see that the line drawn from the inner edge of the lens to the outer edge of the chock is called the line of reference. In the Instructions of 1891, which were the next, this line is printed in the same way as the line of reference.

68. And I see in both cases the line of reference is a line from the edge of the chock to the edge of the lens?—From the inner edge of the lens to the chock.

69. So that those diagrams clearly show that the inner edge of the lens is intended and not the inner edge of the wick?—Yes, and you will see that the earliest diagrams—those of 1868—were never altered until 1892.

70. Were the same instructions worked upon both in 1887 and again in 1891?—Yes.

71. Were those instructions the instructions in force up to the recent alteration in them which is really now in question?—Yes, until 1892.

72. Perhaps you will kindly read to the Committee the instructions of the Board of Trade which are now in force?—"Side lights are always to be "screened to an angle of 4°, and are to be fitted "as follows, excepting when in turrets, in which case "it may be thought desirable so to arrange the "screens as to dispense with chocks, *see* Plate 1. "When the screens are fitted as in Figs. 3 and 4, "Plate 2, the outer wall of the screen is to be con-"sidered as the chock."* And then there is a drawing which shows exactly how they are to be screened.

73. Can you state to what angle the lights would be screened from the outer edge of the wick if the suggestions contained in the *old* Instructions had been complied with by the surveyors?—The mean in the case of lamps of the patterns in use prior to 1892 would be 4° 30′.† I put in a list of a number of measurements which were taken. The measurements were made by myself, and perhaps it would be convenient to you, either now or presently, for me to show how those measurements were made. There is a diagram here which shows it.

74. I think it would be convenient at the present moment. (*A diagram was produced*)?—The measurements in each case were taken from the inner side of the lantern to the outer edge of the wick. Subsequently to that the measurement was taken from the inner side of the lantern to the inner edge of the lens. Then this latter measurement was deducted from the larger measurement, and the difference was of course the tangent of the angle.

75. (*Sir F. Evans.*) The tangent of the angle at what point?—The tangent of the angle corresponding to a length of screen of 36 inches.

76. (*Sir E. Harland.*) Is that with the object of setting off the thickness of the chock?—Yes, the diagram shows the depth of chock required for angles of from 1° to 4°, but this particular depth of chock corresponds to a screening of 4°.

77. (*Mr. Ismay.*) According to the present practice?—The angle, yes; but the position of the wick is not in accordance with the present practice, because we now suggest that the centre of the wick shall be the centre of the curvature of the lens. We had a little trouble about it, for some makers set back the wick, without altering the construction of the lamp.

78. (*Chairman.*) I think it is your opinion, is it not, that the effect of this rule as to 4° in point of fact has decreased and not increased the actual angle of screening?—Yes, that is actually the case. I put in a statement prepared by the Secretary of the Rule of the Road Committee, which shows what has actually been the effect of the 4° rule.

79. It is in your view, is it not, undoubtedly the case that the angle before 1892 was a larger angle than 4°?—There is no doubt about it. I shall be able to put further evidence before you to show that that was the case.

80. Does this summary of the reports from the various districts, which you have put in, show that the angle was never less than 4°, though in many cases it appears to have gone up to as much as 10°?—No, the angle has been less than 4° in some cases, but in the majority of cases it has been either 4° or over. There are a number of measurements given in another paper which I propose to put in and they show that the angle has been smaller than 4° in some cases. On the other hand it appears from a return which was handed in to the Rule of the Road Committee by the marine superintendent of the Peninsular and Oriental Company that in 80 per cent. of their vessels the lights were screened to 4° or over, prior to their being rescreened in accordance with the 1892 Instructions.

---

* *See* Appendix 2, No. 1.
† *See* Q. 4020, 5057-9.

the area within which both lights are visible be closely limited it is clear that this object would be frustrated, and that those on board a vessel seeing both lights of another would have imperfect information as to her direction, and would be ignorant how, with regard to her, their own course should be directed.

It was therefore provided by Article 3 (*d*) :—

"The said green and red side lights shall be fitted with inboard screens projecting at least 3 feet forward from the light, so as to prevent these lights from being seen across the bow."

Now from these words can it be gathered in what position the screens should be placed as regards the lights, that is to say, the sources of light in the lanterns? The Committee think that it can. It is, in their opinion, clear that no part of the screen must impede the full light being seen ahead where otherwise it would be exhibited, or, in other words, the foremost end of the screen must not pass a line drawn from the inside edge of the source of light parallel to the keel, because, if it does, the preceding provision as to the uniform light of a lamp in the prescribed position being seen over 10 points of the horizon is infringed. That gives the extreme permissible limit of the foremost end of the screen outwards from the ship. As regards its position in the reverse direction, or away from the source of light, there is no express provision. But the object being, as has been said, to confine the area within which both lights can be seen, it would seem, in the absence of directions to the contrary, that the arrangement which limits it most closely is the one intended. Again: the minimum length of the screen is prescribed. It is to be at least 3 feet long. Unless the position of the screen as regards the light be postulated this is a meaningless provision; and the reasonable conclusion would appear to be that it was assumed that the edge of the screen would, like the edge of the lens, be in a line with the edge of the source of light and parallel with the keel. In that view, the provision is intelligible and consistent. The screen is not to prevent any part of the full light being seen ahead, but, without doing this, it is to cut off as much of the crossing light as can be intercepted by a screen of at least 3 feet long, the discretionary extension of length beyond 3 feet being, probably, intended to meet special cases. Its foremost edge, therefore, must be in a line right ahead, or parallel with the keel, from the inner edge of the source of light.

It was said above that a lamp showing a full light with theoretical exactness ahead of itself in a line parallel with the ship's keel will show a light of almost the same power ahead of the stem at a short distance from it. It will do nearly the same thing even if screened as just suggested. The Committee have thought it desirable to make careful experiments on this point, and the result, beyond question, is that lights so screened* are in every case seen in their full strength ahead of the lamp, and, at distances of and over 500 yards, are seen in full, or almost full, strength on the line of the ship's keel projected, and, to anyone approaching the ship on that line, remain clearly visible to a distance of about 60 yards from the lamps themselves. The electric light† so screened can be seen at 500 yards, and upwards, in full strength on the centre line, and remains visible, as the ship is approached, on that line to about 55 yards from the lamps. It has been urged, with regard to the finer degrees of screening, that there would be produced in front of the stem a space within which no light would be visible, which has been, in popular language, described as a "dark lane." It is clear from the results of the experiments of the Committee that the mode of screening recommended by them will, in fact, create no such dark lane. Within every distance that is material, the lights on a vessel remain perceptible on a projected line of her keel.

The Committee have up to this time used the phrase "source of light" in order not to prejudice the question whether, in an oil lamp, the position of the screen should be regulated with regard to the wick or its flame. But, at this point, they may conveniently say that, though authorities deserving respect have considered that the flame should be treated as the source of light, they see no reason to differ from the view of the Board of Trade that the wick may, for practical purposes, be so treated. The breadth of the flame beyond the wick of an oil lamp varies so considerably in different lamps, and under changing circumstances, that it would be difficult, if not impossible, to frame a workable rule in reference to it, and the Committee do not think any theoretical

* The experiments were conducted with a wick $\frac{1}{2}$ of an inch broad, placed at an angle of 44° from the line of the keel, and a screen 3 feet long from the wick, and a distance of 45 feet between the lamps. *See* Appendix, No. 9.

† *See* Appendix, No. 12.

source of light, within it, and the character or power of that source of light. The lantern is to be so constructed as to show a uniform and unbroken light over an arc of the horizon of 20 points. It is obvious that this is intended to be secured by the width of the aperture containing the glass lens, or, in other words, that the edges of the frame containing the lens shall, by their relation to the source of light, allow that light to be uniformly exhibited over 20 points of the compass. Next, the position of the lantern is to be such that these 20 points are the 20 points from two points abaft the beam on one side, round, and ahead of, the ship to two points abaft the beam on the other side. The construction of the lantern determines the magnitude of the equally illuminated arc; the position of the lantern determines the situation of that arc. We need not at present concern ourselves with the power of the light.

Then follow provisions as to the side-lights clearly intended to be consonant with those as to the masthead light.

Article 3 (*b*) provides as to the green light, Article 3 (*c*) making a corresponding provision as to the red light, as follows:—

"On the starboard side, a green light so constructed as to show an uniform and unbroken light over an arc of the horizon of 10 points of the compass, so fixed as to throw the light from right ahead to two points abaft the beam on the starboard side, and of such a character as to be visible on a dark night with a clear atmosphere at a distance of at least two miles."

It would seem indisputable, but it is most important to observe, that, as in the case of the masthead light, the lantern of the green lamp is to be so constructed as to determine the magnitude of the arc over which a uniform light is to be exhibited. It is to show such a light over 10 points, and 10 points only, of the horizon. Then, it, and the corresponding red light, are so to be placed that together they exhibit their light uniformly over 20 points of the horizon, clearly the same 20 points as are illuminated by the uniform strength of the masthead light, as the limits abaft the beam are identical.

The question has been much discussed whether the words "right ahead" in Article 3 (*b*) and (*c*) mean ahead of the light or ahead of the ship. The Committee think it probable that the framers of the Article did not intend to draw any distinction between ahead of the lamp and ahead of the ship, did not consider that the phrase "right ahead" should be limited to the line of the ship's keel projected, and treated anything within the space formed by two lines parallel with the keel and separated by the breadth of the beam as ahead of the ship. But the question does not appear to be of practical importance. When once it is understood to be directed that by means of the relation between the two edges of the lens and the source of light in the lantern, the exhibition of the light in its full volume shall take place over an arc of 10 points, neither more nor less, it is obvious that, strictly and theoretically, a direction that the full light shall be exhibited from right ahead of the stem of the ship to two points abaft the beam of the ship cannot be complied with, nor if right ahead be understood to mean right ahead of the lamp, can the direction be complied with unless the lamp be placed precisely amidships. It cannot have been intended that such a position should be the only permissible position of the light. The inference is that the terms of the rule are to be followed only with the best practicable exactness; and they certainly are so complied with, if, wherever, on or near the ship's bulwarks, the light is exhibited, the full volume of light is thrown forward in a line parallel with the keel of the vessel. So placed, the two side lamps will together, so far as is possible, show their full volume of light over the same 20 points as those over which the full light of the masthead light is exhibited. Of course if the lights be placed even, as possibly in some cases originally they were placed, at the stem of the vessel, the full light will not be shown within a space ahead of the ship equal to the breadth between the lights, but on whatever part of the ship's side the lamp be placed, so much of the light will be seen on a centre line from the ship's stem at no great distance from it as to have practically the same effect as the whole.

It is obvious, however, that if the red and green lights respectively throw a uniform or full light over two equal arcs of the horizon, such arcs meeting, or nearly meeting, right ahead of the ship, not the whole, but a part, of the lights of the two lamps must cross somewhere on a projected line of the ship's keel. Article 15 indicates, and the same thing will be presently shown to have been the express object of those by whom screens were first introduced, that both lights should not be seen at the same moment from any direction but that of right ahead, or, in other words, when the lights are exhibited by a vessel approaching end on or nearly end on. Unless

the area within which both lights are visible be closely limited it is clear that this object would be frustrated, and that those on board a vessel seeing both lights of another would have imperfect information as to her direction, and would be ignorant how, with regard to her, their own course should be directed.

It was therefore provided by Article 3 (*d*) :—

"The said green and red side lights shall be fitted with inboard screens projecting at least 3 feet forward from the light, so as to prevent these lights from being seen across the bow."

Now from these words can it be gathered in what position the screens should be placed as regards the lights, that is to say, the sources of light in the lanterns? The Committee think that it can. It is, in their opinion, clear that no part of the screen must impede the full light being seen ahead where otherwise it would be exhibited, or, in other words, the foremost end of the screen must not pass a line drawn from the inside edge of the source of light parallel to the keel, because, if it does, the preceding provision as to the uniform light of a lamp in the prescribed position being seen over 10 points of the horizon is infringed. That gives the extreme permissible limit of the foremost end of the screen outwards from the ship. As regards its position in the reverse direction, or away from the source of light, there is no express provision. But the object being, as has been said, to confine the area within which both lights can be seen, it would seem, in the absence of directions to the contrary, that the arrangement which limits it most closely is the one intended. Again: the minimum length of the screen is prescribed. It is to be at least 3 feet long. Unless the position of the screen as regards the light be postulated this is a meaningless provision; and the reasonable conclusion would appear to be that it was assumed that the edge of the screen would, like the edge of the lens, be in a line with the edge of the source of light and parallel with the keel. In that view, the provision is intelligible and consistent. The screen is not to prevent any part of the full light being seen ahead, but, without doing this, it is to cut off as much of the crossing light as can be intercepted by a screen of at least 3 feet long, the discretionary extension of length beyond 3 feet being, probably, intended to meet special cases. Its foremost edge, therefore, must be in a line right ahead, or parallel with the keel, from the inner edge of the source of light.

It was said above that a lamp showing a full light with theoretical exactness ahead of itself in a line parallel with the ship's keel will show a light of almost the same power ahead of the stem at a short distance from it. It will do nearly the same thing even if screened as just suggested. The Committee have thought it desirable to make careful experiments on this point, and the result, beyond question, is that lights so screened* are in every case seen in their full strength ahead of the lamp, and, at distances of and over 500 yards, are seen in full, or almost full, strength on the line of the ship's keel projected, and, to anyone approaching the ship on that line, remain clearly visible to a distance of about 60 yards from the lamps themselves. The electric light† so screened can be seen at 500 yards, and upwards, in full strength on the centre line, and remains visible, as the ship is approached, on that line to about 55 yards from the lamps. It has been urged, with regard to the finer degrees of screening, that there would be produced in front of the stem a space within which no light would be visible, which has been, in popular language, described as a "dark lane." It is clear from the results of the experiments of the Committee that the mode of screening recommended by them will, in fact, create no such dark lane. Within every distance that is material, the lights on a vessel remain perceptible on a projected line of her keel.

The Committee have up to this time used the phrase "source of light" in order not to prejudice the question whether, in an oil lamp, the position of the screen should be regulated with regard to the wick or its flame. But, at this point, they may conveniently say that, though authorities deserving respect have considered that the flame should be treated as the source of light, they see no reason to differ from the view of the Board of Trade that the wick may, for practical purposes, be so treated. The breadth of the flame beyond the wick of an oil lamp varies so considerably in different lamps, and under changing circumstances, that it would be difficult, if not impossible, to frame a workable rule in reference to it, and the Committee do not think any theoretical

* The experiments were conducted with a wick $\frac{1}{2}$ of an inch broad, placed at an angle of 44 from the line of the keel, and a screen 3 feet long from the wick, and a distance of 45 feet between the lamps. *See* Appendix, No. 9.

† *See* Appendix, No. 12.

error of sufficient practical importance to render it necessary to make the attempt The wick, in an oil lamp, may, therefore, be treated as the source of light, and will be herein-after so referred to.

The Committee think that the interpretation of Article 3, which commends itself to their minds, derives material support from reference to the earlier Orders in which the Regulations were embodied.

Attention was drawn to the want of a uniform system of night signals for steamers by the reports of a Committee of the House of Commons and a Royal Commission in 1831 and 1836, and the general adoption of side-lights was recommended in a report made to the Board of Trade in 1839.* On the 11th of July 1848 the Admiralty, under the powers of the Act 9 & 10 Vict. c. 100., made an Order† which, so far as is material in regard to the masthead and side-lights of steamships under weigh, and the screening of side-lights, was as follows :—

1. "The masthead light to be visible at least 5 miles in a clear dark night, and the lantern to be so constructed as to show a uniform and unbroken light over an arc of the horizon of 20 points of the compass, viz., from right ahead to two points abaft the beam on each side of the ship. 2. The coloured side-lights to be visible at a distance of at least 2 miles in a clear dark night, and the lanterns to be so constructed as to show a uniform and unbroken light over an arc of the horizon of 10 points of the compass, viz., from right ahead to two points abaft the beam, on their respective sides. 3. The side-lights to be moreover fitted with inboard screens of at least 3 feet long to prevent them from being seen across the bow. The screens to be placed in a fore-and-aft line with the inner edge of the side-lights."

Before the promulgation of this Order the Admiralty had issued a paper‡ which is of importance as an authoritative statement explaining the purpose and effect of screens at their first introduction. It was pointed out in this document that the objects of lights are to indicate not only whether an approaching vessel be a steamer, and whether she be under weigh, but also the direction of her head, and diagrams were subjoined showing the masthead light and the red and green lights, and then the paper proceeds to say :—

"The manner of fixing the coloured lights should be particularly attended to. They would require to be fitted each with a screen of wood or canvas on the inboard side, in order to prevent both being seen at the same moment from any direction but that of right ahead. This is important, for without the screens (a principle first introduced with this plan) any plan of bow lights would be ineffective as a means of indicating the direction of steering."

On the 1st of May 1852,† under the powers of the Act 14 & 15 Vict. c. 79., the Admiralty again issued orders on the subject of ships' lights. The only alteration other than verbal which it is material to observe is that the direction, "the screens to "be placed in a fore-and-aft line with the inner edge of the side-lights," was omitted.

On the 5th March 1858† revised Regulations were issued by the Admiralty, which differ only verbally from those previously in force. For them were substituted Regulations practically identical as to screening in 1862; and from that time until the Order in Council of January 1893 no change was made in the Regulations on this subject.

It would seem therefore clear that from 1849 to 1893 the Regulations as regards side-lights and their screening were intended to be in effect the same. We find that at all times the magnitude of the arc on the horizon over which a uniform light is to be shown, is to be determined by the construction of the lantern; and we find also that, on the first introduction of screens, their object was to prevent "both lights being seen at the same moment from any direction but that of right ahead,"§ and that this was to be accomplished by the direction, "the screens to be placed in a fore-and-aft line with the inner edge of the side-lights."† It appears to the Committee impossible to avoid the inference, that the intention of this direction was that the screens should be placed so as to intercept as much of the cross light as possible consistently with the full light being thrown ahead.

Two views differing from the interpretation which the Committee place on the language of the Regulations have been maintained.

Both of these views rest on the construction placed on the words "so as to prevent the light from being seen across the bow."

* Questions 6 and 7. † *See* Appendix 1, No. 1. ‡ *See* Questions 10 to 13.
§ *See* Question 13.

The advocates of the first view understand the words "the light" to mean not the full light only but any rays of it, and the words "across the bow" not to be limited to a point on the stem of the vessel but to extend to all distances ahead of the stem. Accordingly they contend that the lights must be screened in a line parallel with the keel from the outer edge of the wick. But to this view there appears to be the grave objection that it renders Article 3 (*d*) inconsistent with (*b*) and (*c*). If the light be so screened its full power will not be exhibited right ahead either of the lamp or the ship, and the 10 points over which the uniform light is to be shown is reduced. It may indeed be said that Article 3 (*d*) is to be read as modifying (*b*) and (*c*). But the language is not apt for that purpose. It is clear that the prescribed length of the screen is to promote the stated object of the provisions. But if the whole wick be screened the longer the screen the less the area of obscuration ahead.* Again: there are practical objections to such a mode of screening which appear to render the interpretation on which it is based improbable. In this case there is no doubt a space within which no light can be seen, or, what has been called, a "dark lane" ahead of the ship. Different views may be entertained of the weight of the practical objections to it, but it is difficult to suppose that the framers of the regulations, when they said that the lights should not be seen across the bow, meant that neither light should be seen ahead of it. The Committee do not dwell longer on this view because it has not received any general support.

The second view, in order to avoid inconsistency between Article 3 (*d*) and (*b*) and (*c*), suggests that the words "to prevent the lights from being seen across the bow" mean from being seen across the bow at the stem, and that, therefore, a screen would comply with these provisions of the article if it prevented the most convergent rays of light being seen at the actual head of the vessel. This interpretation has received the sanction of Law Officers of the Crown, and it is probably the construction upon which the present Order in Council is based. But the Committee not only feel the greatest difficulty in limiting the phrase "across the bow," well understood as it is in ordinary use, to a special meaning of a line crossing the actual stem, but other arguments appear to them to militate against the above view. If the intention was only to prevent the light being seen at the stem it would have been easy to have said so, and unnecessary to have prescribed any length for the screen. It is an even more forcible consideration that no responsible authority has, so far as the Committee are aware, yet advocated the light crossing at the bows of the vessel. On the contrary, the terms of the present Order, and the discussions which led up to it, repudiate such a practice.

The Committee now turn to the Instructions to Surveyors which were issued by the Board of Trade in order to secure compliance with the Regulations for Preventing Collisions at Sea. The first of them appeared in 1868,† and successive Instructions, each superseding the former, were issued in 1872, 1875, 1879, 1884, 1887, and 1891. In 1868 the attention of the authorities of the Board of Trade was called to the difficulty which existed in determining how the screens should be fixed and to the diversity of practice which prevailed as to the angle at which the side-lights were screened. After consultation with the Admiralty and with the Trinity House, Instructions, accompanied with diagrams, were issued by the Board of Trade in September 1868. The terms of these Instructions, so far as is material in reference to this present question, were repeated with only one significant variation, and the diagrams without variation, until Instructions similar to those at present in force were issued in 1892. It may be doubted whether the conditions of the question presented themselves very clearly to the minds of the framers of the earliest Instructions. The problem is thus stated in language that is certainly obscure and even self-contradictory: "The real "points to be studied in fixing and arranging the inboard screens appear to be—

"*First*.—To ensure that the rays of the red and green side-lights do not cross each "other immediately on leaving the ship, nor at all more than is possible;

"*Secondly*.—To ensure that the distance ahead within which neither light is seen "is not greater than can be avoided."

Of these two requirements the former would seem to insist on the dark space ahead of the ship being as large, the second on its being as small as possible. The Instructions proceeded to direct that the screens should obscure the light in a line parallel with the keel from the inner edge of the lens. Now, had the lamps been constructed as in strictness they should have been, that is to say, with the inner edge of the lens in a

* A sketch illustrating this will be found in Appendix 22.

† *See* Appendix 1, No. 2

line parallel with the keel in relation to the inner edge of the wick, such an Instruction would have ensured uniformity, and would have produced the results which the Committee think were intended by the Regulations for preventing Collisions at Sea.*

But it is remarkable that, though the Instructions prescribed screening to the inner edge of the lens, nothing was said from which the position of the inner edge of the lens relative to the wick was to be gathered. It is difficult to suppose that unless it was assumed that the edge of the lens had some fixed relation to the source of light there should have been such an omission, or that it should have escaped observation that, with that relation left undetermined, the Instructions would fail to give any direction of utility to the surveyors, or to produce uniformity in the effect of screening. The obvious inference is that originally it was taken for granted that the edge of the lens would be in a line drawn parallel with the keel from the inner edge of the wick, and this inference is strengthened by the fact that in the editions of the Instructions issued in 1875, 1879, and 1884, and not altered till 1887, the following direction occurs:—"Surveyors will probably find that if the inboard edge of the wick touch "a line that is parallel with the keel of the ship, and that cuts the outer edge of "the forward end of the inboard screen, the rays will cross suitably. Surveyors "should give this subject their serious consideration." We have been assured† that this is a printer's error of "wick" for "lens," but the acceptance of this view leads the Committee to think that no distinction between the two was supposed to exist. No doubt the diagrams and text illustrated by them, which remained unchanged throughout, tend to indicate, though imperfectly, that a screening to the inner edge of the lens was intended, and that the inner edge of the wick was not contemplated as being, necessarily at least, in a direct fore-and-aft line with it. We have, however, been informed‡ by a naval officer whose attention was specially directed to this subject in 1868, and who was in communication with the Board of Trade after that date, that he understood that, at that time, the responsible advisers of the Board agreed with his own view, that the screening should be to the inner edge of the wick. And, unless for this purpose, the terms "wick" and "lens" were considered convertible, it is not easy to see how such an error escaped immediate observation, and, certainly the direction to the surveyors would have been too inexact to serve the purpose it professed to accomplish. Further, it is clear that any discrepancy between "wick" and "lens" remained unnoticed for twelve years, and through two renewed editions of the Instructions. During that time many of the surveyors must have directed screening to the inner edge of the wick without correction from their superiors. It would also appear, from answers to questions addressed by ourselves, that several leading firms of shipowners§ and a lamp maker of the greatest experience,‖ as well as practical seamen,¶ were, and still are, under the impression that, before the present Order in Council, the Instructions directed screening to the inner edge of the wick, a belief apparently shared by at least one foreign country.**

In 1887 the whole sentence just quoted, containing the directions as to screening to the inside edge of the wick, was withdrawn from the Instructions then issued. The same indication as before was given by the diagrams and the accompanying text, as to screening to the edge of the lens. Further, a table was introduced showing the distances at which the most convergent rays would cross in vessels of 20 and 40 feet beam respectively, with different lengths of screens and different positions of the most convergent ray of light in the lamp in regard to what was termed "the line of reference," that is to say, a line drawn through the inner edge of the lens parallel with the keel. But nothing was said to guide the decision of the surveyor as to what length of screen, or what distance of the most convergent ray from the line of reference, should be selected, and so no guide as to the angle of screening was afforded. It would appear, therefore, that the principle of screening to the inner edge of the wick at one time, though perhaps imperfectly, apprehended, had been forgotten, or departed from, and no other principle, determining the angle of screening, adopted in its place.

It was the natural result, and beyond question was the case, that under the Instructions in force before the present orders, great variety of screening prevailed.†† The facts as to the actual screening in force before the present Order in Council have received much investigation, and the result would appear to be that, while in many

instances, and especially in the cases of vessels of high class, and belonging to well-known lines of steamers, a finer angle than the 4° prescribed by the present Order existed, in a very great number of vessels the screening was at a greater angle. We were informed by Sir Digby Murray* that in the case of lamps of the pattern in use previous to 1892, screening to the inner edge of the lens would give an angle equivalent, in the mean, to one not exceeding 4 degrees from the outer edge of the wick. The Committee are inclined to think that in many, perhaps the majority of, cases sailors believed that the lights were screened more finely than in fact was the case, and that the light from the side-lights was seen but little across the path of the vessel. It may well be that similar beliefs were entertained by surveyors of the Board of Trade, and that for this reason the great divergence of practice failed to attract the attention which it would otherwise have excited.

The Regulations for preventing Collisions at Sea assumed an international character by virtue of an agreement between England and France in 1862, and a very large number of the Powers subsequently acceded to them. The International Marine Conference assembled at Washington in October 1889. As regards the screening of side-lights, the Conference did not recommend any alteration of the international Regulations, but they passed a resolution in the following terms: "Side-lights should "be so screened as to prevent the most convergent rays of the light being seen "more than half a point across the bow."† The authority of this resolution is invoked by those who advocate the degree of screening enforced by the Order in Council of January 1893. But a perusal of the proceedings of the Conference will show that it was not so much the proper angle of screening that was insisted on, as the necessity of some of the rays of light crossing at some point ahead of the vessel, and the advantages of a uniform rule on the subject. Indeed, it would appear that the Conference proceeded in the belief that the Board of Trade had laid down a rule that the rays should not cross at a less distance from the ship than five ‡ times a breadth of the beam, and based the half point recommended by them on their view of these Instructions, whereas no such direction was, as we have seen, issued by the Board of Trade, and in fact the figures in the table above described give a result varying from $5\frac{1}{4}$ to $13\frac{1}{2}$ beams, the average being about $8\frac{1}{2}$ beams. But the actual angle of screening was clearly not considered of importance. The representative of Germany, by which Power the resolution was proposed, appears to have said §: "If half a point would "not be acceptable to any of the Governments, I think it would be very easy to "alter it accordingly, or so as to make it one point. I would state here that it really "makes but very little difference whether the limit is given at half a point or a point, "or a point and a half, if only one can rely upon it that in every ship the limit is "complied with." The representative of France said ‖: "Two systems are in the "presence of each other, one in which the lights do not cross except at an infinite "distance, the other when the lights cross at a defined distance. But what matters "the system provided the solution be uniform?"

The present Order was issued on January 30, 1893. At the close of that year it was with other matters submitted to the consideration of a Departmental Committee of the Board of Trade, consisting of persons of high authority. The Committee reported, ¶ on December 8, 1893: "We consider that the rule now in force under "the Order in Council of January 1893 merely confirms the previous practice of the "Board of Trade, and that the method of measurement now laid down is better "calculated to ensure uniformity of screening, and as this practice has up to the "present time worked well we see no necessity for the rule being altered. At the "same time, we desire to point out that no strict uniformity of the angle at which "the full strength of the lights is in practice visible is possible so long as a great "variety of patterns of lamps are in use, and in view of this fact, as well as of the "great improvements which have been and are being made in the construction of "lamps, and in the power of illuminants, and of the great increase in the size and "speed of ships, we think that the Board of Trade should in certain cases, upon the "request of the shipowner, have power to allow the angle of screening to be reduced "to 3°, or in special cases to even less than that angle."

It will be seen, therefore, that, though following different paths of reasoning, the Committee find themselves in agreement not only with the framers of the Order of January 30, 1893, but with the Washington Conference, and the Committee just referred to, to the effect that, under the International Regulations, some portion of the

* Questions 73, 105, 4920, 5057–9. † Parl. Paper, C. 6255, p. 198. ‡ *See* Question 3185.
§ Parl. Paper. C. 6255, 189. ‖ Parl. Paper, C. 6255, p. 197. ¶ *See* Appendix 1, No. 4.

rays from the side-lights must cross at some point directly ahead of the stem of the vessel. They further agree with the principle carried out by the Order of January 30, 1893, of fixing the position of the screen by relation to the wick.

Proceeding on their view of the interpretation of the International Regulations, the Committee find themselves at variance with the practical conclusion of the present Order to the extent of the difference between a screening of 4° from the outside edge of the wick and a screening from the inside edge of the wick, a difference which with an inch wick and a 3-foot screen amounts to about two degrees and a half. But the Committee do not consider that the Washington Conference, or the Committee of 1893, gave the weight of their authority so completely to any particular angle of screening, though no doubt both bodies approved a degree of screening broader than that which commends itself to the Committee, as to impress the Committee with the sense of serious difference from them on this point.

The Committee would, however, have hesitated to attach to the International Regulations the sense which they have suggested, had it failed to commend itself, in its practical application and consequences, to the minds of men of nautical knowledge. The Committee are also the more anxious to bring the matter to the test of practical experience, because, if they have the misfortune to differ from the construction of the Regulations adopted in the Order in Council under consideration, it will be observed that the only conclusion drawn by the framers of the Order from their interpretation of the Regulations is that "the rays from the red and green lights shall cross the "line of the ship's keel projected ahead of the ship at a reasonable distance ahead of "the ship." What, then, is such a reasonable distance, and how is its attainment to be regulated? The answer supplied by the Order is that the rule should be contained in a direction to screen at an angle of 4° from the outside of the wick, and the question arises, is this the best angle of screening?

The Committee have given the most careful consideration in their power to the question presenting itself to them in this form.

The question confines itself practically within narrow limits. The authority of the Order is given to an angle of 4° from the outside of the wick. It may be safely said that, with the exception of the Washington Conference, no important authority has countenanced any broader angle than this. On the other hand, although a screening which obscures a part or the whole of the wick from being seen from right ahead of it has found favour with some persons of experience, the Committee consider it not only excluded by the terms of the Regulations, but also not supported by sufficient weight of practical authority to necessitate prolonged consideration.

The Committee entertain no doubt that as between a broader and a finer mode of screening the balance of nautical knowledge and experience is in favour of the finer. It cannot be doubted that the present Order in Council was received, and is regarded, by shipowners, and by those practically engaged in navigation, with general disapproval. We have investigated this point with care, and the evidence before us has placed the fact of this disapproval, in our opinion, beyond question.

It is said, however, that this disapproval, general as it may be, rests on a mistaken appreciation of the facts, and that in reality the degree of screening prescribed by the present Order is a finer, and not a broader, angle than that in very many, or even the majority of, cases previously existing. There is no doubt great force in this observation. As was said above, the Instructions of the Board of Trade before the present Order were not calculated to produce, and did not produce, uniformity. The Committee do not doubt that many shipowners, many masters, and many pilots were unaware of the angle of screening of the vessels they owned or navigated; it was, indeed, a widespread belief that the side-lights were not seen on the opposite bow. But the Committee are nevertheless not disposed to undervalue the general opinion of men of practical experience when, though perhaps for the first time, the matter is brought clearly to their attention, and sufficient time has elapsed to allow opinion to be fairly formed upon it.

The points at issue have been subjected to much practical discussion, but the result may be stated shortly.

One main consideration appears to underlie the views of those who advocate a screening as broad as 4° from the outside edge of the wick, and especially of the advisers of the Board of Trade. It is that with a finer screening each of two vessels approaching each other on opposite and parallel courses might see only one light of the other, and yet the two vessels keeping their courses would collide. Thus, it is said, would arise a position of danger in which the International Regulations afford

no guide. Nay, more, the inference from them—correctly, it is contended—expressed in the well-known verses of Mr. Thomas Gray—

Green to green, or red to red,
Perfect safety, go ahead;

would become mistaken and misleading. A vessel having the green light of another vessel opposed to her own green light would not be in perfect safety if the courses of both vessels remain unaltered.

In support of this argument reference is made to the 15th Article of the International Regulations. That Article provides:—

"If two ships under steam are meeting end on, or nearly end on, so as to involve risk of collision, each shall alter her course to starboard, so that each may pass on the port side of the other.

"This article only applies to cases where ships are meeting end on, or nearly end on, in such a manner as to involve risk of collision, and does not apply to two ships which must, if both keep on their respective courses, pass clear of each other.

"The only cases to which it does apply are, when each of the two ships is end on, or nearly end on, to the other; in other words, to cases in which by day each ship sees the masts of the other in a line, or nearly in a line, with her own; and by night to cases in which each ship is in such a position as to see both the side-lights of the other.

"It does not apply by day to cases in which a ship sees another ahead crossing her own course; or by night to cases where the red light of one ship is opposed to the red light of the other, or where the green light of one ship is opposed to the green light of the other, or where a red light without a green light, or a green light without a red light, is seen ahead, or where both green and red lights are seen anywhere but ahead."

In view of this Article it is argued that the position of ships with regard to each other which imposes by day the obligation on each to port is intended to impose the same obligation by night, but that the latter obligation will not arise unless the lights be so screened that two vessels see both lights of each other in every case in which by day-light they would be visibly end on, or nearly end on. Then it is said that vessels approaching each other at angles up to and including 4° would in daytime be considered by competent navigators end on or nearly end on, and so should port.

What is substantially the same argument has been forcibly expressed* in the following form: "Let me put two questions. A. is a steamship steering due W.; "B. is a steamship two degrees on A.'s starboard bow, and steering E. two degrees S., "*i.e.*, directly for A. Are these two ships meeting end on or nearly end on? "Again: A. is a steamship steering due W.; B. is a steamship four degrees on A.'s "starboard bow and steering E. four degrees S. Are these two ships meeting end "on or nearly end on?—In my opinion in both cases the answer should be in the "affirmative, and both ships should port."

The Committee do not doubt that, speaking generally, it is the intention of the Regulations that the direction to port imposed on ships in a certain position by day should apply to ships in the same position by night. It is they think also beyond question desirable, were it practicable, that the Regulations should be so applied as to direct the course of a ship in every position of danger, but should not affect them when in positions free from risk of collision, still less convert positions of safety into positions of danger. But it would appear that in the case of vessels approaching each other end on, or nearly end on, this ideal is, in theory at least, unattainable for the reason that, as we have seen, the side-lights must cross somewhere ahead of the ship. If a screening as broad as four degrees be adopted, the cases in which vessels approaching each other on parallel and opposite courses but not each seeing both lights of the other, would, if they keep their courses, come into collision, are rare, but, with vessels of extreme breadth, they exist. On the other hand, with that screening, there are cases in which two vessels so approaching each other would see both lights of each other and yet, if they keep their courses, would pass clear. If a finer screening than four degrees be adopted the former class of cases—namely, those in which a strict keeping of the course would involve risk—becomes more numerous; but, on the other hand, the latter class—namely, those in which an alteration of the course introduces

* Question 4931.

risk—become, correspondingly, less numerous. These results are, in theory, inevitable so long as side lights cross in the line of the ship's path.

Again: dealing with the specific instances of vessels approaching each other above quoted, the matter resolves itself into this, that unless the position of "end on or nearly end on" be exactly defined, it is always possible to put cases of vessels approaching each other at certain angles, and to raise the question whether under such circumstances they should port. No doubt, if the answer be in the affirmative with regard to vessels so meeting at night, it is tantamount to saying the lights should be screened so that both should show at that angle; but in the absence of any authoritative guidance at what angle of bearing from each other vessels should port at night, the matter is carried no further. And as the breadth of vessels differs greatly, there remains the consideration that no such angle can be fixed without its being either in many cases more than is needful, or in some cases less than perfect safety may, in theory, be supposed to require.

Of the two dangers, that incident to broad screening of two ships which would, if they kept their courses pass clear of each other, being brought into a position of risk by porting, and that incident to fine screening of two ships approaching on opposite courses, and coming into dangerous proximity, the great majority of sailors appear to think the latter the less formidable. The Committee share that opinion. It seems to them hardly conceivable that two ships each seeing the green light of the other slightly on her starboard bow should advance on opposite courses so exactly as to bring their starboard sides into collision when a slight touch of the starboard helm of both or either would carry them clear. It is true that the Regulations do not prescribe the use of the starboard helm in such cases. But it is never to be forgotten, and the Regulations themselves prescribe (Arts. 23 and 24), that in obeying and construing them "due regard shall be had to all dangers of navigation," and that nothing in them "shall exonerate any ship . . from the consequences . . of "the neglect of any precaution which may be required by the ordinary practice "of seamen or by the special circumstances of the case." The Committee do not doubt that the ordinary practice of seamen would prescribe the use of the starboard helm when necessary to avert collision in the supposed case. On the other hand, the Committee think that reasonable apprehensions arise in the case of a screening of side lights as broad as four degrees. There is imposed on ships the obligation of crossing each other's bows, and this is a proceeding necessarily of extreme risk, especially when the vessels are at no great distance from each other and moving at a high rate of speed. Stress has also been laid by pilots and others on this risk in narrow waters, and it has been strongly urged that, in such situations especially, the speedier indication of a change of course afforded by finer screening is of great value. It may be that in the case of some rivers special regulations and the practice of local pilots go far to render the regulation of porting to both lights inapplicable or unnecessary. But there are many places in which ships in considerable numbers meet on opposite courses within limits practically narrow, and in such cases it appears to the Committee of importance, as it has appeared to almost every witness of practical experience called before them, that a vessel should not be compelled unnecessarily to cross the bows of another, with perhaps the result of thus bringing herself into a position in which the operation has to be repeated in regard to one or more successive vessels.

It was stated by several witnesses to the Committee, and no doubt is the fact, that vessels in steering their course always yaw to some, and often to a considerable, extent. Inasmuch as the practical effect of a ship's yawing is to show each light alternately at an increased distance across her course, and thus to magnify the angle of screening, whatever it be, it appears to the Committee that this consideration points to the superior advantage of a finer angle of screening.

The Committee desire to point out that the considerations in favour of the finer screening apply with increased force to the electric light as compared with that of the oil lamp.

The Committee found by their experiments* that with electric lights screened to four degrees from the outside of their filaments, at the distance of one mile (a critical distance in collision cases), the field in which both side-lights could be seen in their full strength was considerably wider with the electric lights than it was with oil lamps, and the field of visibility of the extreme rays was wider, though not to the same

* *See* Appendices 9 and 12.

extent, with the electric lights than with oil lamps. At a distance of two miles (a distance at which the full light of the lamps is of special importance) the field in which both electric side-lights could be seen in their full strength was considerably wider than with oil lamps, but the field of visibility of the extreme rays appeared about the same with oil and electric lights.* It is, indeed, conceded by the advocates of the broader screening that such results of the electric light might render finer screening in the case of that light desirable.† But the experiments of the Committee also showed that the method of screening recommended by the Committee hereafter does not involve wide variations of the fields of visibility of the two types of light. With such method of screening, therefore, the advantages of one rule for oil and electric lights can be retained.‡

The Committee have thought it desirable to enquire into the practice of screening side-lights pursued in the Royal Navy. They find that the practice has not been changed in consequence of the present Order in Council, and that it is not governed by any principle which can be considered as certain. The rule appears to be§ that the screening of the side-lights is so regulated that the full light is clearly seen at a distance of 200 yards in the case of large vessels, and 150 yards in the case of small vessels, on a projected line of the ship's keel. It is obvious that, as on board men-of-war the side-lights are necessarily placed at very different distances from each other, the angle of screening in various cases must be very different; but it would seem that the result is to give an angle of screening in many cases less than four degrees from the outside of the wick. The practice, therefore, of the Royal Navy, while it adds further authority to the opinion that the side-lights should cross somewhere ahead of the ship, offers no material assistance in determining with precision the best angle of screening. But the Committee had the advantage of learning the opinion of four officers of the Royal Navy of great experience in practical navigation, and though they had not come to any exact conclusion as to the best angle of screening, they concurred in thinking an angle of four degrees too broad.‖ To the opinion of these officers the Committee attach great value.

The Committee are impressed with the importance of uniformity existing in the practice of other nations with that of Great Britain. They do not desire to express a decided opinion, but they cannot regard it as free from doubt, whether a direction to screen to four degrees from the outside of the wick might not be regarded by foreign courts of Admiralty as a contravention of the International Regulations. But they do not anticipate that such a result could follow the introduction of a direction to screen on a fore-and-aft line to the inside of the wick; on the contrary, they know of nothing in the past or present practice of other nations to prevent such a direction from obtaining general acceptance. Before the present Order it would appear that the Instructions of the Board of Trade were reproduced by other foreign nations, and that thus the principle of lights crossing before the bow of the vessel may be considered to have been generally approved. But in some cases further directions were given. The Swedish Regulations¶ were a translation of the English Regulations, but with the following addition: "The rays from the side-lights may be considered to cross "each other at a proper distance ahead of the vessel, and both lights to be seen only "from right ahead, if an imaginary line, drawn from the inner edge of the wick, "parallel with the midship line of the vessel is a tangent to the outer edge corner of "the screen": words which not only lay down principles of screening from the inner edge of the wick, but seem to place on the Board of Trade Instructions before the present Order an interpretation amounting to a direction to that effect. In Denmark** a rule was adopted of screening so that the rays crossed at a distance of a cable's length in front of the bow, an effect secured, it would seem, in the opinion of the authorities of that country, by a screening to the inner side of the flame. The Committee do not think it necessary to refer at length to the views expressed by foreign governments as to the present Order, but they notice that it has met with decided opposition from those of Denmark and the Netherlands,†† and they see no

reason to doubt that a general agreement can be obtained on the basis of the screening they suggest more readily than on that directed by the present Order.

In view of the use, probably destined to increase, of electricity, the Committee thought it right to turn their attention to this mode of illuminating side-lights. The evidence before them appears to show that this mode of lighting is practically at least as regular and secure as that by mineral or vegetable oil. The Committee conducted some experiments with a view to ascertain whether a screening to the inner edge of the filament of an incandescent lamp produces similar results to those of screening to the inner edge of a wick, and they find that for practical purposes the effects may be considered as identical. But the Committee were impressed with the inferior appearance of the green light when equal candle power to that of the red light was employed, and it appears to them that, whether oil or electricity be used, a greater power should be employed in the green than in the red lamp. The Committee found that 16 candle power in the red, as against 32 candle power in the green, produces an excellent result. It further appears to the Committee that the masthead light should not be so powerful as to diminish the visibility of the side-lights. The Committee were also impressed with the importance of the best shade of green glass being employed, but they think further experiments directed to this point necessary to determine the exact shade which exhibits the most effective light. They think it desirable that the colour should be supplied by a separate glass placed within the lens.

The attention of the Committee was directed to the effect of a permanent list of a ship on the side lights. There is no doubt that, especially with particular cargoes, vessels do navigate with several degrees of list, and it was suggested that this, by altering the relative position of the flame in the lantern, would affect the amount of the rays thrown across the end of the screen. The Committee made some experiments on this point, with the result that they did not find the effect so marked as to necessitate any special rule on the subject.

In order that the screen should maintain a uniform position in relation to the wick, the Committee think it is of great importance that means should be taken to regulate the distance of the wick from the inboard face of the lantern. The Committee would suggest that to meet the cases of vessels of different sizes, several classes of standard lamps should be sanctioned, the distance of the inner edge of the wick from the inboard face of the lantern in each class of lamp being prescribed.

If side-lights are mounted in lighthouses, the Committee think that facilities should be provided by means of apertures in those structures for direct measurement from the wick to the centre of the ship, for the purpose of properly adjusting the screens.

The Committee have considered whether, in order to counteract the effect in widening the area within which the lights are seen ahead of wicks, or electric filaments, of unusual breadth, resort should be had to the discretion conferred by the terms of the Regulations of extending the length of the screen in such cases. But they are clearly of opinion that it would, for practical reasons, be highly undesirable to render it necessary to alter the length of the screen to suit different lamps. The same result can be obtained by dealing with the breadth of the wicks or filaments, and, in their judgment, all difficulty will be sufficiently met by directing that no wicks, or filaments (treating the breadth of filaments as that between the extreme edges of their curves), shall exceed two inches in breadth. It is probably not necessary to prescribe a minimum in the case of wicks, but the Committee consider that neither wicks nor filaments should be less than one inch or more than two inches in breadth when measured at right angles to the fore-and-aft line of the ship.

If the screens be placed as the Committee suggest, there is, of course, no objection to the lens embracing an angle of 120 degrees, as recommended by the Instructions of the Board of Trade,* the limitation of the full power of the light to two points abaft the beam being maintained by a proper construction of the lantern. We have no doubt that there are practical advantages in the lens being of this size.

Several members of the Committee have visited some of the principal ports of the kingdom in order to ascertain by personal observation the actual condition of lamps and their screening. The reports of these gentlemen will be found in the Appendix.† The Committee have arrived at the conclusion that the fixing and fitting of the screens, and the lights, both permanent and spare, require much more careful supervision than they have hitherto received.

* *See* App. 2, No. 1. † *See* App. No. 20.

The Committee desire to express their acknowledgments to the officers of the Board of Trade for the very able and candid manner in which they placed their information and opinions at the service of the Committee.

In conducting their experiments at Shoeburyness the Committee derived invaluable assistance from the Commandant, from Major Elmslie, and from the other officers of the Royal Artillery. They are also greatly indebted for the assistance rendered by Mr. Peter Samson of the Board of Trade. The experiments directed by the Committee were not intended to be exhaustive, but were selected in order to verify certain special points, and to form a basis of calculations. They were conducted with great care, and the Committee believe that the facts stated in the two reports in the Appendix may be taken as correct.

The Committee desire to express their obligations to their Secretary, Mr. Hipwood, of the Board of Trade. His acquaintance with the subject as well as his ability has been of the greatest service to them.

Our colleague, Captain Thomson, was rendered unable, by absence on service in the Mediterranean, to be present at the later meetings of the Committee, and at the experiments conducted by us. He has authorised us to append his name to the Report subject to any Memorandum he may desire to subjoin.*

In conclusion the Committee make the following recommendations, which are limited to the matters directly involved in the questions submitted to them :—

1. That the Order in Council of January 30th, 1893, be cancelled.

2. That in the case of oil lamps the forward edge of the screen, or chock on it, should be in a line parallel to the keel with the inside edge of the wick.

3. That in the case of electric lights there should be a similar screening in regard to the inside edge of the filament.

4. That the breadth of the wick or system of wicks of each oil lamp, and of the filaments in the case of the electric light, should be not more than two inches nor less than one inch, measured at right angles to the fore-and-aft line of the ship.

5. That the visibility of the green light should as nearly as possible be equalized to that of the red, by the employment of higher candle-power; and that the masthead light should not be so powerful as to diminish the visibility of the side-lights.

We have the honour to be,

Sir,

Your obedient servants,

# MINUTES OF EVIDENCE.

## Wednesday, 27th March 1895.

PRESENT:

THE RIGHT HON. SIR FRANCIS H. JEUNE IN THE CHAIR.

Rear-Admiral ANDOE.
Captain WILSON BARKER.
Mr. BOLAM.
Captain CASTLE.
Sir FRANCIS EVANS.
Sir EDWARD HARLAND.
Captain HALLETT.
Mr. THOMAS H. ISMAY.
Mr. SCRUTTON.
Captain THOMSON.

Mr. C. HIPWOOD, *Secretary*.

Mr. WALTER J. HOWELL called and examined.

*Mr. W. J. Howell.*
27 Mar. 1895.

1. (*Chairman.*) I think you are the principal clerk in the Marine Department of the Board of Trade?—Yes.

2. Will you kindly tell the Committee what is the nature and extent of your experience at the Board of Trade?—My experience at the Board of Trade has extended over a period of 20 years, almost entirely in the Marine Department. But I also served as private secretary to Sir Henry Calcraft when Permanent Secretary to the Board of Trade, and to Sir Michael Hicks-Beach when President.

3. Are you the officer in charge of the Marine Department?—No. Mr. Ingram Walker is the Assistant Secretary in charge of the Marine Department, but I regret to say he has met with an accident and is unable to appear before the Committee to-day. I am here in his place, to give every information in my power on his behalf to the Committee.

4. Will you tell the Committee what are the duties of the Marine Department with regard to ships' side lights?—To see that the regulations made by Order in Council under the provisions of the Merchant Shipping Act, are complied with, and to prosecute, wherever practicable, in cases of infringement.

5. In what way do the Board of Trade secure compliance with the regulations respecting side lights?—By instructions to their Surveyors, which will be put in, and explained to the Committee by Sir Digby Murray, the professional officer of the Marine Department, and by other members of the technical staff.

6. Can you give the Committee any information with regard to the steps which have led up to the adoption of the present system of side lights?—The want of a uniform system of night signals for steamships was commented upon in the Reports of a Select Committee of the House of Commons on Steam Navigation in 1831,* and of a Royal Commission on Pilotage in 1836;† but the adoption of side lights, so far as I have been able to ascertain, was not suggested until 1839.‡ In that year the Board of Trade instituted an inquiry into: "1. The number and nature of the "accidents which have happened in steam vessels "within the last ten years as far as they can be "ascertained; 2. The practical means of preventing "the recurrence of accidents." The result of this inquiry was a report, stating that almost every imaginable variety of light was in use on steam vessels, and that collisions commonly arose from the absence of an universal understanding as to the "rule of the road" to be observed by vessels, in meeting and passing each other, and from the absence of an universal system of night lights or signals.

7. Was there any definite recommendation on the subject of side lights made in the report to which you are referring?—Yes. I will read an extract from the report dealing with the matter:—"In order to diminish "the frequency and danger of collisions, and being "convinced of the necessity for establishing a de- "finite 'rule of the road,' and an uniform system of "signals, for the government of steam vessels, we "should have introduced into the foregoing outline "distinct provisions on the subject, had it not been "that a measure of this kind has been advised in "the report of the 'Commissioners appointed to in- "'quire into the Laws and Regulations relating to the "'Pilotage of the United Kingdom,' to be incor- "porated in a new pilot Act. Referring, however, "to the tenor of our instructions as to 'the nature of "'the accidents in steam vessels,' and to 'the means "'of preventing them,' and on a review of the valu- "able information supplied to us on this head, we "cannot avoid recommending the adoption of a "system which has for so many years been found "practically efficient, against which no objections have "hitherto been urged, and which has met the con- "currence of so numerous a body of steam navigators. "The system we advise is:—1. As to the 'rule of "'the road.' That steam vessels approaching and "passing each other should *starboard* their helms, "with the view of keeping on the starboard side of "each other, respectively as far as practicable. 2. As "to night signals. The want of an uniform and "sufficient system of lights has been so fruitful a "source of collision and injury that we recommend a "system similar to that now practised by a numerous "class of commanders of private steamers, and which "has been substantively approved of and adopted by the "commanders of Her Majesty's steam packets at Liver- "pool, viz., that in all *sea-going* steam vessels there be "a *white* light at the foremast head, visible in clear "weather from 8 to 10 miles; a *white* light attached "to the forepart of the *starboard* paddle-box which "can be seen six miles in clear weather, and a third "light which is *red* attached to the fore part of the "*larboard* paddle-box visible about three miles. The

*Mr. W. J. Howell.*

27 Mar. 1895.

" three lights can only be seen at one and the same " time when right ahead, or nearly so; in any other " position before the beam two only are visible, and " their colours define the position of the vessel. " 3. That the obligation to carry some powerful " steam-whistle, bell, or gong, be part of the proposed " law as regards steam vessels; also that their rate " through the water be defined during fog and thick " weather, in crowded waters, whether plying by day " or night. It is also obvious that some regulations " are essential to determine the nature, and enforce " the carrying of lights in river steamers, sailing " vessels, and vessels at anchor."

8. (*Sir E. Harland.*) What is the date of that?—1839.

9. (*Sir E. Harland.*) Then the starboard light was at that time white, not green?—Yes.

10. Did any legislation on the subject follow immediately?—Apparently not. The next step appears to have been the passing of an Act in 1846,* to regulate steam navigation. Section 10 of that Act empowered the Admiralty to make regulations for the exhibition of lights by steam vessels; and I have here an Admiralty paper of 1847 dealing with the exhibition of lights.†

11. (*Chairman.*) This refers to the first exercise by the Admiralty of their statutory power?—I believe so.

12. (*Sir E. Harland.*) Is it mentioned when the green light was first used?—The starboard light referred to in the paper of 1847 is a green light.

13. (*Chairman.*) What paper are you reading now?—The paper I have just referred to is an Admiralty paper which was issued in 1847, after the passing of the Act of 1846. I think I had better read the whole of it. It is dated December 13th, 1847:—" The " great increase in the number of steamers, and the " want of an adequate and uniform plan of lights, has " of late years occasioned an infinity of accidents from " vessels running foul of each other in the night, " involving, not only a serious destruction of valuable " property, but also a melancholy loss of human life, " and without the most diligent and attentive con- " sideration, as to the best plan to be adopted to " obviate such disasters, the evil is likely to increase. " To nautical men it will readily appear that the " generality of the accidents alluded to, is attributable " to the want of means to ascertain promptly the " direction in which a vessel may be steering, at " the moment she is first discovered, at night; for " when a ship's light is first perceived in a dark " night, the observer is merely informed that there is " a vessel in the direction of that light, but he is still " ignorant of the course she may be steering. He " has no means of ascertaining immediately (what is " all important at this critical moment) whether the " strange sail may be steering directly towards him, " or whether she may be standing in some direction " across the bows either to starboard or to port. In " this doubt, the helm is frequently put the wrong " way, and a collision is the consequence; but another, " and perhaps the first and most important point to " determine is, whether the light when seen, is that of " a steamer, and if so, whether she is under weigh. " Here, then, is a palpable defect in every mode of " night signals hitherto adopted—the evident source " of frequent damage and loss of life. To remedy " this deficiency, nothing more would appear to " be required than that the same light which " announces the approach of a vessel in the dark, " should not only indicate that it is a steamer, and " under weigh, but should also point out the direction " of her head. With a view to supply this great " desideratum, the following is the plan intended to " be generally adopted." I put in the diagrams ‡ issued with this paper of 1847, which show that the plan to be adopted consisted of a white light at the foremast head, with a green light on the starboard bow, and a red light on the port bow. The paper goes on to say:—" The manner of fixing the coloured " lights should be particularly attended to. They " would require to be fitted, each, with a screen of " wood or canvas on the inboard side, in order to " prevent both being seen at the same moment from " any direction but that of right ahead. This is " important, for without the screens (a principle first " introduced with this plan) any plan of bow lights " would be ineffective as a means of indicating the " direction of steering."

14. (*Chairman.*) Then what was the next step?—In July 1848 the Admiralty, under the powers conferred upon them by the Act of 1846,* to which I have just referred, issued an order laying down what lights should be carried by steamers in order to prevent collision. This order was published in the London Gazette of July 11th, 1848. Omitting the preamble, the order is as follows: " We hereby require, in " pursuance of the said Act, that lights shall be " exhibited by all steam vessels, except in the River " Thames above Yantlett Creek, between sunset and " sunrise, of such description and in such manner as " herein-after mentioned, that is to say:—When under " weigh: 1. Bright white light at the foremast head. " 2. Green light on the starboard side. 3. Red light " on the port side. When at anchor a common bright " light. The following conditions to be observed, viz.: " 1. The masthead light to be visible at a distance " of at least five miles in a clear dark night, and the " lantern to be so constructed as to show a uniform " and unbroken light over an arc of the horizon of 20 " points of the compass, viz., from right ahead to two " points abaft the beam on each side of the ship. " 2. The coloured side lights to be visible at a " distance of at least two miles in a clear dark night, " and the lanterns to be so constructed as to show a " uniform and unbroken light over an arc of the " horizon of 10 points of the compass, viz., from right " ahead to two points abaft the beam, on their " respective sides. 3. The side lights to be moreover " fitted with inboard screens, of at least three feet " long, to prevent them from being seen across the " bow. The screens to be placed in a fore and aft " line with the inner edge of the side lights. 4. The " lantern used when at anchor to be so constructed as " to show a good light all round the horizon."

15. Then what was the next enactment?—The Consolidation Act of 1851† provided that the Admiralty " shall from time to time make regulations requiring " the exhibition of such lights, by such classes of " vessels, whether steam or sailing vessels, within " such places and under such circumstances as they " think fit, and may from time to time revoke, alter, " or vary the same . . " The regulations issued by the Admiralty under this Act on the 1st May 1852 do not differ materially from those issued in 1848. The requirements as to steam vessels' lights are as follows: " All British sea-going steam vessels (whether " propelled by paddles or screws) shall within all seas, " gulfs, channels, straits, bays, creeks, roads, road- " steads, harbours, havens, ports, and rivers, and " under all circumstances, between sunset and sunrise, " exhibit lights of such description, and in such " manner, as herein-after mentioned, viz.:—*When* " *under steam.* A bright white light at the foremast " head; a green light on the starboard side; a red " light on the port side. 1. The mast head light is " to be visible at a distance of at least five miles in a " dark night, with a clear atmosphere, and the lantern " is to be so constructed as to show a uniform and un- " broken light over an arc of the horizon of 20 points " of the compass, being 10 points on each side of the " ship, viz., from right ahead to two points abaft " the beam on either side. 2. The green light on the " starboard side is to be visible at a distance of at " least two miles in a dark night, with a clear atmos- " phere; and the lantern is to be so constructed as to " show a uniform and unbroken light over an arc of " the horizon of 10 points of the compass, viz., from

* 9 & 10 Vict. c. 100. † H.C. 696 of 1851, pp. 31 and 32.
‡ *See* Appendix 1, No. 1.

* 9 & 10 Vict. c. 100. † 14 & 15 Vict. c. 79. s. 26.

" right ahead to two points abaft the beam on the " starboard side. 3. The red light on the port side " is likewise to be fitted so as to throw its light the " same distance on that side. 4. The side lights are " moreover to be fitted with screens, on the inboard " side, of at least three feet long, to prevent the lights " from being seen across the bow."

16. What was the next statutory provision with regard to ships' lights?—The provisions empowering the Admiralty to make regulations as to lights were re-enacted in section 295 of the Merchant Shipping Act of 1854, and revised regulations were issued by the Admiralty and published in the London Gazette of 5th March 1858.

17. Do these regulations of 1858 differ materially from the regulations of 1852 so far as the side lights of steam vessels are concerned?—No, but the rule as to the fitting of the screen is worded differently. The regulations of 1858 provide: " 4. The side lights are " to be fitted with inboard screens projecting at least " 3 feet forward from the light, so as to prevent the " lights from being seen across the bow."

18. The provisions of the Act of 1854 were repealed, were they not, by a subsequent Merchant Shipping Act?—Yes, the section to which I have referred was repealed by the Merchant Shipping Act, 1862. Section 25 of this Act provided a set of regulations which became, by section 27, binding on owners and masters of ships. The regulations contained in the schedule to this Act of 1862 are practically identical, so far as screening is concerned, with those issued by the Admiralty in 1858. Section 25 of the same Act conferred power upon Her Majesty (on the recommendation of the Admiralty and the Board of Trade) by Order in Council to alter or add to such regulations, and this power has been frequently exercised.

19. That was the first time, was it not, that the Board of Trade was brought into play with regard to that matter?—Yes.

20. Up to that time the duty had been entrusted to the Admiralty and the regulations were framed by the Admiralty?—Quite so.

21. Has any alteration been made in the Regulations for Preventing Collisions at Sea, so far as screening is concerned, since 1862?—None whatever until the issue of the Order in Council of the 30th January 1893, which Sir Digby Murray will put in and explain.

22. The Board of Trade have no doubt issued definite instructions to their surveyors from time to time with regard to screening ships' lights?—Yes. In March 1868, the attention of the Marine Department was called to the want of uniformity that existed on the subject, and they consulted with the Admiralty and the Trinity House. The correspondence was printed in a House of Commons Return, No. 114 of 1869. The result was the issue of instructions by the Board of Trade to their surveyors in September 1868.*

23. It was one of the surveyors who called the attention of the Marine Department to the subject?—Yes.

24. The correspondence took place between the Board of Trade and the Admiralty and Trinity House?—Yes.

25. (*Chairman.*) Have you the Board of Trade letter to the Trinity House?—Yes.

26. (*Chairman.*) There is a passage in the conclusion of Mr. Thomas Gray's letter which I think the Committee would like to hear as it really gives a summary of the whole?—Yes. The passage is as follows:—" The real points appear to be: first, to " insure that the red and green rays do not cross each " other immediately on leaving the ship, nor at all, " more than is possible. Secondly. To insure that " the distance ahead, within which neither light is " seen, is not greater than can be avoided. The " Board of Trade will be obliged if the Elder Brethren " of the Trinity House will favour them with their " observations and advice on the points raised."

* See Appendix 1, No. 2.

27. (*Mr. T. Scrutton.*) May we know how that question first arose?—It was raised by one of the Board of Trade surveyors, Mr. Macfarlane Gray.

28. Is the paper to be handed in?—Yes.

29. (*Mr. Ismay.*) If I remember rightly it was in a letter from Mr. Macfarlane Gray, who found that the lights were not uniformly screened?—That was so.

30. (*Chairman.*) Here is the whole thing in this return to the House of Commons.* We have here the whole correspondence, and I am sure that the Committee would like to see certain parts of it. Perhaps you will read Mr. Macfarlane Gray's letter, because that really was a summary of what was passing through the mind of a Board of Trade surveyor at that time?—The letter is dated 13th March 1868, and is as follows:—" In discharging my duties as Inspector " of Lights, I find that there is not that uniformity in " the practice of your surveyors which I believe you " expect; and although I have had some confidence " in carrying out the instructions as I have under- " stood them, that confidence is now changed into " uncertainty, and I have, therefore, to ask for " definite instructions upon the following points:— " 1st question. Regulations for preventing collisions " at sea, &c. Articles 3 (*b*) and (*c*), 'So fixed as to " 'throw the light from right ahead to two points " 'abaft the beam.' (*d*) 'Screens so as to prevent " 'these lights from being seen across the bow.' " These two clauses give different measures for the " angles of light, and I find every variety of it from " Fig. No. 1 to Fig. No. 2, if not even a wider " range."

31. The regulations Mr. Macfarlane Gray had before him were those contained in the Act of 1862, but they were practically identical with the Admiralty regulations we have heard just now?—Yes. And these regulations, so far as they affect screening, have not been altered by one word since they were first published in the Act of 1862. The letter goes on:— " Mr. Gray's Mnemonic Rhymes say:—

> " When both side lights you see ahead,
> " Port your helm and show your red.

" Now with lights as in Fig. 1 the vessel may " have run into you, and still the three lights are " seen. Fig. No. 1 is the general arrangement. " With lights as in Fig. No. 2, which I think is right, " so long as you see three lights there is a chance of " steering clear. The Holyhead mail boats are as " Fig. 2; I found them so, and I have altered several " vessels to that, but I find the 'Leda,' surveyed in " London, is as Fig. No. 1, and I have therefore " stopped altering any more until I have further " instructions. According to the present instructions, " a vessel may not show three lights in any position, " for right ahead at the two sides are parallels which " would never meet. Between that and converging " at the bowsprit is, I think, a wider range than was " intended; and I can conceive several inconveniences " with lights as in Fig. 1, if lights as in Fig. 2 " are also permitted. 1st. Let a steamer A., as Fig. 1, " meet a steamer B., as Fig. 2. A. sees B., a green " light right ahead; A. starboards, and brings the " green light on his starboard bow, and the vessels " approach each other; A. has not shut his red to B., " only shaped a clear course. B. for the first time " sees A., now half point on his starboard bow, and if " he did nothing he would be safe, but he sees three " lights meeting him only half a point to starboard; " to him in a dark night, seeing no vessel but only " the lights, there is evidently risk of collision; he " ports and thereby fouls the other vessel. Here A.'s " arc of three lights is so broad that it exceeds the " angle which the captain thinks sufficient to clear " the other vessel. This can never happen in a " channel unless against rules. Here the error is " increased by each captain supposing the other " vessel's lights to be the same as his own. 2nd. " With lights, as in Fig. 1, 'passing vessels' would

* H.C. 114 of 1869.

*Mr. W. J. Howell.*

27 Mar. 1895.

" often be mistaken for meeting vessels,' and although " they would have cleared each other, 'green-to- " green,' they would be brought out of their safe " courses into positions of greater danger, crossing " each other's bows to bring 'red to red.' Here we " have both danger and inconvenience, and un- " necessary interference with the courses of the " vessels. 3rd. With lights, as in Fig. 1, the arc " of three lights is an arc of doubt, and a captain " watching the other lights to see on which side he " is, is kept too long in suspense, not as to what he " should do, but as to whether the other vessel is " doing what they should do. With lights, as in " Fig. 2, there is but an instant between red or green, " and the whole of the time is available for steering " clear of each other. If within the black triangle it " does not matter where they put the helm. I have " no right to give an opinion on this subject. I have " believed Fig. 2 to be right, that is to make the " lights converge to an angle not more than half a " point, that is, the length of the triangle to be 10 " times the base, and I have given the above reasons " for my having done so; if I am in error I will get " the vessels altered at once."

32. (*Sir E. Harland.*) This is still Mr. Macfarlane Gray's answer to his own question?—No, that is the first question.

33. He first put a question and now he has been answering it?—He says what he thinks is right.

34. (*Chairman.*) Mr. Macfarlane Gray evidently thought the alternatives were between crossing actually at the bow and crossing at a certain distance which he puts, I think at 10 times the distance between the lights themselves; these he seems to consider the only two alternatives, and evidently he was perplexed between them. Then Mr. Thomas Gray on that wrote to the Trinity House, and we have had the way he put it, that the real points appear to be, first, to insure that the red and green rays do not cross each other immediately on leaving the ship, nor at all more than is possible; and secondly, to insure that the distance ahead within which neither light is seen is not greater than can be avoided. It is not very easy to reconcile the two points; in fact, some people would say they were directly contradictory. Now for the Trinity House answer?—On the 8th April 1868, the Trinity House wrote acknowledging the Board of Trade's letter, and saying—" In reply " thereto I am to state that it appears to the Elder " Brethren that without going into all the surveyor's " details, which are somewhat confusing, the question " is a practical rather than a theoretical one. On the " first point raised I am to state that it appears to " the Elder Brethren that it would be manifestly " impossible to fix upon any spot where the rays of " the side lights should or should not meet, and that " although the breadth of the ship would intervene if " the rays were carried ahead with mathematical " precision (an operation which it is difficult with " even the most accurate optical apparatus to carry " out), such precision could not be attained, even " with the proper 3-feet screens, in such lights as " are in general use; and that, as therefore there is a " dispersion of light which does cover the intervening " space of the breadth of the ship, practically the " three lights are seen together. I am to add that it " must be also remembered that the lights are not " seen from a point, but from a vessel of like condi- " tions, and when the observer is master of a like " space; and that the Elder Brethren are therefore of " opinion that the lights to be placed in accordance " with the regulations, should throw their central ray " on a line parallel with the keel and with the inboard " screen." The rest of the letter deals with the mast head light.

35. I do not think that up to this time there had been any order issued prescribing the use of a screen with regard to either edge of the wick?—I think not.

36. (*Sir Edward Harland.*) You have already given us the Admiralty regulation with regard to the screen being on the inner side of the lamp?—Yes, the regulation was at this time contained in the schedule to the Act of 1862.

37. (*Chairman.*) Now will you take next the instructions which the Board of Trade issued in consequence?—The result of the correspondence was that the Board of Trade issued definite instructions to their surveyors; and these instructions are dated September 1868, and are printed in the parliamentary paper from which I have been reading.* Sir Digby Murray will deal in detail with the instructions; but I should like to call the attention of the Committee to the following passage, which seems to me to have an important bearing upon the question at issue:—" If the " surveyor finds that the red and green rays cross " each other, he should of course have the defect " remedied at once. There are many ways of doing " this; for example, the screen may be lengthened; or " another board may be placed outside it (Fig. 4); or " a chock (equal in thickness to the distance between " the inner edge of the lens and the side of the " screen) may be secured to the fore end of the screen " (Fig. 5); or the lamp may be so placed that the " outside of the screen will come against the inner " edge of the lens (Fig. 6); or the screens may be " so placed that the distance across the ship between " their outer sides, at the fore end, shall be equal " to the distance between the inner edges of the " lenses of the two lamps (Fig. 7). If the red and " green rays cross each other immediately on passing " the stem, the red light will be seen on the starboard " bow, and the green light on the port bow, as shown " in Fig. 8; but, on the other hand, if they do not " cross, at least to a slight extent, then they cannot " both be seen ahead. The real points to be studied " in fixing and arranging the inboard screen appear " to be:—First, to insure that the rays of the red and " green side lights do not cross each other immediately " on leaving the ship, nor at all more than is possible; " and secondly, to ensure that the distance ahead " within which neither light is seen is not greater than " can be avoided."

38. Have any further instructions been issued to the Board of Trade Surveyors?—Yes, from time to time, and these Sir Digby Murray will put in and explain. I should, however, wish to say at once that the 4° angle of screening was first definitely laid down by an instruction in 1892. The reasons for the issue of this instruction will also be explained by Sir Digby Murray and other technical members of the staff of the Department.

39. The 4° rule excited considerable opposition, did it not?—Yes, and that opposition has been continued to the present time, and has, in fact, led to the appointment of this Committee. The Order in Council of the 30th January 1893, to which I have already referred, was obtained for the purpose of setting at rest questions which had been raised by shipowners as to the binding nature of the Board's regulations.

40. Have you any other papers to lay before the Committee on the legal aspect of the question?—Yes, with your permission I will put in the following papers:—1. Case laid by the Liverpool Steam Shipowners' Association before Sir Walter Phillimore and Mr. Joseph Walton, Q.C., with their opinions thereon; and 2. Case laid by the Board of Trade before the Law Officers of the Crown, (Sir Charles Russell, and Sir John Rigby) with Sir Richard Webster, Mr. F. W. Raikes, Q.C., and Mr. Sutton, with their opinions thereon.†

(*Mr. Ismay.*) What are the dates of those?

(*Chairman.*) Sir Walter Phillimore's is April 22nd, 1893, and the Law Officers' the 12th August 1893.

(*Mr. Ismay.*) The opinion of the Law Officers followed the other opinion?

(*Chairman.*) Yes.

* H.C. 114 of 1869.

† *See* Appendix 1, No. 3.

*Mr. W. J. Howell.*

27 Mar. 1895.

41. Has not the subject of screening ships' lights been dealt with by a previous Departmental Committee?—It has. That Committee consisted of the following gentlemen:—Sir Charles Hall, as Chairman; Sir Courtenay Boyle; Captain W. C. Angove, of the Peninsular and Oriental Steam Navigation Company; Captain Holland, R.N.; Admiral Sir Robert Molyneux; Sir Digby Murray; Sir George Nares, of the Board of Trade; Mr. William Watson, of the City of Dublin Steam Packet Company; Captain C. G. Weller, of the Trinity House; and Captain Wharton, R.N., Hydrographer to the Admiralty. It reported in December 1893, and I will put in a copy of the report.*

42. (*Sir E. Harland.*) Has the opinion of the Law Officers been given?—I put that in.

43. (*Mr. Scrutton.*) Is the schedule to the Order in Council of January 1893 the work of a committee, or the work of an individual?—I think it was drafted at the Board of Trade after consultation with eminent lawyers and with the professional officers.

Sir DIGBY MURRAY called and examined.

*Sir Digby Murray.*

44. (*Chairman.*) I need hardly ask you your qualifications and position. Perhaps you will shortly say what they are?—I am professional member of the Marine Department of the Board of Trade, and have been employed there since January 1873.

45. There is a matter to which you think it desirable to call attention before going into the more immediate question connected with these side lights, and that is as to the condition of the law as regards the statutory power, or the absence of the statutory power of the Board of Trade with reference to side lights?—I think it has a bearing upon the subject.

46. The Board of Trade, I think, have no power to insist on anything connected with the lanterns, except that they shall be of such a character and so fitted as to comply with the International Regulations?—That is so.

47. Then they have no power, for example, have they, to insist upon the character of the lamp, the description of the lens, the vertical divergence above or below the horizontal plane, or the position of the wick inside the lantern. All those are matters they have no power to prescribe?—They are really only recommendations on the part of the Board of Trade. They have no power to insist upon them.

48. In fact, their one power is to interfere when the side lights do not show in the manner, or at the distance, required by the Regulations?—Yes, but the defects must be obvious. Otherwise the Board of Trade Surveyor would have very great difficulty in proving them

49. Of course, it could only be done by experiment?—Yes, and that would be impracticable except in a few isolated cases.

50. I think the matter has engaged the attention of the German Lloyd, has it not?—Yes.

51. And they have commented upon the numerous patterns of the side lights?—That is so.

52. Has the divergence of character in the nature of the lights had any effect on the question of screening to any required angle?—Yes, it has every bearing upon it. You take one pair of side lights and screen them to any angle you may think proper. If one of those lights is broken or shifted, or replaced by another set of lights, the angle of screening would be quite different.

53. I suppose it may be even taken that a vessel often ships a second set of lights of somewhat different character to the others?—Yes, and in some cases which have come under observation, as many as three pairs of lights have been on board a ship, all of them screened to different angles.

54. I think the Board of Trade have always, had two things before their minds, have they not? First, that the Regulations as to side lights appear to require the full volume of light to be seen ahead; and also that both side lights shall be visible when two vessels are meeting end on, or nearly end on?—That has always been the Board of Trade interpretation of the Regulations.

55. I think when we come to go into the diagrams and experiments we shall be able to look a little more closely into the questions which bear upon those two views as to what is requisite. Now, will you kindly state to the Committee what were the suggestions of the Board of Trade to surveyors as to the screening of side lights from 1868 up to the issue of the new rules in 1892?—The suggestions and accompanying diagrams were to the effect that a line drawn parallel to the keel from the inner edge of the lens would indicate the depth of chock necessary to cause the light to cross suitably.

56. Could you tell me when was the first suggestion or instruction by the Board of Trade, which referred to a line being drawn with relation to the inner edge of the lens or wick?—In 1868.† The diagrams issued with the Instructions of 1868 were never altered up to 1892.

57. You have been kind enough to place in my hands a circular sent to surveyors by the Board of Trade in September 1868?—Yes.

58. I observe that they are issued after consultation with the Admiralty, and with the Elder Brethren of the Trinity House. The last witness has been good enough to give us the correspondence that had passed?—That is so.

59. I observe that the first matter one should notice is this:—"Seventhly.‡ The regulations require "that the coloured side lights shall be fitted with "inboard screens projecting *at least* 3 *feet forward from the lights.* Care must be taken that "the screens are 3 feet long, or such greater "length as the position of the light with regard to the "screen and its distance from the head of the vessel "may render necessary. The surveyor would do "well to observe the effect of alterations in the "distance of a side light from its inboard screen. "He should also bear in mind that if the lantern is "placed at a few inches outside an ordinary straight "screen of 3 feet in length, or even against such "a screen, the rays of light will be found to cross "the end of the screen so as to be visible to a vessel "approaching upon the opposite bow." (*See* Fig. 3.) "If the surveyor finds that the red and green rays "cross each other, he should, of course have the "defect remedied at once. There are many ways of "doing this. For example: the screen may be "lengthened; or another board may be placed outside it (Fig. 4); or a chock (equal in thickness "to the distance between the inner edge of the lens "and the side of the screen) may be secured to the "fore end of the screen (Fig. 5); or the lamp may "be so placed that the outside of the screen will "come against the inner edge of the lens (Fig. "6); or the screens may be so placed that the "distance across the ship between their outer sides "at the fore end shall be equal to the distance "between the inner edges of the lenses of the two "lamps" (Fig. 7)?—That last is the same thing, only in other words.

60. "If the red and green rays cross each other "immediately on passing the stem, the red light will "be seen on the starboard bow and the green light "on the port bow, as shown in Fig. 8; but, on "the other hand, if they do not cross, at least to a "slight extent, then they cannot both be seen ahead. "The real points to be studied, in fixing and arranging "the inboard screen appear to be: first, to ensure that "the rays of the red and green side lights do not cross "each other immediately on leaving the ship, nor at all

* *See* Appendix 1, No. 4.
† *See* Appendix 1, No. 2.
‡ H.C. 114 of 1869, p. 12. *See* Appendix 1, No. 2.

*Sir Digby Murray.*

27 Mar. 1895.

"more than is possible; and secondly, to ensure that "the distance ahead within which neither light is "seen is not greater than can be avoided." Now that expresses the principle which from first to last has been before the mind of the Board of Trade?—Yes. The diagrams which illustrate the matter were never altered until 1892; they were then altered on my recommendation.

61. I think you were going to explain that there had been some mistake made in 1879 with regard to a confusion between the word "wick" and the word "lens"?—Yes, and I would ask you to alter it to 1875. I may say that these instructions are out of print, and it has been difficult for me to get copies of them, and when I asked for all the previous instructions they were sent to me without the re-issue in 1875, and I find that that mistake occurred in the first place in 1875. I presume I need not allude to the instructions of 1872, which are identical with those of 1868.

62. Were these instructions of 1868 repeated in subsequent years?—Yes, in 1872 they were, and they have practically been repeated up to 1892, with the exception of the error to which I am about to call your attention. You will observe in the first place that this paragraph in the Instructions of 1875, to which I call your attention, is perfectly correct.

63. I will read it, with the Committee's permission:—"Or a chock equal in thickness to the "distance between the inner edge of the lens and "the side of the screen may be secured to the "fore end of the screen, or the lamp may be so "placed that the outside of the screen will come "against the inner edge of the lens"; so that the word in both cases is "lens"?—But in the next paragraph you will see the word "wick" has been substituted for the word "lens."

64. Later on in these same Instructions of 1875 occurs this passage: "For both lights to be seen ahead it is "necessary that the red and green rays should cross at "a certain distance ahead. Surveyors will probably find "that if the inboard edge of the *wick* touches a line "parallel with the keel of the ship, and that cuts "the outer edge of the forward end of the inboard "screen, the rays will cross suitably." Then was that a mere misprint?—It was entirely a misprint, as is shown not only by the former passage, but also by the drawings, which are exactly the same as they were before. It is a misprint for the word "lens."

65. The intention was that it should be the edge of the lens that should regulate the depth of the chock and not the edge of the wick?—Yes; if it was regulated from the inner edge of the wick, the screening would be remarkably fine; in the case of a 1-inch wick, placed at right angles to the ship's keel, it would give an angle of 1° 35′, but if the wick was placed parallel with the chord of the arc, which is of the two more frequently the case, the angle would be 1° 16′.

66. Then when was the error corrected?—It was not corrected until 1887. It never came under the notice of anybody. The clerk who ought to have read it and compared it seems to have overlooked it.

67. The view the Board of Trade took was that this was a mistake, and they acted upon it by remedying it, as I understand, in 1887?—Yes. I may say that the Board of Trade Surveyors have always construed it as if it were the inner edge of the *lens*, not the edge of the *wick*. In the Instructions of 1887 you may see that the line drawn from the inner edge of the lens to the outer edge of the chock is called the line of reference. In the Instructions of 1891, which were the next, this line is printed in the same way as the line of reference.

68. And I see in both cases the line of reference is a line from the edge of the chock to the edge of the lens?—From the inner edge of the lens to the chock.

69. So that those diagrams clearly show that the inner edge of the lens is intended and not the inner edge of the wick?—Yes, and you will see that the earliest diagrams—those of 1868—were never altered until 1892.

70. Were the same instructions worked upon both in 1887 and again in 1891?—Yes.

71. Were those instructions the instructions in force up to the recent alteration in them which is really now in question?—Yes, until 1892.

72. Perhaps you will kindly read to the Committee the instructions of the Board of Trade which are now in force?—"Side lights are always to be "screened to an angle of 4°, and are to be fitted "as follows, excepting when in turrets, in which case "it may be thought desirable so to arrange the "screens as to dispense with chocks, *see* Plate 1. "When the screens are fitted as in Figs. 3 and 4, "Plate 2, the outer wall of the screen is to be con-"sidered as the chock."* And then there is a drawing which shows exactly how they are to be screened.

73. Can you state to what angle the lights would be screened from the outer edge of the wick if the suggestions contained in the *old* Instructions had been complied with by the surveyors?—The mean in the case of lamps of the patterns in use prior to 1892 would be 4° 30′.† I put in a list of a number of measurements which were taken. The measurements were made by myself, and perhaps it would be convenient to you, either now or presently, for me to show how those measurements were made. There is a diagram here which shows it.

74. I think it would be convenient at the present moment. (*A diagram was produced*)?—The measurements in each case were taken from the inner side of the lantern to the outer edge of the wick. Subsequently to that the measurement was taken from the inner side of the lantern to the inner edge of the lens. Then this latter measurement was deducted from the larger measurement, and the difference was of course the tangent of the angle.

75. (*Sir F. Evans.*) The tangent of the angle at what point?—The tangent of the angle corresponding to a length of screen of 36 inches.

76. (*Sir E. Harland.*) Is that with the object of setting off the thickness of the chock?—Yes, the diagram shows the depth of chock required for angles of from 1° to 4°, but this particular depth of chock corresponds to a screening of 4°.

77. (*Mr. Ismay.*) According to the present practice?—The angle, yes; but the position of the wick is not in accordance with the present practice, because we now suggest that the centre of the wick shall be the centre of the curvature of the lens. We had a little trouble about it, for some makers set back the wick, without altering the construction of the lamp.

78. (*Chairman.*) I think it is your opinion, is it not, that the effect of this rule as to 4° in point of fact has decreased and not increased the actual angle of screening?—Yes, that is actually the case. I put in a statement prepared by the Secretary of the Rule of the Road Committee, which shows what has actually been the effect of the 4° rule.

79. It is in your view, is it not, undoubtedly the case that the angle before 1892 was a larger angle than 4°?—There is no doubt about it. I shall be able to put further evidence before you to show that that was the case.

80. Does this summary of the reports from the various districts, which you have put in, show that the angle was never less than 4°, though in many cases it appears to have gone up to as much as 10°?—No, the angle has been less than 4° in some cases, but in the majority of cases it has been either 4° or over. There are a number of measurements given in another paper which I propose to put in and they show that the angle has been smaller than 4° in some cases. On the other hand it appears from a return which was handed in to the Rule of the Road Committee by the marine superintendent of the Peninsular and Oriental Company that in 80 per cent. of their vessels the lights were screened to 4° or over, prior to their being rescreened in accordance with the 1892 Instructions.

---

* *See* Appendix 2, No. 1.
† *See* Q. 4920, 5057-9.

81. I think also you have one of the printed forms showing the information the Board of Trade desired from the Superintendent of Experiments at Shoeburyness, as to the side lights showing a uniform and unbroken light in colour, and power over 10 points of the compass?—Yes. That was one of the questions that we have always asked the Director of Experiments until quite recently. During the time that we issued printed forms to be filled up that was one of the questions which was invariably asked.

82. I should like to ask at once upon this, what you understand by the meaning of the words "right ahead?" Do you mean right ahead of the vessel or right ahead of the light?—I mean right ahead of the keel of the ship, and in conducting experiments at Shoeburyness we have nearly always stood upon the middle line to witness them; there is a middle line which is staked out for a distance of some two or three miles, certainly for over two.

83. You do not mean by "right ahead" actually at the bow; you mean right ahead at some distance?—At some reasonable distance from the ship, not close to the ship.

84. The regulation says that there must be a uniform and unbroken light of 10 points from right ahead. What exactly do you understand that to mean?—From right ahead of the ship to two points abaft the beam; that has always been my reading of it.

85. Taken on the horizon or at the bow of the ship?—I mean that if, for instance, you are two miles distant from the ship, you ought, provided it is clear enough to see the light, to see the same volume of light ahead of the ship as you would on any other bearing.

86. Down to the two points abaft the beam?—Yes.

87. Then I should like to ask, what do you understand by the phrase "across the bow?" Do you understand by that crossing the actual bow of the ship, or crossing the line of the keel at some distance ahead of the ship?—At one time I was of opinion, as I have stated in one of the papers, that it meant across the path of the ship, but on further consideration I have come to the conclusion that it always meant the bow of the ship herself, and I will tell you why. The screens, by the regulations, are required to be 3 feet in length; it would be absurd to suppose a screen 3 feet in length would prevent the light from crossing the path of the ship. If you had a screen 500 feet in length it would not prevent some rays of light passing at some angle. It is perfectly impossible to do it with any length of screen. You can do it with a chock, but there is nothing in the regulations about a chock.

88. It may be done by the screen being placed askew may it not, and there is nothing to show that the screen need be parallel to the keel of the vessel?—Yes, we have shown in one of the diagrams you have before you that it may be done, if you think it proper, by placing the screen askew.

89. By the use of the screen, apart from the use of the chock, it would be possible, would it not, to prevent any rays of light being seen anywhere across a line projecting from the line of the keel?—Yes, the screen then would not be parallel to the keel. Of course it would be askew. I think there are three models at this present moment in the Museum at at South Kensington, one, I think, of H.M.S. "Northumberland," showing the screens as they were formerly fitted. Unfortunately they are covered with glass, so that one cannot take the measurements of the screens, but the screens have no chocks I have not seen them myself. I am speaking from hearsay, and you will have a witness before you who has visited them. The screens are, I am told, parallel to the keel, and there are no chocks to them whatever.

90. I am a little anticipating, but I should like to know your opinion as to this point. Assuming that you desire to have, and must have, an unbroken and uniform light over 10 points from right ahead of the vessel, by which I mean right ahead of the keel at a certain distance, is that compatible practically in your judgment with the screen being so placed as to prevent the rays of light crossing this projecting line of the keel?—No, I think certainly not. I have never for one moment thought the rays of light would not cross the line of keel.

91. What I want to know is this. Assuming that you have, and must have, a uniform and unbroken light from a point straight ahead of the vessel on the horizon to two points abaft the beam; that is to say, an arc of 10 points—is that consistent, in your judgment, with all the rays being so screened as not to cross the line of the keel?—No, certainly not, it would be impossible.

92. Supposing you constructed a screen so as to shut off the red rays, and if you were crossing the projected line of the vessel at say, a mile and a half or two miles, what would be the effect on the appearance of the light at a distance straight ahead of the ship—would it seem dim?—You would not see it at all, except at a short distance. If you look at lights close to, you will see a certain amount of reflection from the lens, but that quickly disappears as you get away from the light.

93. So that, in your judgment, if you are to have an unbroken light over 10 points you must necessarily have the rays of light cross at some distance, and not a very long distance ahead of the vessel?—You must have them cross at some distance and not only that, but if you so screen the light that it cannot be seen ahead of the ship it cannot be seen ahead of the light either, because the only way that you can screen the light to effect that would be to absolutely mask it from ahead; and if this were done, you would not be able to see the full volume of light, as I think I have pointed out in one of the papers, until you get about a degree and a half on each bow.

94. What is in my mind is this, and I desire, if I can, to see how far the facts can be reconciled. The rule as to the unbroken light over 10 points and the rule that the lights are not to cross, as I understand in your view, these two rules taken in their strictness, that is to say, that the light is to be absolutely unbroken and that the rays are not to cross anywhere, are not compatible?—It would be perfectly impossible to prevent the light crossing, unless you brought the chock out to a point where it would absolutely shut out all the rays of light. You could not see the rays of light either ahead of the ship or ahead of the light itself.

95. (*Mr. Bolam.*) That is if the chock extends to the outside of the wick?—Yes. To enable you to see the whole light you would require to be about a degree and a half on the bow.

96. (*Rear-Admiral Andoe.*) If the line were drawn from the inner edge of the wick parallel with the screen, and the chock placed accordingly, then you would have the light right ahead, would you not?—Undoubtedly, and then it would cross at an angle of nearly one and a half degrees.

97. And it would give you sufficient light across the bow?—That I do not say. I do not think so.

98. The direct rays would cross at a certain distance ahead of the ship?—I place on the table another diagram which shows exactly the distance at which the rays would cross.

99. Do I understand the wick is not often placed in that position?—The wick is sometimes at right angles with the keel, and it is a question whether it is better to have it parallel with the chord of the arc or not. I have not made up my mind, but I know that my colleague, Mr. Samson, who has assisted me, is very strongly of opinion that the wick ought always to be at right angles to the keel.

100. (*Mr. Scrutton.*) Has this been a matter of experiment at Shoeburyness at all?—Not sufficiently so. We can only experiment during certain conditions of the tide, and it is very difficult to carry out as many experiments as might be desirable.

101. (*Chairman.*) Apart from the screens, does the construction of the lamp itself regulate the amount of light that would be seen round the horizon.

*Sir Digby Murray.*
27 Mar. 1895.

I mean this, the first rule is that the lamp is to be so fixed and so constructed that there will be a uniform and unbroken light for the 10 points?—Yes.

102. How far does the construction of the lamp itself ensure that, apart from the screen?—We have had quite recently to issue some instructions with reference to the construction of lamps in consequence of a new rule made in 1892, that the centre of the wick should be the centre of curvature of the lens. There is no statutory power to enforce this and it is only a recommendation. In some cases the makers put the wick back without altering the construction of the lamp, and the consequence was that the light was then screened by the housing of the lens.

103. Supposing that there was no provision whatever as to the screens, would it be practicable by mere construction of the lamp to ensure that there should be a uniform and unbroken light of 10 points and no more?—I have not considered that, but I think it would be extremely difficult.

104. The regulation provides that the lamp is to be so fixed and constructed, apart from the screen, that it shall show a uniform and unbroken light over 10 points, and I should like to know how it is to be determined that the light shall show only two points abaft the beam. You have no screen there at all?—No, but still if the light will only show for the given number of points, and it is properly fitted and screened in one direction, the other, I think, follows; and besides, it does not matter whether the light shows with absolute accuracy to two points abaft the beam or not. It does not matter if there is a variation of two or three degrees abaft the beam. And experiments at Shoeburyness have shown that lights do vary somewhat in this respect.

## Thursday, 28th March 1895.

PRESENT:

THE RIGHT HON. SIR FRANCIS H. JEUNE IN THE CHAIR.

Rear Admiral ANDOE.
Captain WILSON BARKER.
Mr. BOLAM.
Captain CASTLE.
Sir EDWARD HARLAND.
Captain HUGHES HALLETT.
Mr. ISMAY.
Mr. SCRUTTON.
Captain THOMSON.

Mr. C. HIPWOOD, *Secretary.*

Sir DIGBY MURRAY recalled and further examined.

*Sir Digby Murray.*
28 Mar. 1895.

105. (*Chairman*). With regard to the suggestion that was made to surveyors, from 1868 up to the issue of the new rule in 1892, can you state to what angle the light would have been screened from the outer edge of the wick if this suggestion had been complied with by the surveyors?—It would depend upon the position of the wick in the lamp; but in lamps of the patterns manufactured prior to the instructions of 1892 I found, after very careful measurement, which was in each case independently verified, that the mean would be 4° 30′. The patterns measured represented many thousands of lamps. I put in a list of the measurements.*

106. (*Sir E. Harland*). Measuring from the outside of the wick?—Yes.

107. (*Chairman*). Were those suggestions which you have mentioned, that is to say, the suggestions issued to Surveyors from 1868 up to the issue of the new rules in 1892, regarded as definite instructions to the surveyors, or were they only recommendations?—They were only recommendations, and the consequence was such a diversity of practice as rendered precise instructions imperatively necessary. Many of the surveyors have personally thanked me for their having a precise rule to guide them.

108. I think at our last meeting, you put in a summary† of the reports from the Board of Trade officers showing what the actual practice was as regards screening prior to 1892, and a form of report‡ made by officers testing ships' lights. Is there anything you desire to add with regard to these two papers?—Merely that the summary was drawn up by the Secretary of the Rule of the Road Committee, as I preferred not to do it myself, and that the form of report shows what was in the mind of the Board of Trade from the very earliest date as to the light being uniform and unbroken.

109. Uniform and unbroken over ten points of the compass, that is to say, from right ahead to two points abaft the beam?—Yes.

110. I see it is a precise angle. Does the light show more than 10 points from right ahead, and if so, how many degrees more?—The light does show over somewhat more than 10 points, but a uniform and unbroken light shows over ten points of the compass only, namely, from right ahead to two points abaft the beam.

111. In your opinion, what is the proper angle to which side lights should be screened?—4° inwards.

112. That is to say 4° from the outer edge of the wick?—Yes.

113. What are your reasons for thinking this is the proper angle?—Because if they were screened to a finer angle ships steering parallel courses and bearing from 1° to nearly 4° on each other's bows would, if they did not alter their course, pass either dangerously close or else come into collision; and as they are not crossing ships there is, up to the present moment, no regulation which would apply to them. I put in a table showing what would happen at distances of a quarter and half a mile if these vessels maintained their course.* And I may remark that the bearing of 4° is the bearing from the outer edge of the light, not from the middle line of the ship, and that consequently if the ships bore 4° from each other, their side lights would not be visible from both sides of the bridge.

114. You say in this paper 4°, that is to say something like a third of a point, from the outer edges of the wicks of the two lights, is that so?—Yes.

115. I do not quite follow that because I see in your paper you have put 4° and 3° on each other's bows. Do you not mean 4° from each other's lights?—No, I mean the ships are 4° and 3° on

* *See* Appendix 2, No. 9. † *See* Appendix 2, No. 2.
‡ *See* Appendix 2, No. 3.

* *See* Appendix 2, No. 4.

each other's bows. I am not referring to the lights, but the bearing from the extreme outer rays of the lights is as stated in the paper.

116. I see, the table is headed "ships distant a "quarter mile (500 yards) from each other, and bearing from the intersection of the extreme outer rays "of their side lights 4°, 3°, 2°, and 1° from each "other"?—Yes, that is so. The bearing is given from the intersection of the extreme outer edges of the lights, but it would have made no difference to the result if it had been taken from the lights instead of the intersection.

117. I am afraid that I do not exactly follow that?—All I mean is that if instead of taking the bearing of a vessel from the outer edge of the wick, you take it from the middle line of the ship, there is, of course, a slight difference in the angle That is all that I mean.

118. But if you take it from the outer edge of the light?—It would be exactly the same thing as taking it from the intersection; the bearing would be the same.

119. You say that it makes no difference whether the bearing be taken from the point of intersection or from the outer edge of the rays?—Yes.

120. What you are saying in this paper is that ships on parallel courses and in certain positions to one another will, if they follow the rule "green to green, red to red, perfect safety, go ahead," come into collision if they keep their course?—Yes, and it does not make the least bit of difference whether you take the bearing from the outer edge of the light or from the point of intersection; the result is the same. But if, on the other hand, you take the bearing from the middle line, you decrease the angle.

121. Of course you do; the bearing from the middle line may be nothing, and would be nothing?—The angle would be only very slightly decreased in this particular case.

122–6. The ships are steering parallel courses and keeping their courses and you say no article of the Regulations applies to them; why do you say that?—Because they are not crossing ships and there is no article which does apply to them. A ship is compelled to keep out of the way of all crossing vessels which are on her own starboard side, but *these* ships are both on the starboard side of one another.

127. What lights would a vessel in *that* position see?—The mast head light and the green light.

128. And the green light a little on the starboard side?—Yes.

129. And then you say that under those circumstances supposing she did nothing, the effect would be that there would be a collision?—Yes, if they absolutely kept their courses; and at all events they would get so near to one another as to be dangerous. What I find is, that when ships get so close to one another something nearly always takes place which brings about a collision. You will see the paper I have put in only refers to ships a quarter of a mile and half a mile apart, and in foggy weather at sea you constantly do not see a ship until she is half a mile from you, and sometimes not even until she is within a quarter of a mile of you, and sometimes you do not see her at all.

130. The point, is it not, is this, that if the lights of the ships were so screened as to be thrown straight forward parallel to the line of the keel and not to cross at all, you suggest that that would be a position of difficulty?—I suggest more than that, I suggest that with lights crossing at small angles, there would be a position of great difficulty, especially in the case of ships of great beam. I have not gone into the question of lights screened in a line of the keel, and in this table I have stopped at 1°.

131. You have considered angles of 4°, 3°, 2°, and 1°, and you say that in some cases even 4° presents difficulty?—Yes, when the ships are of very great beam. We have no ships of 70 feet beam out of the Navy, but we have ships in the Merchant Service at the present time of over 65 feet?

132. Then to put it shortly, it really comes to this. Vessels approaching in that position, when their lights are screened even in some cases to 4° would be in a position of seeing only one light of the approaching vessel, and therefore would be misled or might be misled as to what was their duty to do; it comes to that?—Yes. There would be no rule whatever applicable to them, and the regulations would not apply.

133. You mean that the vessel having green a little on her own starboard side would not be under any obligation to keep out of the way of the other vessel?—If there was only one of them crossing, certainly she would have to keep out of the way.

134. But both?—Both having green on the starboard side?

135. Both having green on the starboard side neither is under an obligation to keep out of the way. That is what you mean to say?—No, not quite that, but perhaps if you will allow me to go on to the next paragraph and refer to Mr. Gray's remarks on the Regulations for Preventing Collisions at Sea, which are at least semi-official, I can better explain what I mean. Perhaps you would allow me to read part of the preface and also part of page 7. "These "remarks have received the official approval of the "Admiralty, Board of Trade, and Trinity House as "well as of the French Government; and the con-"struction of Articles 11 and 13 advocated has been "made positive and binding by an Order in Council."* This latter is foreign to my purpose at present. I only allude to it. Then, if you will turn to page seven, this is what is said: "Everyone is unanimous "in agreeing that no two ships can come into collision "so long as they show each other the same coloured "light, green to green, or red to red.

"7. The rule cannot therefore apply—

"(*a.*) When a green light is seen anywhere on the "starboard side;

"(*b.*) When a red light is seen anywhere on the "port side;

"(*c.*) Nor can it apply when a red or a green light is seen ahead." And therefore what I am arguing is that under the circumstances the ships are left without rule, and that if a fine angle of screening is decided on, it will, I think, be very mischievous, unless the regulations are altered.

136. Of course you will be prepared for the answer that supposing two ships were in that position and each saw the other coming on with the light getting no broader, that then it would be the duty of one or other of the ships or of both to take action?—You mean to say the bearing would alter so little as to convey to the master an intimation of danger and that would be decidedly the case where two ships only are under observation. But the misfortune is that in the Channel and other narrow waters you very frequently have six or seven vessels all approaching at the same time, and it is an absolute impossibility for the master commanding a ship making, for instance, the Irish Channel, where he would probably have the Irish land aboard, and all the other steamships on his starboard side, so that he would have to get out of the way of the whole of them, to tell how those ships were standing relatively to his own ship, as he certainly could not carefully watch the bearing of the whole of them.

137. Do you desire to say anything more about this table?—No. I think the table will sufficiently explain itself.

138. (*Mr. Scrutton.*) Could we have a diagram to illustrate this table?—Yes, I will have one prepared and put it in later.† I have several diagrams on the table and after my examination is finished I should like to bring them to the notice of the Committee. I should think some of them would convey a large amount of information.

139. (*Chairman.*) What are your reasons for thinking that 4° is the proper angle?—Mr. Gray's verses

* Order in Council of the 30th July 1868.

† *See* Appendix 2, No. 4.

*Sir Digby Murray.*

28 Mar. 1895.

which were approved by the Admiralty, the Board of Trade, and the French Government, and which have been translated into almost all languages, are known, in all human probability, to every nationality in the world, including most of the Eastern nations:—"Green to green, red to red, perfect safety, go ahead," would with smaller angles, be positively misleading. These verses were intended to apply to lights screened in conformity with the angle of screening approved by the Admiralty, the Board of Trade, and the Trinity House, as shown in a parliamentary paper of 1869, a copy of which I put in,* and were never intended to apply to finer angles.

140. We have been told that screening to the 4° angle is dangerous; what is your opinion as to that?—It is not dangerous. Steam ships approaching one another and bearing 4° on each other's bows have only to port half a point to clear one another. If they port one point they will pass a long way clear of one another, and this when they are steering parallel courses, which is the most crucial position. I put in a large diagram to prove this, and I think I may say, as an old master of a ship, that I never knew a man to port to so small an extent as half a point to clear another ship. I should say that one point was the very least he would port, and, you will see from the diagram I am just going to put before you, that it is perfectly safe even if the two ships port half a point; but if they port a point, they will go abundantly clear. These are two ships [*pointing on a diagram*†] one mile apart—that is to say, 2,000 yards. These marks which you see opposite both ships indicate half a point and a point. If the two ships port half a point they will pass 183·5 feet clear of one another at the middle distance. On the other hand, if both port one point they will pass 765·5 feet clear of one another.

141. (*Rear-Admiral Andoe.*) What does the half point give?—183½ feet. The distance is rather fine, but still the ships would go clear, and I never knew a man port as little as half a point.

142. 183½ feet at the middle distance between the two ships?—Yes.

143. (*Chairman.*) The red lines on the diagram represent the port lights?—One is the red light of the one ship, and the other is the red light of the other.

144. One of the vessels would show both red and green?—Yes. I have not thought it necessary to put in the green because it is evident they both see one another.

145. Do these lines on the diagram show the extreme limit at which a vessel would see the light?—I do not follow.

146. Do the lines define the limits within which one vessel would see both lights of the other?—Yes, if they were each to come ahead only a ship's length they would not be able to see one another's two side lights. They have only to keep their course a very short distance and they would not be able to see each other's two lights.

147. (*Captain Hallett.*) The diagram only shows ships at short distances?—Because I think, as a rule, ships do not alter their helm to get out of one another's way until they are about a mile apart, and it is only under very rare circumstances of weather that you will see the lights anything like two miles.

148. They will be twice as far apart if they alter their helms at two miles?—Yes.

149. So that the same course will take them twice the distance apart?—No doubt, whatever, but the angle will be exactly the same.

150–1. (*Chairman.*) These side lights are screened to 4°?—Yes.

152. What I understand your view to be is, that although it is quite true that each vessel would take the other to be "end on" to herself, yet this would not present a position of danger, because each vessel would be sure, under these circumstances, to port, thinking she was end on?—She would be sure to port at least half a point.

153. And that half point would clear her you say, and she would not be content with porting half a point, but she would port a full point in all human probability?—I should say that each ship would port not less than a point.

154. And that would carry her clear?—Abundantly clear.

155. So that although two vessels might believe each other to be end on when they were not end on, still there would be no danger if each ported?—I say there would be no danger whatever in screening the lights to such an angle.

156. (*Sir E. Harland.*) And that is the worst case, each crossing the bow of the other?—Yes.

157. (*Chairman.*) The ships being supposed to be on parallel courses when they sight each other?—Yes.

158–62. (*Rear-Admiral Andoe.*) At what distance would they pass if they continued their distances from each other?—You wish to know what would happen if they kept their course?

163. I only want to know what distance there would be between the two, supposing they continued their course without altering their helm?—If they continued their course without altering their helm, they would pass abundantly clear. I can tell you exactly, 400 ft.

164–7. If they ported half a point they would not actually come into collision?—No, it would take them 183½ feet clear of one another, and if they ported a point it would take them 765½ feet clear.

168. You are assuming each to port?—Yes, it is the business of each to port.

169. I understand now?—It is the business of both of them to port.

170. If each ports half a point the distance between them will be 183½ feet?—Yes.

171. 183½ feet?—Yes.

172. And if each ports a full point then the distance between them at the middle distance will be 765 feet?—Yes.

173. And if each ship keeps her course, they will clear each other?—Undoubtedly.

174. (*Sir E. Harland.*) If each ports half a point, the total will be a point?—Yes.

175. If half a point gives 183½ feet, how could the whole point give 765 feet?—If you measure it I think you will find it as I say.

176. I should have thought, roughly, it would have been double?—They are both porting it.

177. (*Captain Thomson.*) There is only one little matter which has not been allowed for in this theoretical diagram, and that is, when vessels alter their helms, they do not change course immediately in a straight line; the centre of gravity of the vessel continues more or less in the original direction. This is not important at long distances, but at short distances it tells against the diagram.

178. (*Rear-Admiral Andoe.*) I think that is only theoretical. It would hardly affect the practical working of single ships at sea, although in squadrons it has to be taken into consideration?—It would be a very short time before she assumed the direction due to the helm in the course of alteration of only one point. I think, for all practical purposes, you might dismiss that from consideration.

You must remember one thing and that is that I am giving you no opinion as to what the screening of side lights ought to be under any circumstances other than those which I have to deal with. I have to deal with the regulations for preventing collisions at sea as they stand. I have to deal also with what has become the practice of seamen owing to Mr. Thomas Gray's verses. I am rather radical in my views as to lights. I do not think that the side lights are a sufficient indication especially when you have seven or eight ships approaching you at the same time; and I think there ought to be some further intimation; and, in the course of time, seeing that our steam tonnage is enormously increasing, we shall be bound to have

* H. C. 114 of 1869, *See* Questions 26–37.
† *See* Appendix 2, No. 13, and diagram.

something. I am putting in a diagram, not with a view to the Committee recommending any alteration in the regulations for preventing collisions at sea but simply that they should be able to see what for many a long year has been in my mind on the subject. It is perfectly easy with this plan to see when ships are approaching one another in such a direction as to hit one another with their stem. A man who has a number of ships on his own starboard side has to get out of the way of all those ships. If these suggested lights were adopted, he would know at once which of these ships he would require to keep the run of and which he could absolutely dismiss from his mind, and I think that would be a very, very great factor in the direction of safety.

(*Rear-Admiral Andoe.*) Should not that be considered later?

(*Chairman.*) Yes, my impression is that the reference to us ought strictly to be limited to what ought to be done considering the international regulations as they stand.

(*Sir Digby Murray.*) I am not asking the Committee to adopt it, it is merely for information.

(*Chairman.*) I daresay the Committee would think it right to consider it later.

179. (*Mr. Ismay.*) May I ask whether you have a diagram showing what would happen if lights were screened to 3°?—I have not a diagram on a large scale with reference to 3°, but if the Committee want one I could very readily have one prepared.

180. (*Sir E. Harland.*) I should have thought it would be very satisfactory to have a diagram illustrating 4°, 3°, 2°, and 1° and see what it amounts to?—I will put in such a diagram.*

181–3. (*Sir Digby Murray.*) Here is another diagram. It may be of use to the Committee later on; it shows ships of different beams with the intersection of their lights when these are screened to 1°, 2°, 3°, and 4°.

(*Chairman.*) That will be very useful but we must come to that presently.

184. Is it not the case that reflected light is seen at a greater angle than that to which the lights are screened?—Sometimes in the case of dioptric lenses at very short distances, this varying with the condition of the atmosphere. With other lenses the reflected light would probably not be seen at a greater angle. Mr. Samson and I experimented† with a pair of full sized side lights having plano-convex lenses, with the result that at 840 feet from the lamps the green light could only be seen 17 feet from the middle line, instead of about 29 feet. The red light showed somewhat in excess of the theoretical distance, but it is to be remembered that it is the faintest thread of light which is seen, and would never at sea attract attention or be visible except through powerful glasses; and I think I may say with reference to this that when these experiments or the result of these experiments are seen by people who have not themselves attended them, they are apt to think that the distance at which these lights are practically visible is very much greater than it really is. I am perfectly certain that at sea where you always get an incrustation of salt on the lenses sometimes to a very considerable extent, that you would not see the lights to anything like the theoretical distance from the middle line. And the experiments at Shoeburyness of October 1893,‡ which relate to unusually good lamps, and which were most carefully conducted and reported upon by the Director of Experiments, show that the green light never showed to the theoretical distance from the middle line. At 2,000 yards the distance observed was 399 feet; the theoretical was 404·5 feet. At 1,000 yards the observed distance was 180 feet; theoretical 194·8. At 500 yards the observed distance was 84 feet, theoretical 89·9 feet. The red for all practical purposes agreed with the theoretical distance. In one case it showed 3½ feet more and in another 6 feet more, and another 3 feet less. On board ship where there is always a slight incrustation of salt on the lenses, and the lamps cannot be in the same excellent condition as to cleanliness and trimming as they are when used for experimental purposes, they probably do not show to anything like the theoretical distance to the right and left of the ship's path.

185. What would be the result of screening the lights to no angle, *i.e.*, in a line with the keel?—There is only one way of doing this, *i.e.*, by increasing the depth of the chock so as to mask the whole of the light when viewed either from ahead of the ship or from ahead of the light, and the full volume of the light could not be seen at a smaller angle than about 1½° on either bow.

186. I observe you say the "*full* volume of light," would there be some light, say, straight ahead of the vessel?—No, not ahead of the vessel, nor ahead of the light; you would have to be a little on one side of the chock to see it.

186*a*. Supposing the light so screened that the chock should mask the whole of the light, what would be the breadth of water at a thousand yards before the whole volume of light becomes visible?—At a thousand yards?

187. Two thousand yards—I mean a mile?—Well it would be exactly half the breadth between the inner edges of the two lights plus the distance due to the angle before the whole volume of light would become visible.

188. I understand you to say you would have to be 1½° on either bow to see the light. What would 1½° on either bow give you of dark space at a mile?—I will let you know. The dark lane will be the distance between the outer edges of the two side lights, but I cannot answer as to the distance at which the full volume of light would become visible without working it out.

189–92. What I wanted to know was, supposing the lights screened in this way, what would be the breadth of the dark lane?—It depends entirely on the distance between the outer edges of the two lights, and differs in every ship in accordance with the breadth. On the other hand, the distance from the middle line at which the full volume of light becomes visible depends on the half width between the inner edges of the wicks.

193–4. (*Chairman.*) That would be so, of course. To take the ordinary case I should like to know what it would be taking the same breadth, as you have taken for the other purpose, say, 30, 40, 50, 60 and 70 feet?—If you will tell me exactly what it is you want I will put it in.*

195. (*Sir E. Harland.*) Then a further question arises. Although you screen the light theoretically, still there would be straight rays, as it were—a ray of half the width of the wick?—Exactly.

196. Would that cross the centre line of the vessel?—No.

* If the wick is one inch in breadth and placed at right angles to the keel, one inch will be the tangent of the angle = 1° 35′ 15″ the length of the screen being 3 feet, *i.e.*, 36 inches.
If the wick is placed parallel to the chord of the arc, ·8 of an inch will be its transverse breadth, equal to an angle of 1° 16′, the length of the screen remaining the same.
The distance in yards from the ship's path will be as follows:—

| Distance in yards from the Wick. | Tangent 1 inch, =1° 35′ 15. | Tangent ·8 of an inch, = 1° 16′. |
|---|---|---|
| | Distance. | Distance. |
| 500 | 13·86 yards | 11·10 yards |
| 1,000 | 27·72 „ | 22·11 „ |
| 2,000 | 55·44 „ | 44·22 „ |
| 4,000 | 110·88 „ | 88·44 „ |

To the above must be added one-half the breadth between the inner edges of the two lights. For instance:—

| | | |
|---|---|---|
| 1,000 yards | 27·72 yards | 22·11 yards |
| 7 „ | 7 „ | 7·00 „ |
| | 34·72 yards | 29·11 yards |

* See Appendix 2, No. 4, Plate VI.
† See Appendix 2, Nos. 5 and 6.
‡ See Appendix 2, No. 11.

*Sir Digby Murray.*

28 Mar. 1895.

197. Two miles off?—No.

198. Three miles?—No, because if the chock entirely obscures the light you first see the full volume of light when you are about 1½° outwards from the light.

199. (*Chairman.*) I see. The lights can only be screened in line with the keel by masking the whole of the light from ahead?—I could let you have further details by the next meeting.

200. That would give us what we want?—I may add that what takes place is simply this; to ascertain the angle at which the full volume of light becomes visible, all you have to do is to take the transverse width of the wick, and that is the tangent of the angle at which you see the whole light outwards.

201. Perhaps the thing can be worked out in a little more detail for the information of the Committee. I should like to know myself what would be the breadth of the dark lane at a mile with the lights screened to 1°. Would there be any dark lane if it was screened at 1°?—Yes, there would until you get a very considerable distance away from the ship, but you would never have the full volume of light ahead of the ship if it was screened to 1°. I have shown that in a paper* which you have before you. "The full volume of both lights cannot be seen on the middle line at any distance." The figures underneath show the angle at which the whole volume of light becomes visible.

202. (*Mr. Scrutton.*) That is in Departmental paper No. 179?—Yes, page 6.

(*Chairman.*) "Table showing the theoretical "minimum distance at which the full volume of both "the side lights can be seen at a point on the middle "line ahead of the ship, *i.e.*, directly in line with the "vessel's keel, wicks 1 inch in breadth and placed "vertically to the screens." Then there is the breadth of the wick, and the distance from the wick to the chock, 36 inches. Then at 1° the full volume of both lights cannot be seen on the middle line at any distance.

(*Sir D. Murray.*) I may say we have wicks considerably broader than that, but I did not want to go into extravagant measurements. We require wicks for colza oil to have a width of 1¾ inches, but I have kept myself to the smaller measurements.

203. It has been stated that if lights were screened in this manner, that is to say, screened in a line with the keel and so as to mask the whole of the light from ahead, then the lights would not both be visible at one and the same time, but the yawing of the ship would show first one light and then the other. What have you to say about that?—My experience of large powerful passenger steamships is, that in fine weather they steer nearly a straight course, and at all events do not yaw sufficiently for this purpose, and if this were possible it would be contrary to the regulations, and also most dangerous. I would call attention to the following extract from a memorandum of my own written in 1889, which was not intended to apply to this particular subject, though it appears now to be very pertinent to it. It was a paper placed before the Rule of the Road Committee before the English delegates left for Washington, and I was then a member of the committee appointed to consider what amendments should be proposed in the regulations. These are the remarks: "Collisions in my opinion "are for the most part attributable to one of the "following causes:—(1.) Bad look-out. (2.) Non-"compliance with the regulations for preventing "collisions at sea. (3.) Injudicious compliance "with Article 18 of the regulations. (4.) Error "in judgment and vacillation on the part of the "officer in charge of the deck. With the excep-"tion of (4), all these conditions have been already "more or less alluded to. The following is an "example of (4): The officer of the watch of a "steamship sights a red light a little on his star-"board bow and ports to it. The next moment the "red light is shut in, and the green light opened out. "He then shifts his helm and puts it hard-a-starboard. "A moment afterwards he sees both side lights, and "stops and reverses his engines, when a collision "occurs," and I cannot tell you how numerous the cases have been which have come under my notice of this kind. "According to the statement of this "officer the vessel he was approaching did not keep "her course, but kept alternately porting and star-"boarding, whereas what really occurred was that a "small vessel approaching him in almost a direct "line yawed, so as to show alternately each of her "two side lights, and had the steamer been kept "under her port helm she would have easily gone "clear.

204. Perhaps you will tell us what the view taken by the Washington Conference was with regard to this question of intersection of side-lights?—"General "Division 1–5. The lantern should be so constructed as to ensure the light having at least the required minimum power in the ideal line connecting the "lantern with the horizon, even though the vessel "be heeled one way or the other 10°. General "Division 1–8. The side-lights should be so screened "as to prevent the most convergent rays of light "being seen across the bows more than half a point." That was what they arrived at, at the Washington Conference, and I may say that I thought 10° was not sufficient. I know that many of the narrow ships laden with grain arriving at Liverpool years ago, had 22° or 23° permanent list, and therefore what we have asked for in our instructions is, that there shall be a vertical divergence of 20°, both above and below the horizontal plane. As they are building ships now with much more beam than they were in those days, I am not quite sure that it might not be reduced to 15°. The Admiralty, I believe require 10°.

205. The recommendation of the Conference was that the most convergent rays of the light should not be seen across the bows more than half a point. What number of degrees does that correspond to?—5° 37′. I think perhaps as you have asked that question, I may say that when I carried out my experiments in 1891.* with a view to ascertaining what the angle should be in accordance with the Washington Conference, I had not quite an open mind on the subject. I talked the matter over with the Hydrographer, and we both came to the conclusion that 3° was the proper angle judging solely from paper, but when I came to carry out the experiment, it struck me that that was too small—that we could not possibly go in for so small an angle.

206. And so you increased it to four?—We increased it to 4°. We originally screened them, as you will see, at three, and the idea both of Mr. Samson, who accompanied me, and myself, was that three would be the proper angle; but you see we cannot say that all vessels are to have dioptric lights to begin with, and with those plano-convex lenses the green light only showed to a distance of 17 feet from the middle line instead of 29 feet, 29 feet being the distance to which it should have shown theoretically.

207. You conducted some experiments on the 5th of May 1891 with the lamp screened to 3°?—Yes, and the reason we did not continue them was that we felt that with some description of lamps at all events, it would not answer.

208. (*Mr. Ismay.*) If you could have the best description of lamps then you think 3° is enough?—At one time I should have said yes, but now I have more thoroughly considered the subject I do not think it desirable to screen to a smaller angle than 4°. That is, of course, on the assumption that the present regulations remain unchanged. If you alter the regulations then I think you might alter the angle.

209. In what way would you alter the regulations?—So as not to leave ships without any regulations to guide them. There is one thing that is quite evident, and that is that if two vessels are bearing 4° from one another on the port bow, both the side lights of each ship being visible to the other no danger can arise if

* *See* Appendix 2, No. 7.

* *See* Appendix 2, No. 5.

they port, because they will not cross one another's tracks; but if, on the other hand, each is on the other's starboard bow, there may be a danger in porting if the angle is too great, because each must cross the track of the other.

Perhaps I may be allowed to refer back to the statement I made yesterday, as to the instructions of 1875, because after what took place at the committee I thought it was necessary that I should very carefully consider whether I ought in any way to modify the statement I made; and if you will permit me I will read the conclusion I have arrived at:—"I have carefully considered "the statement made by myself that the word *wick* in "the instructions of 1875 was a misprint for the word "*lens* and I am still of that opinion because (1.) I was a "member of the Rule of the Road Committee in 1875 "and I do not think such a radical alteration would "have been made in the instructions without my being "consulted, or at least informed of it. (2.) Because "it is an absolute contradiction to the paragraph "immediately preceding it and also to diagrams 7, 8, "9 and 10. 6 does not apply. If it is not a mis-"print then with an inch wick parallel to the chord of "the arc, the angle would be 1° 16′; and to this I "am sure the late Mr. Thomas Gray would never "have assented, and I should have opposed such an "angle to the utmost of my ability as being in my "opinion absolutely dangerous. Besides other dis-"advantages such an angle would not admit of the full "volume of light being seen ahead of the ship."

210. Now, I think, there are certain papers which you were going to be good enough to produce to the Committee?—Yes. They are as follows:—

Instructions to Surveyors. Lights and Fog Signals.*

Remarks on the Regulations for preventing Collisions at Sea, by the late Mr. Thomas Gray, as approved by the Admiralty, the Board of Trade, and the Trinity House as well as by the French Government.†

Return to the House of Commons dated March 19 1869.‡

Reports by Mr. Samson and myself on the Experiments of May 1891.§

In addition I think I had better put in the diagrams and the report from the Director of Experiments at Shoeburyness relating to these experiments of 1891.‖ And in doing so I should like to call the attention of the Committee to one statement made by him. The lights that we were trying were a pair of lights which were expressly manufactured for the Board of Trade by Harvie. They are very much larger than ordinary ships' lights. They have duplex burners with 1¼-inch wicks, and they burn about twice and a half the quantity of oil that an ordinary lamp does. The point to which I wish particularly to call your attention is that at 4,000 yards the red light was visible 286 yards from the middle line, and the green light was visible 225 yards from the middle line.

211. How were they screened?—They were screened to 4° and the Director of Experiments made this note. He says:—"The above two distances "correspond to rays making at the theoretical crossing "point, angles with the centre line of 4° 10′ for the "port light and 3° 17′ for the starboard." You see at that distance there was a difference of 1° in the apparent screening of the two lights.

Then there is the memorandum by myself contained in Departmental Paper, No. 179.¶

Further memoranda by myself as to screening.**

The next is a letter from Mr Samson,‡‡ the principal assistant to the engineer-surveyor-in-chief, to myself in accordance with my request that he should draw up a memorandum showing the general effect of screening ships' lights in such a manner as to produce forward of the vessel a direct parallel line.

A letter from the German Lloyd to the Board of Trade.††

212. (*Chairman.*) Is there any other information from foreign nations with regard to screening?—We have had letters from Belgium, Denmark, Chili, the United States, and the Netherlands, on the subject.*

The appendices and diagrams referred to in the foregoing papers and in my evidence generally.

The reports of the experiments made in October 1893.†

Then there is the diagram I referred to before. I do not think it is necessary that it should be put in. I put it before the Committee for their information. [*Producing and describing the same.*] This is a vessel which is obliged to keep out of the way of all vessels on her own starboard side. Please dismiss from your minds all ideas of distance. It is not intended to show distance. Now if every vessel was obliged to have a second masthead light showing 2½° on each bow, then when a vessel entered either the English or the Irish Channel and saw a number of masthead lights on her starboard side she would know at once which of those vessels were approaching her with risk of collision to herself; and the information would enable her readily to avoid all those which were dangerously approaching her.

213. The suggestion in this is that the masthead light at present shows at too great a range, is that it?—The present masthead light conveys very little information, and in thick weather you are very often very close to the side lights, especially in fast ships, before you see them. And in addition to that, the coloured lights absorb much of the white light. In one of the papers I have handed in‡ I have estimated as nearly as I can ascertain the percentage of colour that is absorbed, it varies with the depth of the colour. But with the lights I am suggesting, you would be able to tell at once whether the vessels were approaching you with risk of collision. This new light I call the danger light and the vessel that is to keep out of the way should never open the danger lights of these other vessels unless they were broad on the bow. If they were broad on the bow the officer in charge would be able to judge whether he could cross ahead of them with safety.

214. (*Sir E. Harland.*) This drawing does not seem to show the position of the second masthead light?—The mechanical drawings will be put in should the Committee desire to see them, by a witness who follows me, Mr. Samson, who has got them out under my instruction.

215. Do I understand there is one light above another?—Yes, the second masthead light is 12 feet or as much less below the other as may be necessary and the light should show 2½° on each bow only; whereas the other masthead light shows for 10 points on each side.

216. (*Chairman.*) You suggest that there should be two masthead lights?—Exactly.

217. The one there is at present showing 20 points, and then another one showing only 2½° on each side of the bow?—Exactly. I mean to say that it would be productive of a very large amount of safety and would relieve many a man from a great deal of anxiety.

218. (*Sir E. Harland.*) Would two masthead lights on the same stay lower down, not answer the purpose better?—No, I think you want this lower light confined to a small angle on the bow.

219. (*Chairman.*) The point is, you think that 20 points is too much?—It merely tells you that there is a steamship there.

220. (*Captain Hallett.*) How would you legislate for towing lights?—If this was adopted it would require a recast of the regulations, and I am not proposing that the regulations should be recast. I am only saying that if it is desirable to have a fine angle of screening then I think this is the better way of arriving at it.

221. (*Chairman.*) That is the way you wish to put it, namely, that if you are to screen very fine it would

* See Appendix 2, No. 1. † See Question 135.

*Sir Digby Murray.*

28 Mar. 1895.

be a safer thing to add a second masthead light showing 2½° on each bow?—Yes.

222. (*Captain Thomson.*) I am afraid it would be impracticable?—I will leave it to the witness who will follow me, who is an extremely able man, to put before you the mechanical drawings showing that it is perfectly practicable.

223. (*Captain Thomson.*) 2½° on either bow, 5° altogether?—Yes.

224. Is it not a fact that masthead lights, as at present fitted, oscillate more than 2½°?—That is a mechanical difficulty which can be got over. I do not say that they do not, but you can get over it. And I think you will see from the drawings that as far as these lights are concerned the mechanical difficulty has been got over. I have here several other diagrams which may be of use to the Committee.

225. (*Chairman.*) The object of this diagram seems to me to be a very interesting one, because it is crucial upon the point of the dark lane, or dark triangle, or whatever you choose to call it. With a ship of 30 feet beam and lights screened to 1° you get a dark triangle extending to 859 feet from the ship. Then you get, if it is 4°, 214 feet. Then we will take the extreme case. Here is a vessel of 70 feet beam, I suppose that is extreme?—It is extreme for a merchant vessel.

226. Here is a ship of 70 feet beam screened to 1° and in that case the triangle extends to 2,005 feet. As I understand that represents the theory?—It represents the exact angle.

227. (*Mr. Scrutton.*) But do not the rays of the light extend beyond that line?—No. You have already had my evidence upon that point. At a very near distance they do, but when you get at a considerable distance from the light there is no reflected light whatever to be seen, and in the majority of cases they do not even show for the theoretical distance from the middle line.

228. (*Chairman.*) I do not think you would suggest that any danger would arise from the "dark triangle," which would exist if the lights are screened to 1°?—You could not see the full volume of light ahead of the ship as I have pointed out in the table I have put in.*

229. Strictly speaking not. That is perfectly true, but in this "dark triangle," theoretically you would see no light at all?—You would not. I may say that when the Rule of the Road Committee visited Shoeburyness for these experiments we at once gave up all idea of anything less than 2°, after trying it. The Committee said at once they did not want to see any more experiments with reference to the smaller angles.

(*Rear-Admiral Andoe.*) There is the case where in walking from one side of the bridge to the other you first of all see one light, and then the other; you do not know what the ship ahead of you is doing, and it would be very puzzling.

(*Chairman.*) I should have thought that if walking on one side you saw the red light, and walking to the other side of the bridge you saw the green, the conclusion to which you would come would be that you were within the lights, and that the vessel was end on in front of you.

(*The Witness.*) It is not practicable for a man to keep walking from one side of the bridge to the other in order to know exactly what lights are visible.

230. (*Rear-Admiral Andoe.*) Then the red light is much stronger than the green, and appears to be nearer to you?—Yes, very much more of the white colour is absorbed by the green.

231. (*Chairman.*) You wish to make some remarks, I understand, as to the position of the wick in the lamp?—Yes, the papers I have here show rather in an exaggerated form, the position in which the wick used to be placed in the lamps. It was not placed in the centre of the curvature of the lens, and when we required it to be placed in the centre of curvature the wick, in many cases, was moved, without the lamp being altered. The consequence was that some of the light was masked by the housing of the lens. That is the reason we are compelled to ask that the lenses should not be less than 120°. There is a diagram on the table showing it exactly. [*Producing diagram.*] All we ask for in our instructions is that the lens shall be 120°, and that not to enable the full and uniform light to show over a greater angle than ten points, but to enable the full light to be seen ahead of the ship.

232. Otherwise you cut off some of the rays?—Otherwise you cut off some of the rays, and that in many cases takes place in consequence of their moving the wick back to comply with our instructions. Many of the shipowners have been arguing that we have no business whatever to require this number of degrees; but then if we do not, we cannot require the centre of the wick to be the centre of the curvature of the lens, and that is the best place for it, because then all the rays are reflected backwards and forwards through the centre of the wick, and the refraction will then be a minimum.

233. I suppose you think, and the Board of Trade think, that under the Regulations they have power already to insist upon 120°?—I think so.

234. Otherwise the lights would not fulfil the statutory conditions?—The condition, namely, that the full volume of light shall be seen ahead.

235–8. (*Mr. Ismay.*) You think there should be some control as to the patterns of lamps?—I think we ought to have sufficient statutory power. I think we ought to have what the Germans are proposing to have, namely, a regulation lamp and a requirement that lamps of the same pattern should be used on all ships. There are numerous other diagrams, and if the Committee wish any information in reference to them I shall be happy to give it. The next paper I have to put in is the Order in Council of January 30th, 1893.* Then there is a Minute which was issued to surveyors in January 1894, in consequence of the makers setting the wicks back in the lamp without altering the construction of the lamp. It is as follows: "It has been brought to the "notice of the Board of Trade that some side "lights are constructed in such a manner that the "portion of the lamp which extends from the inner "side of the lantern to the inner side of the lens is "of such width as to either partially or wholly to cover "the wick. To obviate this surveyors should see "that the lamp is so constructed as to enable the rays "from the inner edge of the wick to cut the outer "edge of the chock. The angle to which the light "is to be screened should be regulated by the chock, "which it would not be unless the foregoing instruc-"tion is complied with. If the centre of the wick "is, as suggested in the instructions, the centre of "curvature of the lens and of the reflector, and the "lens is the arc of a circle extending 120° from an "angle of two points abaft the beam, the difficulty "alluded to will never arise. (Signed.) Ingram B "Walker, 2nd January 1894."

* *See* Appendix 2, No. 7.

* *See* Appendix 2, No. 12.

## Wednesday, 3rd April 1895.

PRESENT:

THE RIGHT HON. SIR FRANCIS H. JEUNE IN THE CHAIR.

Rear-Admiral ANDOE.
Captain WILSON BARKER.
Mr. BOLAM.
Captain CASTLE.
Sir FRANCIS EVANS.
Sir EDWARD HARLAND.
Captain HUGHES HALLETT.
Mr. ISMAY.
Captain THOMSON.

Mr. C. HIPWOOD, *Secretary.*

Mr. PETER SAMSON called and examined.

*Mr. P. Samson.*

3 April 1895.

239. Will you tell me what you are by profession?—I am a Board of Trade Surveyor; I also hold the position of Principal Assistant to the Engineer Surveyor-in-Chief.

240. How long have you been in the service of the Board of Trade?—Fully 22 years.

241. Have you had any sea service?—Yes, about eight years in Her Majesty's Navy.

242. In what capacity?—As engineer.

243. When did you begin to take a special interest in ships' lights?—When I entered the service of the Board of Trade. I was then appointed an Inspector of Ships' Lights, and I still hold that appointment in addition to other appointments.

244. Have you had any special opportunities for acquiring a good knowledge of ships' lights?—Yes, I have had the ordinary experience of an Inspector of ships' lights, and in addition I have been associated, more or less, with most, if not all the light experiments made at Shoeburyness on behalf of the Board of Trade and the Admiralty since the year—I think it was 1876 when I witnessed the first set of experiments; I have also in the capacity of Principal Assistant to the Engineer Surveyor-in-Chief, had to advise the Board of Trade on questions which have cropped up from time to time relating to the construction of ships' lamps.

245. Are you familiar with what may be described as the literature of ships' lights?—Yes, I have a fair knowledge of the literature of the subject.

246. What inferences do you draw from the Regulations which have been issued from time to time?—That the screens used from 1848 to 1868 were plain boards or strips of canvas about 3 feet in length, placed parallel with the middle line of the vessel and secured at the inboard side of the lanthorn.

247. What evidence is there that such was the case?—In the early Regulations the screens were required to be made of wood or canvas, and I infer, from the fact of canvas being allowed, that chocks were not then invented; indeed chocks do not appear to have been used until the Board of Trade issued the Instructions to Surveyors regarding side lights in 1868. The screens shown in a House of Commons Return of 1851, No. 696, illustrate the manner in which some lights were found screened in 1849 by Captain Denham, an Inspector to the Board of Trade. They are straight, and placed on the inboard side of the lanthorn. Moreover, I have examined the builders' model of the "Himalaya," built in 1853, of the "Scotia," built in 1862, and of Her Majesty's ship "Northumber-" land," built in 1866, and the screens of all these models are without chocks, and placed along the inboard side of the lanthorn.

248. If the screens were arranged and placed as you believe them to have been, would the lights not show across the bow?—No, not across the bow of the vessel itself. The lights were carried on each bow, at least it was so in Her Majesty's ships in 1863, and I believe the screens were originally intended to prevent the lights from crossing each other abaft the stem of the vessel. The side-lights are still called bow lights at the Admiralty.

249. Do you think the framers of the Regulations intended the lights to cross ahead of the vessel?—I do. It is quite clear from the diagrams attached to the Regulations issued in 1848,* 1852, and 1858, that such was their intention, because they show vessels in certain positions, one being ahead of the other, and state that the vessel which is ahead will see the mast-head light and the red and green lights of the other vessel, and for these lights to be seen together the side lights must necessarily cross.

250. Is there any diagram? We have got the copy of instructions?—Yes.

251. (*Mr. Bolam.*) Diagrams were referred to in Mr. Howell's evidence. They are the earliest, I think?—These are copies of the diagrams issued with the 1858 Regulations.

252. Were you referring to the 1858 or the 1848 instructions?—The 1858.†

253. (*Chairman.*) What I understand you mean is this, that the diagrams and the instructions show vessels approaching literally end on, so that in daylight their masts would be seen in line, and they are supposed, under those circumstances, each to see both the green and the red light of the other?—Quite so.

254. (*Mr. Bolam.*) May I ask if you are referring to the Regulations of 1848 or 1858, because we have both?—These diagrams were issued with the 1858 Regulations.

255. (*Captain Wilson Barker.*) But there are instructions in 1848?—Yes, the Admiralty added a note to the Regulations of 1848 to the effect that diagrams illustrative of the best plan, of placing side-lights, and instructions as to the proper mode of fitting lights on board steam vessels would be furnished to parties applying for them. These diagrams were published in the London Gazette of March 2nd, 1858, with the Regulations of 1858.

256. Can we not have these diagrams?—I can show you copies of them.

257. (*Chairman.*) You were good enough to produce a diagram issued with the Admiralty Regulations in 1847?—Yes, they were first issued with an Admiralty paper of 1847, which is printed in Return No. 696 of 1851.

258. I see that it is contemplated that two coloured lights would be seen by vessels directly approaching one another?—Quite so.

259. And that the two coloured lights being visible to each other would indicate their direct approach towards each other?—Yes.

260. "In this situation it ought to be a Standing "Rule that both should put their helms to port. This

* See Appendix 1, No. 1.

† The diagrams issued with the Admiralty Regulations of 1848 and 1858 were similar to those in Appendix 1, No. 1. The diagrams in that Appendix are taken from an Admiralty paper of 1847, printed in H. C. Return, 1851.

*Mr. P. Samson.*

3 April 1895.

"rule is already pretty generally adopted; but it would "add to safety if it were made imperative; for it is "evident that without some rule of this kind, well "understood and practised, it will be impossible to "guard at all times against accidents in the situation of "the two vessels here given." Then there is a diagram which shows the two vessels "end on" to one another and each vessel is supposed to see the green and red lights of the other?—Yes. May I call attention to the word screen in the page opposite to the Admiralty letter. There is a reference there to a canvas screen.

261. (*Chairman.*) I see. In the instructions of 1847 what is said is, "the manner of fixing the "coloured lights should be particularly attended to. "They would require to be fitted, each, with a screen "of wood or canvass on the inboard side in order to "prevent both being seen at the same moment from "any direction but that of right ahead. This is im- "portant, for without the screen (a principle first "introduced with this plan), any plan of bow lights "would be ineffective as a means of indicating the "direction of steering"?—Yes.

262. (*Mr. Bolam.*) So that the words "seen "from any point of view to right ahead" have been changed in the present Regulations to "seen "across the bow." The words originally were, "right ahead," and that has later come to "across "the bow." Can you tell us when the change in the phraseology took place?—I have not a copy of the text of the 1847 Regulations as originally framed, but the Regulations gazetted in 1848 contain the following provision: "The side-lights to be moreover, fitted with "inboard screens of at least 3 feet long to prevent "them from being seen across the bow. The screens "to be placed in a fore and aft line with the inner "edge of the side-lights." Again, in the Regulations of 1852 that provision appears in a somewhat modified form, and reads as follows: "The side-lights are "moreover to be fitted with screens on the inboard "side of at least 3 feet long to prevent the lights "from being seen across the bow" and in the 1858 Regulations it reads "The side-lights are to be fitted "with inboard screens projecting at least 3 feet "forward from the light so as to prevent the light "from being seen across the bow."

No further changes of importance appear to have been made in the provision referred to since 1858. Then to continue my answer to a previous question I may say that the Regulations require the lights to be of uniform brilliancy from right ahead to two points abaft the beam, and it is impossible to make such lights as have come under my observation fulfil this condition, except by screening them in such a manner as to permit of some of the rays falling across the vessel's path.

263. (*Chairman.*) Is it possible to screen lights so as to produce a dark lane forward of the vessel, and still retain the uniformity of the light from right ahead to two points about the beam?—No; to produce a dark lane the light would have to be completely masked when viewed from ahead, and the effect of this would be to destroy its uniformity. I have dealt with the matter fully in a letter to Sir Digby Murray, a copy of which has, I think, been handed in.*

264. What is the minimum angle to which lights require to be screened to ensure the condition as to uniformity being complied with?—The minimum angle should be such that the full light will be seen ahead at a reasonable distance from the vessel.

265. What would you regard as a reasonable distance?—That would depend on the state of the weather; but as collisions are more likely to occur in thick than in fine weather it should be as near the stem of the vessel as the other conditions will admit.

266. What are the other conditions to which you have alluded?—The width of wick necessary to give the required volume of light, and the undesirability of making the field in which both lights are seen broader than is necessary.

267. What is the width of field which you consider necessary?—That which is found by screening the lights to 4 degrees.

268. Why do you select 4 degrees?—Because it admits of the full light being seen ahead at a reasonable distance from the vessel, and it also admits of the well-known and useful rule, "Green-to-green, and "Red-to-red, perfect safety, go ahead," being adopted without incurring serious risk of collision. I hand in a table* showing that when the side-lights are 60 feet apart, and screened to 4 degrees, the half breadth of the field in which both lights are seen is only 390 feet at a distance of one mile. Consequently, if two large vessels one mile apart were meeting on parallel courses, and happened to be just outside each other's field, they would fall under the "Green-to-green or Red-to-red" rule, and pass each other at a distance considerably less than their own length apart, and that would, I think, be regarded as a close shave, more especially if one or both of the vessels were square-rigged.

269. Were you speaking of the statute mile or the sea mile?—The sea mile; but in order to shorten the calculations I have taken the sea mile at 6,000 instead of 6,076½ ft.

270. Are the half-breadths given in the table actual measurements?—No. They are found by calculating the distance between two straight lines cutting the outer edge of the chock and the outer edge of the wick of the red and the green lights respectively, these lines being one mile in length.

271. Do the actual distances practically agree with these calculated distances?—Yes,† a copy of the report regarding experiments made by the Superintendent of Experiments at Shoeburyness on behalf of a recent Committee on the Rule of the Road at Sea confirms this statement. That report has, I think, been handed in.‡

272. Are the actual greater or less than the calculated distances?—Less, except at very short distances from the lights.

273. Would these distances have been still less if the lights had not been in all respects in first class condition?—Certainly.

274. How do the actual compare with the calculated distances when the measurements are taken near the lights?—They are generally greater, but there may be defects in the lights which would cause them to be less.

275. Why should they generally be greater?—Because at short distances from the lights, the reflected, or what may be termed the scattered light, is sufficiently strong to be seen.

276. Does the width of the field at these short distances depend on the position of the flame relatively to the screen and chock?—No, it increases with the radius of the lens, and with the illuminating power of the flame.

277. Were the red and green lights which you have seen tested at Shoeburyness distinctly visible at a distance of two miles (12,000 feet)?—No, not to the naked eye. They could be seen through field glasses, but even then they would have been difficult to pick up had there not been white lights near, by which they could be located.

278. Were all these lights in first class condition as regards polish of reflector and lens, trimming of wick, &c., and was the atmosphere favourable for long-distance observation?—Yes.

279. If the weather had been thick, or if the lights had not been in first class condition do you think they would have been visible at two miles?—No, not even with the aid of field glasses.

280. Apart from the necessity of making the lights cross to ensure the degree of uniformity required by the Regulations, do you consider the crossing of the lights at a small angle a desirable or undesirable feature?—I regard it as a most desirable feature.

* *See* Appendix 2, No. 14.

* *See* Appendix 3, No. 1. † *See* Appendix 3, No. 3.
‡ *See* Appendix 2, No. 11.

281. Why?—Because when a vessel gets within the field of mingled rays of another vessel, those on board of her know at once that they are within a few degrees of the other vessel's path, and if the weather is thick they know that their vessel is in a position of great danger, for the vessels would then be very near each other, and the field of mingled rays at short distances is very narrow. In short, the mingled rays of a vessel's side-lights indicate to a vessel ahead, or nearly ahead, the direction in which she is steering, and this is information of a most valuable kind. The field of mingled rays also tend to prevent a vessel right ahead, or nearly ahead, from seeing the red and green lights alternately, owing to the vessel carrying these lights yawing; and this, of itself, is, I think, an excellent feature, because if, owing to yawing, one of two vessels, meeting end on, or nearly end on, showed her green light without the red light, even for a few seconds, those seeing it might reasonably assume, if the vessels were near each other, that the course of the vessel showing the green light had been altered, and thus be led to put the helm the wrong way, and cause the collision which they were anxious to avoid.

282. It is a fact, is it not, that from 1869 to 1892 the lights were screened in such a manner that a line drawn parallel with the middle line of the vessel, and cutting the outer edge of the chock, or its equivalent, should also cut the inner edge of the lens?—Yes.

283. To what angle were the lights then screened?—The angle varied considerably. From my own observations it varied from about 1° to 6°, the average being between 4° and 5°.

284. What was the cause of this great variation in the angle?—It was caused by the wicks being placed at unequal distances from the line cutting the outer edge of the chock and the inner edge of the lens.

285. Who fixed that distance?—The lamp makers; and the Board of Trade Surveyor did not object if the lamp complied with his instructions and his interpretation of the Regulations for preventing collisions at sea.

286. Can you explain why the distance varied?—Yes. Some lamps required the wicks to be placed farther than others from the line cutting the outer edge of the chock, and the inner edge of the lens (line of reference) in order that the light might be seen two points abaft the beam; and another feature, which no doubt tended in many instances to cause the wicks to be placed at the greater distance from the line of reference, was the dirty condition of the outer edge of the lenses of many lamps after being in use some time.

287. But if the lenses had been properly placed and had subtended an angle of 112½ degrees or 10 points, would the angle of screening not have been less than 4 degrees, provided the centre of the wick had in each case coincided with the centre of curvature of the lens?—Yes, but the full light would not have been visible from ahead, and if the lenses happened to have a border of dirt along the housing as many lamps have, little or perhaps none of the light would have been seen ahead.

288. To what angle would the lights have been screened, assuming the lenses to have been clean?—From nothing to 1° 22′, the magnitude of the angle depending on the position of the wick. For instance, if the wicks had been placed parallel with the side of the screen as in the sketch I have here the angle would have been practically nothing, and would have been nothing had the slightest error been made in fitting the screens. On the other hand, if the wicks, (assuming them to have been the broadest now used —1¾ inches) had been placed as shewn in this other figure, that is, vertical to the side of the screen, the angle would have been 1° 22′, and one half of the light would have been completely masked by the chock when viewed from ahead.

289. Would such lights in your opinion have complied with the Regulations?—No.

290. How could they have been made to comply with the Regulations?—By increasing the angular measurement of the lenses, or by placing the wicks between the centres of curvature of the lenses and the lenses themselves.

291. Was the latter alternative the one adopted by the lamp makers?—Yes.

292. Which in your judgment was the better alternative?—The former.

293. (*Sir Edward Harland.*) What was the former?—Increasing the angular measurement of the lenses.

294. (*Chairman.*) You know that sailors take an objection to what they call squinting lights, because they say that a vessel under such circumstances would really have the other vessel on her starboard bow, and yet would see the two lights and have to port, and they think that a condition of danger, or it is suggested it is a condition of danger. What is your view about it?—Provided the angle is sufficiently small I do not see any danger in it at all, in fact I think the crossing of lights a very excellent feature, for the reason I have stated.

295. Of course Article 15 provides that a vessel is only to port when she is end on or nearly end on?—Ahead, or nearly ahead.

296. When she is end on or nearly end on, that is the phrase, and she is end on or nearly end on when she sees both lights. That is the view of Article 15. But, of course, if lights cross, it would become obligatory, would it not, on a vessel to port, even though in point of fact two vessels, if they continued their course, would not meet?—That would be so, unless the conditions were such as to justify the use of the starboard helm, but if the lights did not cross and the commanders of the vessels acted on the "green-to-green and red-to-red" rule the vessels might be so close as to collide.

297. I suppose you would say a vessel would only see another vessel's red and green lights when she was, if not end on, nearly end on?—Quite so.

298. So you would say there was no violation of Article 15 in requiring a vessel to port when she sees both side-lights of an approaching vessel?—Yes, I should say there was no violation of Article 15. I think the term "right ahead," should have a wider meaning than that generally given to it, because vessels have considerable breadth.

299. You mean that when it is said that the lights are to show right ahead, you think that ought to be regarded as right ahead of the breadth of the ship, and not merely right ahead of the lamp?—I certainly think it should extend further on each side of the vessel than right ahead—that is right in front of the stem, because two vessels, especially square-rigged vessels, meeting on parallel courses would collide even if their courses lay considerably more than the vessel's width apart.

300. So that vessels, green-to-green and red-to-red might collide from that point of view?—Quite so.

301. I mean if the lights do not cross at all?—If the lights did not cross at all, there is no doubt that these vessels would collide.

302. Some question arose about the meaning of the words "across the bow." You would not, as I understand it, think it desirable to limit that in such a way as to place it merely across the actual bow or stem of the vessel. You would not think it desirable that lights should cross anywhere about there?—Not at all, although I thoroughly believe that the screens were originally fitted for the purpose of preventing the lights from crossing at or about that point.

303. You think the original rules may only have been intended to prevent the two lights being seen actually across the stem of the vessel?—Quite so, across the vessel itself.

304. Across the bow is hardly the phrase in nautical language which would be used to express the actual stem of the vessel?—No. But I still think the screens were originally fitted to prevent the lights from crossing at or abuft the stem. We have very little idea of what kind of lamps were used in 1847, *i.e.*, at the time the original Regulations were framed. I do not suppose they were lights such as

*Mr. P. Samson.*

3 April 1895.

are used at the present time. It is just as likely as not that they were square lamps, which, if unscreened, would have shown across the forecastle of the ship.

305. Of course if your conjecture is right, that originally these lamps were placed right in the bow very close to one another, then these problems would not really arise—the lamp would be seen ahead for example in that case even though the rays did not cross?—That would depend entirely on the distance between the lights.

306. Supposing the vessel's lights were placed so close to the bow of the vessel that there were only 5 or 6 feet between them?—I do not suppose they were ever placed in a position of that kind.

307. I suppose vessels during the last 50 years have increased considerably in size?—Yes.

308. (*Mr. Ismay.*) In the case of paddle-boats they used to place the lights on the paddle-box?—Yes.

309. Lights were then more used in the coasting trade than in seagoing vessels?—Those Regulations appear to have been adopted first by the Admiralty for their own ships, and then applied to merchant vessels. I think they say so in the early Regulations.

310. And chiefly in paddle steamers in those days?—Yes, but I do not know that the lights were carried on the paddle-boxes of H.M. ships. I should like to draw attention to a letter of Captain Denham's on this subject. It is in parliamentary paper 696 of 1851. He refers to the lights carried in merchant paddle vessels, and calls attention to the objectionable practice of placing them on the paddle-boxes. He also gives a diagram showing a light placed on the sponson where it could not possibly show two points abaft the beam.

311–12. (*Chairman.*) Do you happen to know whether lamps were ever carried abaft the beam of the vessel?—I have seen them carried almost abreast the mizen rigging in sailing vessels, in fact, carried in all sorts of places in some of the small vessels. I know the Board of Trade have for many years been endeavouring to get lights carried further forward.

313. What is the smallest angle which, in your judgment, would enable the lights practically—I do not speak in theory—but practically, what, in your judgment, is the smallest angle which would allow the full volume of the light fairly to be seen ahead; would two degrees do it?—I think not; a larger angle than that is required. It is difficult to answer the question, because a great deal depends on the width of the wick. There is great variety in the width of the wicks; they vary from two inches to three-quarters of an inch, and to get the full volume of the light from the broad wicks you require a larger angle. If all the lamps had powerful narrow wicks the angle could be reduced somewhat, but to cover all cases, I do not think you could do better than adopt the four-degree angle.

314. How do you manage in regard to the electric light?—We take the outside of the wire instead of the outside of the wick.

315. (*Mr. Bolam.*) What is the usual diameter of the filament from the outside to the inside in the incandescent?—I am not prepared to say exactly, but the loops are generally from about seven-eighths to one inch in diameter.

316. They use specially made lamps in some cases, do they not?—I have not seen them; I know they have special lamps for photographic purposes.

317. I am meaning with regard to the diameter of the filament?—Quite so, the loop of the filament is much narrower in the lights used for photographic purposes.

318. (*Mr. Ismay.*) In narrow waters, with a strong tide running and a long ship coming up, does the finer screen not give an advantage over the broader screen?—No, I think not.

319. Has not an approaching ship to give more helm under a system of broad screening than under a system of fine screening?—I am not familiar with any waters in which the four-degree screening would be at all a disadvantage, but if there be such a channel frequented by shipping, those in command of the vessel using it would, I think, be guided by Article 21 of the Regulations, and would consequently keep to the side of the fairway lying on the starboard side of their vessels. The four-degree screening only amounts to this: at a distance of two miles from the vessel half the width of the field in which both lights are seen is only about one and a third times the length of the s.s. "Campania." That is all it amounts to, and at that distance, viz., two miles, you cannot see the lights with the naked eye unless they are exceptionally good ones and the weather is exceptionally favourable. I wish you gentlemen could see some experiments at Shoeburyness; they are really very instructive.

320. Why do these pilots and others take such exception to the four degrees?—Well I think the pilots had no idea that the lights crossed at all until the last revision of the instructions to surveyors was issued. That, I think, is why they took exception to it. They might have to give the ship more helm in the case of broader screening than with the narrower screening, but at most it would be a mere trifle, and in practice it would, I believe, not amount to anything.

321. Then if it is so little why do you alter them?—To insure uniformity.

322. But if there is so little when ships are screened at two degrees why alter them to four degrees?—We have reduced the angle in many cases instead of increasing it.

323. In some cases you have increased it?—Yes, but on the whole we have reduced the angle.

## Thursday, 4th April 1895.

PRESENT:

THE RIGHT HON. SIR FRANCIS H. JEUNE IN THE CHAIR.

Rear-Admiral ANDOE.
Captain WILSON BARKER.
Mr. BOLAM.
Captain CASTLE.
Sir FRANCIS EVANS.
Sir EDWARD HARLAND.
Captain HUGHES HALLETT.
Mr. ISMAY.
Mr. SCRUTTON.
Captain THOMSON.

Mr. C. HIPWOOD, *Secretary*.

Mr. PETER SAMSON recalled and further examined.

*Mr. P. Samson.*

4 April 1895.

324. (*Chairman.*) Can you tell me what is the practical variation in the breadth of the wicks of lamps as you find them in practice?—They vary considerably.

325. I wanted to know what the variations were?—They vary from 2 inches down to $\frac{3}{4}$ inch. There are very few $\frac{3}{4}$ inch wicks, and the 2 inch ones are getting rather rare.

326. So that they are practically getting down to something like an inch?—Yes; an inch and an inch and a quarter in some of the larger lamps that are being made for burning paraffin. If they use colza a very much larger wick is required, in fact, I believe that inch and three-quarters is rather little.

327. For practical purposes may one take it that an inch to an inch and a quarter in your judgment gives sufficient light?—With paraffin, certainly, the lamp being of a good make.

328. In your judgment that is sufficient wick?—Yes. That is sufficient wick if the lamp is a good one.

329. I mean supposing it was desirable—I do not know whether it is or not, we shall see as to that—to prescribe a breadth for the wick of a lamp in reference to screening. Supposing it was right to prescribe a breadth for the wick, do you think an inch to an inch and a quarter would be a safe and proper limit for it?—I think a very good lamp could be made with a wick of that size, but I do not mean by that that all lamps would show the required distance with that width of wick.

330. But good lamps would?—Good paraffin lamps would, if provided with chimneys.

331. Now I should like to know what is the limit within which the lamps show their full light?—Abaft the beam it varies from about half a point to a point, according to the width of the wick, and ahead it varies from about $1\frac{3}{8}$ degrees to $3\frac{1}{8}$ degrees, in cases where the inner edge of the wick is in line with the outer edge of the chock.

332. I am afraid for the moment I do not quite follow that. I do not quite see why it is different ahead from abaft the beam. You say that abaft the beam it might exceed the proper distance as much as a point?—Yes, quite so.

333. Why does it not exceed the distance ahead as much as a point?—Owing to the screen and to the position of the wick it shows differently. If you will allow me I will hand in a diagram here that fairly represents some of the lamps made prior to 1892. It is not made from an actual lamp, but it fairly represents many lamps that were made prior to the date named.

334. You say, "This diagram fairly represents "some of the port side lights that were made prior to "1892, except as regards the reflector, which is of "the pattern recommended in the present instructions "to surveyors. It also shows wicks 1 inch, $1\frac{3}{4}$ inches, "and 2 inches wide respectively, and the changes "which the alterations in the size and position of the "wicks produce, the screen, 3 feet long, being parallel "with the keel, and its outer face in line with the "inner edge of the lens." And you give the angle of screening with 1 inch wick, 3° 53′; $1\frac{3}{4}$ inch wick, 4° 23′; 2 inch wick, 4° 40′. Now let me understand this. The wicks are placed parallel to the chord of the arc. Will the light show past the housing of the lamp?—Yes.

335–6. You think it would exceed two points abaft the beam by very nearly a point?—Yes.

337. Now I want to see how the two rules relate to one another. First, the rule to show an unbroken and uniform light 10 points, and then to see what is the effect upon that of the subsequent rule as to screening. I want to start with this: What is the effect of a lamp, supposing no screening is used?—That lamp would show considerably over 10 points.

338. You say that a lamp made in this way would not comply strictly with the rule as to the two points abaft the beam, but would give an extra point or so?—Yes.

339. What would be the effect in the direction ahead of the ship?—The effect would be enormous in this particular case.

340. And enormous in almost any lamp you could make?—Yes, unless the lens could be shifted round.

341–2. You could so shift the lens as to practically effect something like the operation of screening?—Quite so.

343. Supposing there was no rule as to screening, do you think a lamp could be made to show an uniform and unbroken light over 10 points and no more?—No, I think there is no possibility of that.

344. No possibility that the light shall be uniform and unbroken?—Quite so.

345. I should like to understand how that is. Suppose you had a lens coming to the inner edge of the wick?—In that case the width of the wick would equal the tangent of the angle which the light would show across the bow.

346. Then there would be an uniform and unbroken light over more than 10 points if the inner edge of the lens were in line with the inner edge of the wick?—If the inner edge of the lens were brought in line with the inner edge of the wick then that lamp would show an unbroken light over 10 points of the compass, but it would show considerably more.

347. So it would not show an unbroken light?—It would show an unbroken light over the 10 points, but it would show considerably more than the 10 points.

348. It would show an uniform and unbroken light over the 10 points, and something more, but fainter over a larger area?—Yes, quite so.

349. The same abaft the beam?—Yes.

350. Would it apply, too, before the beam as well as abaft the beam?—Anywhere before the beam you would have an uniform light.

351. Supposing that we had the solid material of the lamp brought up to the inner edge of the wick, then the effect would be, in theory, at any rate, that the volume of unbroken light would be thrown ahead; but, as you say, there would be side rays which would cross ahead of the ship?—Yes.

*Mr. P. Samson.*

4 April 1895.

352. It would be possible in the same way, would it not, so to regulate the length of the lens that the uniform light would show two points abaft the beam and no more?—Quite so.

353. (*Mr. Ismay.*) Would you get the full 10 points?—You would get the light uniform for the 10 points, and a diminishing light beyond that until it vanished altogether.

354. (*Rear-Admiral Andoe.*) The object of the screen is then to regulate these diminishing rays?—Yes. Of course it would be very undesirable to make lamps of the kind you are considering, because, as I have already stated, many lamps have as much as half an inch of thick dirt near the housings, which of course would cut off an enormous amount of the light.

355. (*Captain Thomson.*) In the direction abaft the beam?—In both directions.

356. (*Chairman.*) If the effect could be produced by the mere construction of the lamp, why do you think the provision was added about the screen?—Let it be assumed that we have the ideal lamp we have been picturing. Well, if it have a wick which stands out an inch from this line (line of reference) the rays from the outer edge of the wick would show across the bow of the ship at an enormous angle owing to the radius of the lens being small, and to reduce that angle you fit a screen with a chock.

357. (*Captain Thomson.*) You need not have that angle?—We are speaking of this ideal lamp.

358. (*Chairman.*) I want to know with what object it is to be supposed the person who drew these rules added the regulation as to screening. If one found that everything could be done by means of the lamp, one does not see why they added the screen. The suggestion is that the screen was added to prevent the rays from the outside of the wick crossing at too great an angle. That, you think, was the motive of it?—Yes.

359. And then, of course, there is the suggestion that in a lens of that comparatively small size you run considerable risk of the edge of the lens getting dirty?—Quite so, and in the early days I am not at all sure that they had lamps of this particular kind.

360. No, I suppose not?—In the Parliamentary Paper I referred to yesterday, No. 696 of 1851, some square lights are shown, with flat glass in front and at the side. The Board of Trade inspector in the same paper complained of the lights then used.

361. (*Captain Thomson.*) Would a lamp be considered in good order if it had a line of dirt on the lens?—No.

362. (*Chairman.*) I suppose if a lamp is exposed for a considerable time to the sea it gets more or less encrusted?—Yes, with salt; but they get dirty from neglect. The men rub the main part of the lens and leave the corners uncleaned.

363. That is no fault of the lamp?—Oh, no.

364. (*Rear-Admiral Andoe.*) You could not then construct a lamp that would efficiently cut off the rays of light at a desired angle without using a screen?—No, not at all.

365. Because the side of the lamp is so short?—Quite so. Those who framed the rules were not very particular as to the terms they used. For instance, they laid down a regulation that an anchor light was to be carried, which was to show an uniform light all round the horizon, although they must have known that the funnels and masts of steamers would cut off large portions of it.

366. (*Chairman.*) But still the Regulation as to screening itself is obviously a very rough one?—No doubt.

367. Because, although it prescribes the length of the screen, it nowhere prescribes whether it is to be parallel to the keel or not, nor does it prescribe the distance from the lamp?—Quite so.

368. Both of which things make a considerable distance?—Yes; as you will see from the diagrams in the early editions of the Board of Trade Instructions to Surveyors. It is perfectly clear from the diagrams that the screens, fitted prior to 1868, were simply plain boards put along the inboard side of the lanthorn.

369. Plain boards or even canvas?—Yes.

370. (*Rear-Admiral Andoe.*) In your evidence I think you stated that the rays should cross the bows as near as possible?—The rays from the inner edge of the wick should cross at a reasonable distance from the stem. In order that each light may be uniform throughout the 10 points of the compass, that is from right ahead of the stem (not ahead of the light) to two points abaft the beam.

371. Therefore the light, that is, the inner rays, should cross as near the stem as possible?—I do not mean anything within the eighth part of a mile in the case of a large vessel; when a ship gets so close that a collision is inevitable the position of the crossing point of the inner rays is a matter of no importance.

372. But I think you said that the side lights ought to be fitted so that their converging rays should cross as near to the bows as possible?—Yes, I said so; but when the angle at which the rays from the outer edges of the wicks cross is fixed, the distance from the stem at which the rays from the inner edges of the wicks cross varies with the distance between the lights as well as with the width of the wicks.

373. Well, in the instructions to surveyors of 1868 it is said that the two points to be studied in fixing and arranging the inboard screen appear to be, first, to ensure that the rays of the red and green side-lights do not cross each other immediately on leaving the ship, nor at all, more than is possible?—Yes. That instruction refers to the rays from the outer edges of the wicks.

374. It does not say so in the instructions?—That is what is understood. If you will allow me, I will hand in four tables,* showing the distances from the lights at which the rays from the inner edges of the wicks cross, the width of the wicks varying from $\frac{3}{4}$ inch to $1\frac{3}{4}$ inches, and the distance between the lights varying from 20 to 70 feet.

375. In the case of the lights crossing near the stem of the ship there would be no dark lane at all?—None whatever.

376. (*Chairman.*) Take the case indicated in this table?—In this particular case the inner rays do not cross at all, because the inner edges of the wicks are masked by the chocks.

377. With what angles of screening does this take place?—With the 1 degree screening.

378. All this is screened to 1 degree?—Yes. In this case the rays do not cross.

379. You mean they do not cross the projected line of the keel?—Quite so.

380. (*Rear-Admiral Andoe.*) Do you mean that no rays cross at all?—No. The outer rays cross.

381. (*Chairman.*) But not the full light?—Not the full light.

382. So that if you screen to 1 degree the rays from the inner edge at a mile are 31 feet away of the centre line?—Quite so.

383. In other words, the dark lane at that point is 62 feet broad?—Yes, if it can be called a dark lane.

384. (*Rear-Admiral Andoe.*) It is not absolutely a dark lane, because you get certain rays from the outer edge of the wick?—Quite so.

385. (*Chairman.*) With lights screened to 1 degree, you do not get an unbroken light straight ahead of the stem of the ship?—You cannot get it.

386. (*Rear-Admiral Andoe.*) Mr. Samson, you seem to ignore all rays except those from the inner edge?—No; my object in preparing this table was to show the effect of the screening on the rays issuing from the inner edges of the wicks. That is all.

387. (*Chairman.*) Now, taking lights screened to 2 degrees, the unbroken light in the strictest sense shows straight ahead of the vessel?—Yes, at that point. In that particular case you would see the full light on the middle line, at three-quarters of a mile from the stem.

* *See* Appendix 3 No. 2.

388. (*Rear-Admiral Andoe.*) How far off would the modified rays cross?—You will see that from the other table I have handed in.

389. That is the important point, that the light should cross close to the stem?—Yes.

390. Lights screened to 2 degrees do, for practical purposes, show an unbroken light straight ahead of the keel of the vessel?—No. When you come down *here* where the wicks are 1¼ inches wide the rays from the inner edges of the wicks do not cross at all; there is a sort of darkened lane in that case. You see the figures are uniform throughout.

391–7. So when you screen to 3 degrees, or even to 4 degrees, you do not in every case by any means show an unbroken light straight ahead of the vessel?—That is so, except at considerable distances from the vessel.

398. Even 4 degrees does not give you an unbroken light straight ahead of the vessel everywhere?—No. But with narrow wicks screened to 4°, the rays from their inner edges cross at a reasonable distance from the vessels. That was what I meant by saying the rays from the inner edge of the wicks should cross near the ship.

399. Yet it says in the instructions to surveyors, if they see the lights cross each other they should of course have the defect remedied?—That is not in our present instructions; that is in some old copy. At the same time you will find directions as to the screening of the light; it is stated that the inner face of the screen must be in line, or should be in line with the inner edge of the lens.

400. You are speaking of the inner edge of the lens?—Yes, it was required to be in line with the face of the screen or the outer edge of the chock.

401. According to your experience has it been always the case that the lights are so placed and screened as to be able to be seen across the bow of the ship?—That has always been the practice.

402. Always been the practice?—Yes.

403. About what distance ahead of the ship do you think, from your practical observation?—It varies with the size of the ship.

404. Have you noticed in American liners, is it very close to the bow or is it 100 yards or 200 yards, roughly?—Well, when the lights were screened to about 4 degrees the lights crossed at between seven and eight times the distance between the lights.

405. Is it possible to check these screens by actual observation of the lamps?—It is not convenient to do that in the merchant service.

406. Do you trust entirely to placing them?—Yes, to measurement.

407. And they are not tested as a matter of practice?—Not as a rule.

408. (*Chairman.*) The practical difficulty of getting a mile ahead of the ship would be very great?—Yes, there would be a difficulty in getting the ship into a proper position.

409. That is the reason why it is important to have a definite rule, if possible, as to the angle to which they should be screened?—I think the fixing of the angle a very excellent feature.

410. (*Rear-Admiral Andoe.*) Was it to ensure that the angle should be uniform and not excessive that the Board of Trade fixed it at 4 degrees?—That was so, and after the angle was fixed we found that it was less than the average angle at which the lights had previously been screened.

411. So that really in defining it as 4 degrees, no new practice has been adopted, except to limit the range?—Not at all.

412. Is that right?—That is so.

413. (*Sir Edward Harland.*) You do not know when what were called bow lights were put in vessels in the early days?—No.

414. Now with reference to the distance at which the lines of light crossed each other in, say, 1848, when the rules were first introduced. What do you think was the distance ahead of the ship at which the respective rays from the two lights really did cross each other—if they did cross each other at all?—In the case of paddle vessels the lights must have crossed just under the bowsprit—that is close to the stem.

415. So that, practically speaking, there might have been cases where the lights did actually cross the stem of the ship?—Yes, when the lights were not carried on the bows of the vessel it is highly probable that in many cases they crossed abaft the stem.

416. Was there ever a time when the lights were fitted without screens; is there anything in the history of side lights showing that there were lights without screens?—I have not seen any record of anything of that kind.

417. (*Chairman.*) The Admiralty paper of 1847 said screening was first provided for by those Regulations?—The first Regulations issued by the Admiralty contained the provision as to screening.

418. (*Mr. Ismay.*) Was there not a time when the side of the ship was used as a screen for the lights, and answered all the purpose?—I have not seen any record of it.

419. It was the fact?—Yes, that is doubtless so, for I have seen a modification of it in Her Majesty's Navy. I have myself seen some ships with the screens worked out of the bulwark rails.

420. (*Rear-Admiral Andoe.*) Recessed expressly?—Yes.

421. (*Sir Edward Harland.*) Assuming, then, that this screen, in the early days, was simply a plain straight screen that was placed parallel with the keel, without chocks at the forward end, and taking the ordinary class of side light which was in use at that time, what would you say was the angle at which the light from the two lamps crossed, at what angle did they cross the bow?—I do not quite follow.

422. First, may I ask about what date were chocks first introduced?—I believe about 1868 or 1869.

423. Before chocks were introduced at what angle do you think the lights actually crossed the bow?—About 9 or 10 degrees.

424. Then for years the rays actually crossed the bow at an angle of 9 or 10 degrees?—Quite so.

425. Can you give us any idea as to the reason for placing chocks at the end of the screens?—No doubt it was with the object of reducing the angle.

426. To what?—That was not stated.

427. Then what was to guide the surveyor in each port? First he was told that the original screening was unsatisfactory, and he was told to put a chock there; had he nothing whatever to guide him as to the breadth of chock which was to be fitted in each case?—The breadth of the chock was to equal the distance from the outboard side of the screen to the inner edge of the lens.

428. Was the position of the lens referred to in these early instructions; the position of the lens varies enormously, even in the drawings laid on the table?—These early instructions were no doubt imperfect in that and other respects.

429. Measurement is not now taken from the lens?—Measurement from the lens as affecting the screening has been abandoned in the present instructions.

430. Here is the drawing of the lamp. The distance from the inner edge of the lamp is so much. When we turn to this other drawing we find that the one lens has all that much of difference [*measuring on the drawing*]?—Yes.

431. (*Captain Hallett.*) Are those drawings the same scale?—The one I handed in is a full-size drawing.

432. (*Sir Edward Harland.*) Now, here is this other drawing. This lamp, although a larger lamp, shows so much. Now, here is a smaller lamp, which shows so much more; would you advise the Committee not to receive or treat any of these lens drawings with any degree of confidence?—What I think should be done is to make the lens subtend an angle of about 130 degrees, and fix its after end so as to show two points abaft the beam. All the surplus lens would then fall towards the inner side of the

*Mr. P. Samson.*

4 April 1895.

lanthorn. By that means you would get rid, to a great extent, of the bad effects of the border of dirt that is frequently found on the lenses.

433. (*Captain Hallett.*) But you must alter your line of reference—your line of reference is a reference to the inner edge of the lens?—That is all right now. I am speaking of the new instructions. We have had some difficulty in getting lenses with 130 degrees, but what is wanted is to carry that lens round another inch *there*, and trust entirely to the chock for the screening.

434. (*Rear-Admiral Andoe.*) Then you would regulate the chock by the wick?—Yes. The only object in fixing the end of the lens in this position is that it saves us putting a screen and chock *there* to prevent the light from being seen more than two points abaft the beam. If we carried the lens to *here* we should have to put a screen and chock *there*.

435–6. (*Sir Edward Harland.*) The light shown abaft the beam varies according to the angle which the two edges of the wick make with the after edge of the lens?—Quite so. If the lamp is constructed so that the centre of the wick lies in this line, *i.e.*, the line drawn from the centre of curvature of the lens to two points abaft the beam, then it would show beyond the two points.

437. Well, your opinion is, it would be well to conform, as far as we can, to the two points abaft the beam, but that by reason of their being no screen at the after end of the lamp the light shown abaft the beam varies considerably from no other consideration than that the lamp must have a wick?—Yes.

438. Then while we may go to refinements, and perhaps necessary refinements, in the direction of the light forward, you think that the Committee need not trouble itself with anything like a refinement with reference to the two points abaft the beam?—Having in view the Regulation requirements it is, I think, desirable to have the lights showing not more than two points abaft the beam, but otherwise a greater angle would not, I think, be objectionable provided all lamps were alike in this respect. I should like to take the power of fixing the position of the wicks out of the lampmakers' hands, and to be able to say to them that the wicks must be placed in a certain position.

439. Would you advise that the lights should be shown most powerfully ahead?—Yes.

440. Then to obtain it in the most perfect way, would you recommend placing the wick at right angles to the keel?—Yes.

441–2. That is to say, make the light from the two sides of that wick less varied?—Quite so.

443. That is to say, if you place the wick vertical to the screen, then you get the greatest light forward, and it reduces the difference produced by the width of the wick to very moderate limits?—Yes.

444. You can place the wick so that it will just cover the two points abaft the beam?—If you placed the wick exactly in that position the light would be liable to be masked by the dirt on the lens.

445. It would make the angle too precise?—Yes.

446. You would rather recommend placing the wick athwart ship?—Athwart ship gets over that difficulty, and we get a better light forward.

447. (*Chairman.*) What rule would you lay down as to the position of the wick in regard to the lens?—I would make the centre of the wick coincide with the centre of curvature of the lens, and place the wick at right angles to the screen, the screen being parallel to the middle line of the vessel.

448. (*Mr. Ismay.*) Do you think it would be desirable that the Board of Trade should have the power of seeing it was always done)—Yes.

449. (*Sir Edward Harland.*) Referring to the question of lenses, is it your experience that they magnify or reduce the rays of light?—We have passed many lamps with what we call "fish globe" lenses. These lenses do not concentrate the light in any way.

450. Do you find these lenses, these glasses I should prefer to call them, magnify the light?—No; the light is not intensified on account of the curvature.

451. I put the question for this reason. It might be desirable for this wick to be placed in the centre of the curvature or for the lens to be placed exactly with the wick as a centre; would you prefer that?—It is quite immaterial.

452. But if the lens were a magnifying glass, would it be immaterial then?—The lamp makers would in that case require to alter the curvature of the outer face of the lens to suit the position of the wick.

453. Here are four diagrams you have put in, and I notice the inner side of the wick is at an angle of something less than 1 degree with the chock?—Yes.

454. This dotted line shows that the angle of the light from the inner edge of the wick is a little less than 1 degree?—Quite so.

455. So that in this lamp with the same length of screen and the same breadth of wick there is a difference, possibly of 3 degrees?—Yes.

456. From the same wick?—Yes.

457. And in the same lamp?—Yes.

458. Then the full light could not be observed until the ship crossing the bow was so near that the 1 degree line would cross the other 1 degree line. Does your drawing show 1 degree?—No, I think not.

459. At what distance ahead would the whole light be visible?—I have here some tables which show that if the ship were 20 feet broad the rays would cross at 573 feet; if the ship were 30 feet broad they would cross at 860 feet from the light; and if the ship were 40 feet broad they would cross at 1,146 feet from the lights.

460. What would cross?—The rays from the inner edges of the wicks. With 50 feet between the lights the rays would cross at 1,433 feet from the lights; with 60 feet between the lights they would cross at 1,719 feet from the lights; and with 70 feet between the lights the distance from the lights to the crossing point would be 2,006 feet.

461. (*Sir F. Evans.*) If the crossing point for 1 degree is 1,719 feet, where would it be if the lights were screened to 4 degrees. I want to find out at what point ahead the light ceases to be seen when you approach it?—Quite so.

462. (*Chairman.*) Take it at 4 degrees?—With 20 feet between the lights the distance is 144 feet.

463. (*Sir F. Evans.*) And with 60 feet between the lights?—429 feet.

464. That means that there is a line of 1,290 feet during which the light would be gradually disappearing?—Yes.

465. (*Chairman.*) Take a vessel 60 feet broad, with ordinary wicks screened to 4 degrees?—The rays would cross at 429 feet from the lights.

466. Which rays?—The rays from the outer edges of the wicks. What I thought you wanted was to get the distance from the lights to the point at which the outer rays cross the middle line. In the case you are considering that distance is 429 feet, and the distance from the lights to the point at which the rays issuing from the inner edges of the wicks cross is 1,719 feet.

467. (*Sir Edward Harland.*) Is this 1,719 feet practically correct as representing the point at which by a theodolite you would just see the inner edge of the wick?—I think it is practically correct.

468. In other words, it amounts to this, that if you were standing at that point, looking at the ship, you would at this distance just see the entire light?—Yes, quite so.

469. (*Sir F. Evans.*) That is at the 1,719 feet from the lights?—Yes, at that point you would see the full light.

470. And the light would entirely disappear at the 429 feet distance?—Yes, all the direct rays would disappear.

471. (*Sir Edward Harland.*) At what distance from the ship do you think the full light ought to be seen?—I think the rays from the inner edges of the wicks should cross as early as possible.

472. That means at as short a distance as possible?—At as short a distance from the lights as may be practicable, and that would be obtained by getting a small powerful light.

473. Then are you in favour of the light from the outer edge of the wick crossing the bow at an angle of 4 degrees?—I am.

474. And you think that for practical purposes 4 degrees from the outer edge of the wick and about 2 or 2¼ degrees from the inner edge would be what you recommend?—We are now dealing with the outside edge of the wick.

475. If the angle from the outer edge was 4 degrees what would be the angle from the inner edge?—1⅛ degrees in the case of the 1¾ inch wicks.

476. So that it amounts really to this, this 4 degrees resolves itself into something like 1⅛ degrees from the inside of the wick?—Yes, with that size of wick.

477. And with this recognised plan of screening, that is, with chocks?—Quite so; of course we make the chock to suit the position of the outer edge of the wick.

478–9. (*Sir F. Evans.*) It would simplify matters very much if you were to take the wick and find out what difference was made by each change in its width. What is the width of this wick?—This wick is an inch and three-quarters wide.

480. What we want is rather to find out the point at which the lights disappear?—The tables I have handed in give you all that information. For instance, with 4 degree screening in the case of a ship 20 feet wide, the direct rays disappear at 144 feet from the lights, that is to say, the outer rays cross at that point; then if you take the beam of the ship at 70 feet, you will find by referring to the table that the outer rays cross at about 500 feet from the lights.

481. (*Sir Edward Harland.*) If you were not quite 500 feet from the lights, would you see the full strength of the light?—No.

482. (*Chairman.*) Is there any light seen?—Yes, within the distances I have given there is what I call scattered light to be seen. It is due to the internal reflection of the lens, and appears over the whole surface of the lens. The lens, in short, is a liminous surface emitting a faint light which can be seen at short distances.

483. (*Rear-Admiral Andoe.*) The triangle which is formed by the meeting of the outside rays is, with the exception of this scattered light, in complete darkness?—Quite so.

484. What length in that dark triangle would you consider safe?—As far as the dark triangle itself is concerned, I do not think it is of very great importance. With our rules the length of the triangle varies from 144 feet to 501 feet. But what we thought of very great importance was to fix the width of the field in which both lights are seen—to make its width constant or nearly constant for all vessels—and of course to do that the angle of screening from the outside edge or the wick had to be fixed.

485. We have heard practical people say that they do not mind very much within a very large limit indeed how long that dark triangle is; in other words, they do not attach much importance to seeing one light or both lights when they are pretty close?—I am quite prepared to hear that. Indeed, it is highly probable that you may find witnesses who will say that they do not object to the dark triangle extending even to 2 miles.

486. That is exactly what I wanted to know your view about?—My view about that is that the angle should be a fixed one, and I think, after giving this matter very great consideration, that the 4 degrees angle is the very best that could be adopted. I may tell you that we started with the thought that 3 degrees would be the better angle, but after making experiment at Glengall and Shoeburyness it was thought desirable to increase it to 4 degrees.

487. (*Mr. Ismay.*) When you first went into the matter the chief object you had in mind was to fix upon some uniform rule I suppose?—Quite so.

488. And the result of this experiment was, you thought it desirable that the angle should be 4 degrees not 3 degrees?—Yes, that is so.

489. If the difference is so small, why should you object to the 2 degrees?—Because I think the green to green and red to red rule a very excellent one, and one that should not be broken into on any account, and I think that in order to keep that rule intact you want the 4 degree screening.

490. It is to avoid throwing a man out of his track?—At 2 miles it is the greatest difficulty to see even a very excellent light on a very favourable night. I do not believe that any navigating officer would ever think of porting his helm at 2 miles, because the lights at that distance are so very feeble. I think it is more than likely that he would hold on until the lights became more distinct, and then he would either be out of the field in which both lights are seen, or the approaching vessel would be very considerably less than 4 degrees on his bow.

491. Would not good lights be seen high up on the bridge? Some bridges are very high out of the water, as much as 40 feet, are they not?—I do not think that would make much or any difference.

492. (*Sir F. Evans.*) Two vessels steaming at 20 knots would cover two miles in a minute and a half?—In 3 minutes.

493. (*Rear-Admiral Andoe.*) You can see good lights much further. I have seen them come on the horizon?—They cannot be seen further at Shoeburyness, unless under exceptionally favourable circumstances.

494. Right up?—No, Admiral Bowden-Smith stated at the Washington Conference that he had very great difficulty in seeing the electric lights of the fleet at 2 miles. Now those lights are very much more powerful than the oil lamps in the Navy, and the lights supplied to the Navy are superior to most of those in the Mercantile Marine.

495. (*Mr. Ismay.*) As a matter of fact the Dublin boats running between Holyhead and Queenstown are screened at 2 degrees; I suppose you know that?—No, I do not.

496. And one of the captains who was at the Washington Conference gave evidence to that effect, and he is a man who has had very great experience in crossing the channel, and he was strongly of opinion that the 2 degrees was safer than the broader 4 degrees?—I have no doubt there will be a considerable difference of opinion on that point.

497. I want to get your opinion about it?—But I do not know whether the gentleman referred to has ever made any experiments.

498. What I want to get at is this, whether you think the practical experience of those who have been in charge of ships, or the experiments which you have conducted under favourable or unfavourable circumstances should weigh most in the mind of the Committee?—I should say the man who has had great experience at sea, and who has had the other experience as well, would be the best man to guide you.

499. (*Sir F. Evans.*) Is it not possible that this captain may have thought his lights were screened to 2 degrees when they were really screened to 4 degrees?—I think it very likely that it was so. I remember getting some rather interesting information regarding a matter of that kind a little time ago. I went on board a ship, and was told by the superintending captain that the lights of all his vessels were screened to 2 degrees, and that 2 degrees was sufficient. But on measuring the electric lights of that vessel I found them screened to 5¾ degrees, and my friend was quite satisfied with them, although he was one of those who had joined in the outcry against 4 degree screening.

*Mr. P. Samson.*
4 April 1895.

500. (*Mr. Ismay.*) What objection would you see to the 2 degrees in open water?—I do not think the 2 degree screening would admit of the green to green and red to red rule being complied with with safety.*

501. That is your only objection?—There is the further objection that if they put in broad flat wicks they would not get the uniform light required by the Regulations, nor would they get a good light ahead—the experiments at Shoeburyness prove this. If they had small circular wicks the 2 degrees screening might be satisfactory so far as the uniformity of the light is concerned, but it would not be satisfactory under all conditions.

502. To put it shortly, if you could get good lamps, all screened to 2 degrees, you would think a considerable step had been made in the direction of safety?—I think the green to green and red to red rule a very important one, and it would be a great step back if you were to break into it. At present if you see a green light without a red light anywhere on the starboard side of your vessel, you know that that vessel will pass you at a safe distance, and that would not be so under all circumstances if 2 degree screening were adopted.

503. (*Chairman.*) You say this is practically important to have?—Yes, very.

504. It is the duty of the man when he sees the light, not merely to keep his eyes upon it, but to act?—Yes.

505. Then when he saw the green light a little on his starboard bow coming on, not broadening in the least, but coming on and getting narrower and narrower, any careful officer would say, this is a vessel I must act for?—If he had fine weather and plenty of time that would be so; but in dirty weather ships get very close before the green lights are seen; and he might even see more than one green light at the same time.

506. Still you must keep your eye on the vessel?—Yes. An anxious officer would keep a sharp look-out.

507. (*Mr. Ismay.*) How would the 2 degrees affect it in this way. Just point it out, so as to give us an idea?—Take a ship having a beam of 60 feet, and let another ship of the same beam be meeting her on a parallel course, then, by referring to the table, you will observe that when half a mile apart these vessels might see each other's green light without a red light, and yet collide or pass at a dangerous distance from each other if they kept their respective courses. Half the breadth of the field in which both lights are seen is only 23 feet at a quarter of a mile from the lights, and at half a mile it is only 75 feet. Moreover these may be regarded as the theoretical distances; the actual distances would generally be less.

508. That is, if two ships were to get within a quarter of a mile of each other in thick weather, the 2 degree screening would not do?—Yes.

* *See* Question 540.

## Wednesday, 24th April 1895.

PRESENT:

THE RIGHT HON. SIR FRANCIS H. JEUNE IN THE CHAIR.

Rear-Admiral ANDOE.
Captain WILSON BARKER.
Mr. BOLAM.
Captain CASTLE.
Captain HALLETT.
Sir EDWARD HARLAND.
Mr. ISMAY.
Mr. SCRUTTON.
Captain THOMSON.

Mr. C. HIPWOOD, *Secretary.*

Mr. PETER SAMSON recalled and further examined.

*Mr. P. Samson.*
24 April 1895.

509. (*Mr. Bolam.*) Is it possible to have one rule for screening lights for inland navigation and another for ocean-going navigation?—What do you mean by the term inland navigation?

510. Under local authorities; could you have moving screens in fact, so that the screens could suit the river navigation in the Thames here, for instance, and then could be altered for ocean navigation afterwards?—It would be very undesirable to have two systems.

511. So that, practically, the rule for screening which is adopted under the Merchant Shipping Act must apply to inland waters under local authorities, whether they like it or not?—It would certainly be most inconvenient to alter the screening when a vessel came into a river. But the rules covering river traffic would, I think, prevent any danger arising from the ocean system of screening.

512. There seems to be a good deal of confusion in the phraseology of the literature upon the subject. I suppose there is no means of clearing that up. For instance, "light" seems to mean four things. It seems to mean sometimes the lantern, sometimes the wick, sometimes the lens, and sometimes the flame?—The expression "light" is generally applied to the lantern, including the lamp, but it frequently means the flame only.

513. But so far as your department is concerned your expectation certainly is that the outside of the chock and the inside of the lens were fore and aft of each other?—That was the regulation as to screening from 1869 to 1892.

514. Previous to the 4° angle?—Quite so.

515. And you expect that is the practice at the ports?—That was the practice, no doubt, at the various ports prior to 1892.

516. Then you put in—or Sir Digby Murray did—a table of lamps, which apparently were in stock, and the table showed quite clearly that if the screening was carried out in the way the instructions direct the average angle would be about 4½°?—Yes.

517. So that from that point of view your angle would be reduced from 4½° to 4°?—Yes, to 4°.

518. As regards the actual screening which has occurred at the different ports, the only direct information we have upon the matter is in the table of ships which Sir Digby Murray, I think, put in. It gives details of screening of a number of vessels at Liverpool and London previously to the 4° angle being applied to them?—Yes, but there are other tables and reports on that subject. The reports have been handed in.

519. I think about 379 of the vessels?—Yes, in the table to which you have referred.

520. Of those about 118 were screened with either one or both lights over 4°?—Yes.

521. The vessels in which one or both lights were screened to 4°—either one to 4°, or the other to 4° or

less than 4°—was 87, and the number of cases in which both lights were screened to less than 4° was 174?—Yes.

522. So that you see the practice, at any rate as shown by that table, scarcely shows that the instructions of the Department have been carried out. You have 174 vessels with both lights screened to less than 4° out of 379?—I do not think that you are justified in drawing that inference from the figures. That difference was owing to the construction of the lanterns. No doubt all those lights had been screened at one time in accordance with the old instructions, *i.e.*, the outer edge of each chock had been in line with the inner edge of the lens.

523. No doubt; but it comes to this, that 174 out of 379 had their lights practically screened at an angle of less than 4°. The outside of the wick makes a less angle than 4° to the outside of the chock?—Yes.

524. Does not that seem to show that the general public, who, of course, cannot tell precisely what the departmental instructions are, have reasonable grounds for saying that, in a great number of cases, the Board of Trade practice has increased the angle?—Certainly, they are justified in saying that. But you have taken only one table; the other tables* show that the angle has been decreased in more cases than it has been increased.

525. I quite understand this is a scratch table of ships?—Quite so; when you get the other tables and reports before you, you will find that we have decreased the angle oftener than we have increased it.

526. At any rate, the statement that the Board of Trade have decreased it all round is not correct?—No. But on the whole we have decreased the angle.

527. In this table the number of lanterns which have been decreased in practice under your own rules seem to be very large; 174 in 379 is not quite 50 per cent., but very near it?—Quite so.

528. So that, just judging from this list, 87 vessels would be left alone, 118 would have the angle reduced, and 174 would have the angle increased?—Yes.

529. It has been said that the masters and pilots are approaching inaccuracy when they say an increase in the angle has taken place in a great number of vessels, but for that probably there is some foundation?—I am not aware of such a charge having been made. The angle has undoubtedly been increased in a considerable number of cases, but, as I said before, you will find when you get all the data before you that it has been decreased rather than increased, taking the whole of the cases we have collected.

530. The matter bears upon the experience of masters and pilots, you know?—Quite so, but pilots are not in a position to know precisely the changes that have been made in the screening.

531. (*Mr. Ismay.*) I do not quite follow Mr. Samson. He says, in one instance there has been an increase, and in another a decrease. I should like it to be made quite clear, whether there has been an increase in the angle in the majority of ships, or not?—In the majority of ships there has been a material decrease.

532. The figures quoted show that that is not so?—The figures quoted are taken from a single list. The reports on the whole show there has been a decrease.

533. But I take it, these are Board of Trade tables?—Yes, but there are others. The next witness will hand you another table which will modify that one.

534. (*Mr. Bolam.*) Some of the angles are very curious. One vessel is screened with one light at 11° across the bow; that is the port light; and the starboard light 12°?—I think there must have been some error in that particular case.

535. There is another 10°, and a great number are 8°. These are exceptionally large?—Quite so.

536. Then there are some strange eccentricities in the screening. One vessel, for example, has her port light screened at an angle of 4° outside, and the starboard light 6° inside—the vessel called the "Ennerder"?—In those cases I think the stanchions must have been bent.

537. (*Sir Edward Harland.*) Or perhaps they have shipped another lamp?—Yes; it is quite possible that may have been done.

538. (*Mr. Bolam.*) Or the screens warped?—No, I think the screens would not be warped to that extent. But it is quite possible, as Sir Edward Harland suggests, they may have shipped an odd lamp.

539. But this probably was not a Board of Trade screening?—Possibly not.

540. In answer to Mr. Ismay (Questions 500 and 501), you said the only objection you had to a two-degree outside screening was, that you thought the angle did not comply with Mr. Gray's rule of green-to-green and red-to-red?—If my answers to those questions will bear that interpretation I wish to say they do not express my meaning and should be modified. In connection with my answer to question 501 I should like to draw the Committee's attention to the experiments last made at Shoeburyness.* You will see there, if you refer to the various tables, that when the lights were screened to 2°, the full light was not seen ahead. The lights were not good.

541. 2° from the outside?—Yes.

542. (*Mr. Bolam.*) What is the size of wick?—In the Admiralty lamps the wicks were an inch and $\frac{5}{8}$ths, standing at a slight angle making them equal to wicks one inch and a half wide, standing vertical to the screen. The other lamps had one-inch wicks, and I think you will see that when both sets of lamps were screened to 2°, the light was not as good right ahead at the 4,000 yards range as when the same lamps were screened to 4°.

543. Then what is the modification you would make?—I want the answer to question 501 to read, "No, there is the objection that if they put in "broad wicks they would not get the light uniform," and so on. The answer stands as it is after that with the exception of some slight modifications that I have introduced to make it clear.

544. (*Mr. Ismay.*) As bearing upon this, do you think that the green-to-green and red-to-red rule would hold good under all circumstances. You do not think a man would get into trouble if he was to follow on those lines?—No, barring mishaps. I think the field in which both lights are seen, requires to be of a certain breadth in order to keep the commanders of ships out of trouble, especially in dirty weather when vessels might get within a mile or less of each other before they see each other's side-lights, and I think the breadth obtained with the 4° screening gives a fair degree of safety.

545. (*Mr. Bolam.*) Do you think your 4° screening affords greater safety than 2° when the green light of another vessel is seen very little on your starboard bow?—Yes, and to make the green-to-green and red-to-red rule satisfactory, the lights should not be screened to an angle less than 4°.

546. But is 4° sufficient for that purpose?—Well, I think it would be better more if there were nothing else to consider but the green-to-green and red-to-red rule.

547. You were speaking, on another occasion, of the great desire there was of having Mr. Gray's rhyme "Green-to-green, or red-to-red, perfect safety, go ahead" absolutely reliable always?—Quite so.

548. On page 5† of a letter you wrote to Sir Digby Murray of January 17th, 1895, you gave some very interesting tables, and amongst others you gave vessels meeting, and distant 1,000 yards from each other, and bearing from the intersection of the extreme outer rays of their side-lights 4°; and you gave the distance their sides would pass clear; a ship of 30 ft. beam would pass another ship at 165 ft.; and a ship of 60 ft. beam would pass another ship of the

* *See* Appendix 2, Nos. 2, 7, 8, 9.

* *See* Appendix 2, No. 11.

† *See* Appendix 2, No. 14.

*Mr. P. Samson.*

24 April 1895.

same beam at 120 ft. And a ship of 70 ft. beam would pass another ship of the same beam 105 ft. That is about a beam and three quarters of space. That would not be in "perfect safety"?—No, I think not in the case of the large ships; but at the starting point (1,000 yards), each ship would be overlapping the other ship's field of mingled rays to the extent of half her breadth, and that, taken in conjunction with a slight yawing motion, would either cause them both to port or keep them further apart.

549. You see a large ship would require very much more margin than that, simply because you cannot depend upon steering her straight. I mean to say that it seems to me that your table, if it shows anything at all, shows that from that point of view, green-to-green and red-to-red, 4° is a miserably insufficient angle, and that the lights should be screened to a much larger angle?—In dirty weather a larger angle would be better, but if you increase the angle, then you get a very great breadth of field in which both lights are seen at a distance of two miles.

550. But it would be a grave misfortune if the service got it into their heads that your 4° angle and "green-to-green, red-to-red, perfect safety, go ahead," is right, and is always dependable?—I think it would be most desirable that the rule should be dependable, and it was with a view of making it so amongst other reasons that the 4° screening was adopted. The experiments made at Glengall convinced Sir Digby Murray and myself that it would not be dependable with a finer angle of screening than 4°.

551. But do you not think it would be a grave misfortune if the service got it into their heads that your 4° angle and "green-to-green, to red-to-red, perfect safety go ahead" was always dependable? You know the service do not believe that now. They know that when a green light is only a very little on the starboard bow it is one of those cases in the rule of the road which must be got over by the skill and sagacity of the officer navigating the ship?—I was not aware that the "green-to-green" and "red-to-red" rule was not considered dependable; on the contrary I thought it was considered dependable, and I thought it so myself until I witnessed the experiments at Glengall. No doubt, if two vessels of 70 ft. beam meeting got within, say, half a mile of each other, and were just outside each other's field of mingled rays, it would be a very close shave if each vessel kept its course. There would be only 175 feet between the ships when passing.

552. So that, even though you retain the angle of 4°, a seaman might not take it for granted that green-to-green and red-to-red is absolute safety?—The expression "absolute safety" is, perhaps, too strong. The vessels would pass clear, but it would be a close shave.

553. The misfortune of the rhyme is that the word "perfect" is far too strong?—Yes.

554. (*Captain Thomson.*) After all, it is only a rhyme, it is not the rule of the road?— It was, I believe, adopted by, and received the official approval of, the Admiralty, Board of Trade, Trinity House, and French Government. If the rhyme is not true, Rule 16 of the Rule of the Road would seem to require modification.

555. (*Mr. Bolam.*) I am only surprised that the Board of Trade or Sir Digby Murray has placed great reliance upon it?—It is considered most important, because it fairly expresses the practice of seamen.

556. It is only a very rough-and-ready rhyme, and that is all?—Perhaps so, but it is a fact that 4° screening would give a very fair degree of safety.

557. More safety than 2° no doubt; but whether 4° is very much better safety is a matter about which, I think, one may safely say there is some doubt. The margin in both cases is so exceedingly small as to be approaching an infinitesimal margin of safety?—Quite so. But ships are never going in an absolutely straight line; there is a certain amount of yawing, even with the largest vessels, and that improves the 4° screening at short distances; moreover, the experiments made at Shoeburyness show that when the lights are screened to 4° they show at short distances from the vessel, somewhat farther beyond the middle line than that due to the screening. At a distance of a mile and upwards the 4° screening gives "perfect safety."

558. Then you have placed very much dependence upon these valuable experiments made by Sir Digby Murray and yourself, both at the Glengall Ironworks, and the larger series of experiments performed at Shoeburyness?—Yes. But I think the Shoeburyness experiments are very much better than the others, because everyone has to get experience in making experiments as well as in making the apparatus, and, of course, we had had the previous experience to assist us at Shoeburyness.

559. You made the first experiment?—Yes, in conjunction with Sir Digby Murray. I was responsible for the mechanical arrangements.

560. And the last?—The whole of the mechanical arrangements were devised by me, and I was present at the lamp station in order to satisfy myself that the changing and screening of the lamps were done properly. Sir Digby Murray was one of the observers.

561. I think altogether there are 10 of these experiments counting them each as one; you made two on the 5th of May, four on the 12th and 13th of October, and three or four, I cannot make out which from the Report, on other dates. It is 9 or 10 altogether?—We regard them as three experiments only. Of course a considerable number of actual experiments are included in those three.

562. In the paper placed before the Committee, I think the first series of experiments are those at Glengall Ironworks, and the last those at Shoeburyness?—Copies of both reports have been handed in by Sir Digby Murray.*

563. But some of the experiments have not been put in. For instance, the experiment tried on the 25th June 1891, does not seem to be put in here, though I have a record of it somewhere?—I can hand in a copy of the results if the Committee wish it.

564–5. Yes. That is where I have taken them from. I have a copy of it. But I wanted to ask you a word or two about these experiments, the details of which, no doubt, you are quite familiar with. Does it not occur to you in these experiments, that the only thing positively settled is that you are going to be very uncertain where the outside rays of the green and red lamps are seen at all?—That is so. In the whole of the experiments there was a very great difficulty in finding the exact point where the red and green outside rays terminated. When taking the measurement the observers walked out from the middle line until they thought they had lost the light, and then measured the distance; then they walked away further, say 20 or 30 yards, and turned, walking back until they thought they saw the light again; then they re-measured the distance from the centre line. When they did that they would perhaps find a couple of yards difference, or even more than that, in the measurements.

566. No doubt, but you would expect that the rays screened, say, to 4° would not have shown outside of 4°?—No, I was rather surprised to find them show out so far as they did, but I now understand why.

567. I see that in some experiments which Sir Digby Murray and yourself made, you have screened the lights to 4°, and according to the table of your experiments it shows that at a distance of 815 feet from the lanterns the outside rays of the green light were showing or just disappeared at an angle of 6° 12″, and the red at an angle of 8° 20″, and further out, 1,200 feet from the lamp, it was 5½° and 6¼°?—These experiments were made at Shoeburyness, not at Glengall. The distance from the observers to the lights was 815 feet. The angle corresponding to the distance from the middle line at which the outer rays of the green light disappeared was 6° 12′, while that

* *See* Appendix 2 Nos. 5 and 11.

of the red light was 8° 20′. The lamps used had lenses of large radius, were exceptionally powerful, and burned 2½ times the quantity of oil that is burned in good ordinary lamps. The light seen at the angles named did not come from the flame direct, it was the scattered light, or what is sometimes called the loom of the lens. If the lenses had been of greater radius the angles referred to would have been greater also without any change being made in the screening.

568. I do not know whether that was so in the case of the green light?—In the case of the 3° screening at Glengall, I find from a paper I have before me that the red light showed 24·2 feet beyond the distance it should have done at 300 feet from the lights, while the green light showed 3·2 feet beyond that, due to the screening.

569. I was curious enough to translate these distances into angles in order to show how the 4° angle twisted them, because certainly at the first experiment at Glengall at your longest range, 840 feet, the red showed at its proper angle, 3°, and the green has been cut down to 2° 11′. Therefore it failed to show as far as it should; but in the experiments I have just mentioned that 4° angle became very much larger?—Yes, that was due to the lamps used at Shoeburyness being large and of great power, and to the observation being taken at a short distance from the lights, *i.e.*, within the range at which the scattered light is visible.

570. At any rate, it shows really that the angle at which you see the red and the green cannot be depended upon, however careful you are with your screens?—No, that is not so. The light you see there is what I call scattered light. You may get entirely out of range of the direct light, and still see light from the lens, but that light is negligible, as it can only be seen at short distances from the lamps. The table* I have handed in shows that the distances the direct rays are seen beyond the middle line agree very closely with that due to the screening.

571. Your superintendent at Shoeburyness has a long experience in physical experiments?—You are alluding, I presume, to the Assistant Superintendent of Experiments, who is an Artillery officer; the nature of these experiments is always settled by the Board of Trade.

572. He has much more than you have?—Perhaps so.

573. Therefore if he conducted a systematic set of experiments there the results would be more satisfactory than one or two carried on here and there, would they not? You say you have had no long series of experiments at Shoeburyness. It is apparently at your own and Sir Digby Murray's suggestion that this experiment, which is an extremely valuable one, should be tried?—I think the last series of experiments at Shoeburyness were not only very interesting and valuable, but somewhat exhaustive; and the whole of the mechanical arrangements in connexion therewith were devised and supervised by myself. The credit of suggesting the experiments is, I think, due to Sir Digby Murray.

574. It is just possible, upon these two nights, the lights have had what you might call ordinary fair play?—These nights were selected, of course.

575. I notice that the last series of experiments made there come wonderfully close to the screening?—Yes, remarkably so.

576. But what struck me was that Sir Digby Murray's experiments and yours have resulted in, as it seems to me, this, that you cannot depend upon the green and red lights showing to the theoretical angle, or depend upon the angle however you place them?—The Shoeburyness experiments are about as much Board of Trade experiments as those made at Glengall. The latter show what takes place at very short distances when lamps having thick plano-convex lenses are used, and the results would have been the same if the tests had been made at Shoeburyness or elsewhere with the same apparatus and lamps.

577. But would it not have been better if these experiments had been somewhat more systematic and carried over a longer period. Do you not think that so far the results are sufficiently discordant to make a person, used to physical experiments, somewhat doubt the results?—Sir Digby Murray can give you this information, but I am told it is not practicable for the Board of Trade to ask the Superintendent of Experiments, who is an artillery officer, to make constant experiments. The Shoeburyness experiments were simply an extension of those made at Glengall. I thought the last experiments exceedingly well done, and consistent throughout, and that was the opinion of the Committee who witnessed them. They were made with very much better apparatus than the previous ones, and on that account I attach much greater importance to them.

578. Quite so, so do I, because they are made by a man who knows a great deal better how to carry them out than amateurs would?—The Assistant Superintendent of Experiments was of great assistance, but the mechanical arrangements were on this as in all previous experiments carried out by the Board of Trade officers, not by the staff at Shoeburyness.

579. Then these last experiments were made in the presence of the Rule of the Road Committee?—That is so.

580. On the 8th of December 1893, a report* was presented to the President of the Board of Trade by the Rule of the Road Committee, and they refer to this matter, and they conclude their report by saying:—"At the same time we desire to point out that no "strict uniformity of the angle at which the full "strength of the lights is in practice visible is "possible, so long as a great variety of patterns of "lamps are in use, and in view of this fact, as well "as of the great improvements which have been and "are being made in the construction of lamps, and in "the power of illuminants, and of the great increase "in the size and speed of ships, we think that the "Board of Trade should in certain cases, upon the "request of the shipowner, have power to allow the "angle of screening to be reduced to 3°, or in special "cases to even less than that angle." It is signed, amongst others, by Sir Digby Murray. That appeared to be the written conclusion which the Rule of the Road Committee came to after seeing the experiments?—That is so. Of course, at the time the Rule of the Road Committee signed that report, there was a good deal of talk about using very much stronger lights than those then in use, and that, no doubt, affected their decision, for if you use very strong lights that will show, say, twice the distance of the present lights, and screen them to 2°, you get about the same width of field that you have now with the 4° screening; increasing the power of the light and reducing the angle of screening does not improve matters from the pilot's point of view.

581. Then we come naturally now, from what you have said, to what I will call the disadvantages of the rule of screening from the outside of the wick. Do you agree that there are disadvantages, first of all, because the outside rays may or may not agree with the angle of screening?—It has been proved at Shoeburyness by actual experiments that they practically agree with the screening.

582. But taking all the experiments together, they show that you are never quite certain where the straggling rays will be?—The straggling rays (scattered light) may, I think, be disregarded. I might say, however, that they extend from about 800 to a thousand feet, from good ordinary lights, and if the lights are exceptionally powerful, such as the large Harvie lamps at Shoeburyness, which burn 2½ times the amount of oil that ordinary lamps burn, those rays will extend beyond a thousand feet from the lights. At short distances from the lights the straggling rays cross the middle line produced at a large angle even

* See Appendix 3, No. 3

* See Appendix 1, No. 4.

*Mr. P. Samson.*

24 April 1895.

when the flame is completely masked from ahead, *i.e.*, screened to an angle of 0°.

583. Then there is another disadvantage. The better the lights become, or I will put it this way, the more nearly your source of light becomes a luminous point then with your 4° angle from the outside, the more nearly will the whole amount of the uniform or unbroken light be thrown across the fore and aft line, that is to say, the more nearly will the uniform unbroken light show over an arc of 10 points plus 4°. You effectually tie the shipowners' hands under your angle to the 4° from the outside, and you entirely prevent him or your officers from carrying out the recommendations of the Rule of the Road Committee, because evidently you could not allow a shipowner to screen 3° or less than that, unless you issue special instructions which would be quite inconvenient?—Quite so. The shipowner would have to show that he was justified in screening to a smaller angle before it would be allowed.

584. That is so?—Yes. But I do not quite see the point of that question. We never get a luminous point, and from our present experience I should say we are not likely to get one.

585. I saw side-lights, which I believe are the best, or amongst the best, in Scotland the other day; they are circular wicks, burning colza oil, and the diameter is $\frac{7}{8}$ of an inch?—No doubt.

586. There the source of the light is approximating very close to the luminous point?—When the present Instructions were framed we had to take lights as we found them; and it is so still. I think it would be very desirable if we had circular wicks, but before any change could safely be made on that account, it would be necessary to have lamps so fitted thoroughly tested.

587. In regard to altering the length of the screens, where you have your light angled at 4° from the outside you cannot make the screen shorter than 36 inches, of course?—Not according to the Regulations.

588. But there is nothing to prevent their being made longer?—No, nothing of any importance, except their unsightliness in small vessels.

589. If you make them longer than 36 inches—48, for example—that has the effect of throwing the light from the inner edge of the wick, which is the whole force of the light, over an increasing angle?—No, that would rather reduce the angle.

590. From the inside?—Yes.

591. Have you worked that out?—Well, I think it is obvious.

592. The obviousness is the other way, is it not?—No, I think not.

593. Take an inch wick; keep your wick constant at an inch, with a 36-inch screen, the angle of the inner edge would be 2° 25′, and on a 48-inch screen it is 2° 48′?—Yes, that would be so with a constant angle, but I thought you only meant to lengthen the screen, in which case the angle from the inner edge of the wick would be reduced.

594. So that you, to a large extent, tie the hands of a ship which for one reason or another may be compelled to have a longer screen than 36 ins.?—I am not aware that anyone desires screens longer than 36 inches, and I know that many of the smaller ships prefer them shorter.

595. Still, as a matter of mathematics, if you do make the screen longer you get the full force of the light thrown across at a bigger angle the longer you make the screen?—Yes, quite so; the rays from the inner edge of the wick would cross nearer the stem with the longer screen than with the 3 ft. one.

596. You see the Board of Trade Instructions to surveyors compel us to adhere to the constant angle—we have no choice?—Quite so.

597. Supposing you vary your instructions so as to screen from the inside, your statutory duty is to deal with the uniform unbroken light—those are the words in the Act upon which all these instructions, of course, are based. Supposing that you deal with the uniform unbroken light, and issued your instructions screening from the inside of the wick, would you not have these advantages: first, that you could secure with absolute certainty the angle across the fore and aft line at which the full unbroken light could be shown—you could make it 0°, or 1° or 2°?—If you screened from the inside of the wick you would make the screening from the inside of the wick constant, but the screening from the outside would be variable?—The other is by far the better way. I think the screening from the outside of the wick should be constant, and the inside variable, because by that system of screening the lights show to the same or nearly the same distance across the vessel's path in all cases, and that I regard as a point of the very highest importance; moreover, it admits of a standard lamp and screen being used, and that also is a matter of great importance.

598. You want to secure some sort of uniformity at sea?—Yes.

599. Are you securing that uniformity; your scattered diminishing rays are of very little value—you are varying the full body of the light?—When the lights are screened to 4°, in accordance with the regulations, the lights are quite satisfactory.

600. Better outside than inside?—Yes. I think you would find the pilots raising objections to a variable angle of screening. It would, in my opinion, be a source of very great danger.

601. At any rate, if you screen from the inside you would be able to have with absolute certainty your uniform unbroken light?—Oh, yes.

602. And the variations of the screens, if they did occur, would only be with the diminished and straggling rays. The variation in the full volume of light, which I have pointed out, when you angled from the outside, would not occur when you angled from the inside. Instead of taking a piece off the base of your triangle at the acute angle, you are taking it off the other end where the right angle is?—I am afraid I do not follow you. If you screen from the inner edge of the wick, then, of course, you could make the rays from the inner edges cross at any given distance from the ship, either two miles or half a mile, or at any other distance. I would point out, however, that the light which is seen at the outside of the field of mingled rays is not what is known as straggling or scattered light, but feeble direct rays which are completely under control.

603. But you could make them cross at an angle?—Yes.

604. You could fix that angle and stick to it?—Yes, but the angle of screening from the outside of the flame would be a variable.

605. Undoubtedly, you cannot secure a constant all through?—And I certainly think that constant screening from the outside is better than constant screening from the inside.

606. You see that with the screening from the outside of the wick, the whole body of the light will vary with the length of wick and the length of screen, whereas with the angle taken from the inside the full body of the light varies with neither, and thus it is constant with them?—Quite so, but it is neither necessary nor desirable to have screens of different lengths, and unless the lamps are made to a standard pattern, and provision made for keeping the wicks, when of the float type, in one position, conditions might and would doubtless arise which would render screening from the inside of the wick positively dangerous.

607. Supposing you angled your light from the inside at 1°, that is to say, suppose the regulations were that the 10 points should include this, that the inner edge of the wick should be screened 1° across the outer edge of the chock; that is angling to the inside 1° across the bow?—Quite so.

608. Roughly speaking, that would enable a vessel to see both lights full about three lengths ahead. You will perhaps have no time to work this out just now. It does do that, and if you angle the lights at

an eighth of a point across, it will enable you to see both lights of a vessel full about two ships' lengths, roughly. I have worked it out for two cases. I have worked it out for the "St. Louis" which was launched the other day, 60 feet beam. I also worked it out for a vessel of 30 feet beam. The results are about identical, roughly speaking, in both cases. It is no use higgling about a few feet in these matters?—Take a ship with 50 feet between the lights. Then the rays from the inner edges of the wicks would cross at 1,433 feet from the lights, the inner edges of the wicks being screened to 1°.

609–11. (*Chairman.*) With this inch wick, what angle from the inside of the wick is 4° from the outside equivalent to?—It is about $2\frac{3}{8}$°.

612. As much as that?—Yes.

613. (*Mr. Bolam.*) At any rate, there is no doubt that a satisfactory system of screening might be brought about by taking the inside of the wick, and there would not be so many variables in the outcome as when you take the outside?—I do not think so. I think it would be a great mistake to take the inside.

614. At any rate you have a smaller number of variables when you screen from the inside than when you screen from the outside?—No, I do not see that at all.

615. When you screen from the inside the angle at which the whole body of the light crosses the track, is a constant?—Quite so.

616. When your angle is taken from the inside, the angle at which the light from the whole of the width of the wick is a constant. Those are advantages?—I do not think they compensate for making the outside angle variable.

617. What do you think is the special advantage of the outside?—Whenever a ship finds herself in another vessel's field of mingled rays, that is, the field in which both lights are seen, she knows at once that she is within 4° of that vessel's course; and that to my mind is a very great advantage; besides, a variable angle would be a source of danger inasmuch as two ships meeting nearly end on would not be sure of seeing each other's three lights.

618. But you could secure all that, and with fewer variables in the outcome?—I do not quite see how you are going to do it, unless you make the diameter of the wick a constant. But if you allow, as now, the lamp-makers to use flat or circular wick, I do not see how it can be done.

619. It is only the outside of the smaller rays which vary?—It is a gradually decreasing light, no doubt, but it is a light which cannot be disregarded.

620. The great object when you are end on, or nearly end on to a vessel is to have both lights shown with perfect fulness and distinctness right ahead?—Quite so.

621. And at the same time not to have the angle so large but that vessels can get past each other without either turning over with too much helm, and getting more broadside on, which makes a much larger object to strike at in case of danger of collision occurring?—Yes, I agree, but I do not think screening from the inside of the wick is the best way of attaining that object: it is not nearly so good as the present system.

622. (*Mr. Ismay.*) It would involve some expense too, would it not?—Yes, it would cause expense to change the screens; but that would not be a very serious matter.

623. (*Mr. Bolam.*) It was said that in Glasgow there was no return kept of this old angling, so you cannot tell me whether the Clyde ships are screened to a greater angle than before?—No.

624. (*Captain Hallett.*) With regard to the navigating in narrow waters in rivers; owing to the banks, and necessary turns, and things, is it not the case that the absolute rule of the road is put on one side?—Yes. In cases of that kind, the rule of the road is put on one side.

625. The amount of screening has no effect whatever upon the action of the pilots in an intricate river navigation?—I think not.

626. Article 15 of the Regulations provides that where two steamships are meeting end on, or nearly end on, each shall alter her course to starboard, so as to pass each other port side to port side; that does not apply by night to cases where the red light of one ship is opposed to the red light of another, or where the green light of one ship is opposed to the green light of the other. It is upon that Mr. Gray's rule is founded, I suppose?—Quite so.

627–8. Then as the 2° screening. I wanted to get from you what was the distance from one another at which two ships passed where the lights are red-to-red, or green-to-green?—Well, in a given ship with, say, 50 ft. between the lights, the distance at two miles would be 394 ft.

629. Now, at one mile?—They would be 185 ft. But the light at that point would be very, very feeble. It would be very difficult to make sure that you saw the light there, as you would be right on the outside fringe of the field.

630. (*Chairman.*) The table which you have handed in is only worked up to 1,000 yards, is it not?—I have got a few tables here, which I intended to hand in when I was last here, and did not. The three tables* I now hand in show the effect on the width of the field of screening the lights to 1°, 2°, and 3° respectively. I handed in one for the 4° screening last time I was here.

631. You were kind enough to show us this last time?—Yes, I handed you the one showing the 4° screening.

632. (*Mr. Scrutton.*) At page 46 of the Regulations of 1891 it says, "The inboard screen should be so "fitted as to prevent the red and green rays crossing "too close to the ship"?—Yes.

633. And on page 48 of the 1891 Regulations it says if they do not cross at least to a slight extent then they cannot both be seen ahead?—Quite so. Is that a copy of the 1891 Instructions?

634. The 1891 Instructions. The 1894 Instructions, I believe, are precisely the same. Now the 1894 Instructions say, "The side lights are always to be "screened to an angle of 4°"?—Yes. But the 1894 Instructions are not precisely similar to those issued in 1891.

635. You admit, I suppose, that that is a very important alteration?—Well, it was an alteration for the better.

636. But do you admit it was an important alteration, because they do not mean the same thing?—Yes, I think it was an important alteration.

637. Can you kindly tell me how it was that alteration came about?—It was with the view of ensuring the lights showing at a constant angle.

638. May I ask who started it?—Well, that I cannot say. I know that they fixed a maximum angle at the Washington Conference, that is to say, they passed a resolution to the effect that the lights should cross at an angle not exceeding half a point.

639. Do you know who drew up these Instructions?—Well, Sir Digby Murray partly. I do not know whether he did them wholly or not.

640–1. Perhaps, subject to your decision, Mr. Chairman, we might know the history of the difference between the 1891 Regulations simply upon that special point, as far as I am concerned, and the 1894?—(*Chairman.*) We will ask about it.

642. (*Mr. Scrutton.*) Then in the 1894 Instructions you give a diagram (plan 3) in which you say that with a vessel with 20 feet between the lights the intersection of the rays takes place at 143 feet from the light?—Quite so.

643. Screened to 4°?—Yes.

644. If the screening was at 3° that intersection would take place at 191 feet?—That is so.

645. Do you attach any importance to the difference of 48 feet?—None whatever, except that it indicates a decrease in the angle of screening.

* *See* Appendix 3, No. 1.

*Mr. P. Samson.*

24 April 1895.

646. If the screening was at 2° the intersection would take place at 286 feet?—That is so.

647. Do you attach any importance to the difference of 140 feet between the 4° and the 2° ?—No, I do not attach importance to that increase in the distance at which the light crosses from the head of the ship.

648. And just to complete that, if it were 1°, the intersection would take place at 573 feet?—That is so.

649. What then is the reason that you prefer 4° to 1°, of course it is some other reason than the question of the point of the intersection?—It is to get a uniform light from right ahead; and to enable the green-to-green and red-to-red rule to be complied with with a fair degree of safety.

650. Supposing the vessel is 60 feet beam—we have taken 60 feet as an example—and the light pointed right ahead, and there was no angling of the lights at all?—Yes.

651. A vessel of 30 feet beam approaching would not see the light at all, would it?—No, provided the other vessels had no lateral motion.

652–3. He would see the masthead light?—Yes.

654. What would be the duty of an officer seeing the masthead light, and not seeing the side-lights?—He would keep an eye upon the light for some considerable time to see if it was changing its bearing.

655. Would he not try by altering the position of his own ship to see one of the other lights?—Well, that I do not know.

656. Do you not think he would?—I do not know. I have not experience of that kind. I certainly think he would keep his eye on the light with the view of ascertaining how the ship was steering.

657. My point is simply this—I want to see to satisfy my own mind, because I have no practical experience of seamanship—why it is that you are so very rigid about the 4° being the right angle when you admit that it is not a question of the intersection. The fact seems to me to be as follows:—In the instance I gave you of a vessel 20 feet beam, at 143 feet you enter the dark lane in advancing towards the approaching vessel, but that at 150 or 160 feet you would see both lights?—What I understood you to mean was this: is it objectionable to have the dark triangle between the lights and the crossing point onger in the one case than in the other, that is, longer in the case of 2° or 3° screening, than it is with 4° screening. So far as the dark triangular field is concerned I do not think it matters one bit, but, of course, the distance from the lights to the crossing point governs the width of the field, and it becomes important in that respect.

658. Your paper here says that if the vessel is 60 feet beam then the rays intersect at 429 feet?—Yes.

659. Then if it is screened to 3° they intersect at 572?—Yes.

660. And with regard to the point of intersection you attach no importance whether it is 4° or 3°?—So far as the distance from the lights to the point of intersection is concerned, no; I think when two vessels meeting end on get within 572 feet of each other it does not matter whether they have lights or not.

661. (*Captain Thomson.*) I was going to ask you whether the schedule to the Order in Council* plan still gives the opinion of the Board of Trade?—Yes, it does. The second part is explanatory of the Regulations in the first part.

662. The second part of it. I think it is merely an order to the surveyors?—Yes; but it also explains the first part.

663. Then I see there is an alteration made here. The International Regulations for Preventing Collisions at Sea say that the side-lights "shall be "so constructed as to show an uniform and unbroken "light over an arc of the horizon of 10 points of the "compass, and so fixed as to throw the light from "right ahead to two points abaft the beam." The new Order in Council says the lights shall show over 10 points plus 4°. That is a change?—Yes. That schedule was, I believe, prepared with a view of defining the meaning of the phrase "right ahead," and also of satisfying those who thought the Regulations did not admit of the lights crossing that 4° screening was not in any way an infringement of the Regulations. I have not had anything to do with the drawing up of that schedule.

664. Can you tell the Committee who had the drawing up of that schedule?—I do not know.

665–6. I want to know whether this is a change, or simply explanatory?—Sir Digby Murray will be able to give you that information when he comes before you.

667. It says here, "The lights shall be screened "so as not to show across the bow of the ship "itself." Then further on I see, "The light shall "not be considered to be so screened unless they "are screened to 4°." But surely it is not necessary to screen it to 4° to prevent it showing across the bows of the ship?—Yes, certainly. If the lights were screened to a larger angle than 4°—as many lights were before the present Instructions were issued—and placed well aft, the most convergent direct rays might cross abaft the stem. Even now with 4° screening, and the lights placed amidships, some of the rays fall inside the ship; and in cases where light-towers are used a very considerable number of the rays fall inside the ship. Again, in Her Majesty's ships, in which the lights are placed on a raised platform amidships, very much narrower than the ship itself, or on the sides of the funnels, a very large number of the rays pass over the ship's deck.

668. Then you think it is necessary in order to prevent showing across the bows of the ship itself, that the light should be screened to 4°?—Well, I do not think it was for that purpose alone that the lights were screened to 4°. The schedule requires the lights to be uniform from right ahead of the ship to two points abaft the beam on either side, and the 4° screening admits of that being effected, while it also prevents the lights from crossing abaft the stem.

669–70. You said, I think, in your evidence, that you were in favour of the wick being central to the curvature of the lens?—Yes.

671. Have you noticed that that never is the case in any of the lamps?—No. It was so in most of the old-fashioned lamps, but it is not so now, nor since the new instructions came out.

672. In what lamps is that so?—In the lamps made in London and elsewhere.

673. Of later date than 1893?—Yes, since the instructions came out. I know that Ridsdale's have altered their lamps to suit the new requirements, and I know that other makers have also.

674. Do you notice, in this very good diagram in the German paper,* that the wick is not absolutely central to the curvature of the lens?—I know it is not so, but I think it is better that it should be so; where you are dealing with a large staff it is better to reduce the rules to as simple a form as possible.

675. It seems to me, in all the lamps made, not only is the wick not central to the curvature of the lens, but the lens has no fixed centre; it is a curve of a varying character. It is in all the lamps I have seen, and it is in all these diagrams, and it is in nearly all the diagrams put in by the Board of Trade?—I think you will find that both the lens and shade are parts of cylinders.

676–81. Then you think they were not purposely made with varying curves?—No, they were parts of cylinders. The old-fashioned fish globe lenses are blown spherical, and then split into three parts.

682. When you speak of a lamp not being good when viewed from right ahead, you would not expect a lamp viewed from right ahead to be so good as when seen at an angle of 45°?—Yes.

683. You would?—Yes.

* Appendix 2, No. 12.

* *See* Appendix 2, No. 10.

684. Independently of position of wick, or anything?—If the lamps are made in accordance with the present Instructions they will show just as well ahead as in other directions. In the old-fashioned lamps they did not, they showed much better at five points, but in lamps made in accordance with the present instructions they show just as well ahead as at five points.

685. There is now a question of rather wider interest I wanted to ask you, independently of the argument about fine or broad screening. Do you not think that under the present Rule of the Road it is necessary to have a certain angle of crossing?—Yes, and I certainly think the angle of crossing should be fixed. I do not think it matters very much what the angle is, provided it is sufficient to cover the green-to-green and red-to-red rule, and the rule as to uniformity. If you increased the screening to 5°, there would, in my opinion, be no objection to it whatever.

686. Even if it was proved that finer screening was better than 4° or a large angle of screening, yet it is necessary to have a certain angle of screening to satisfy the rule of the road?—Yes, and if the angle of screening corresponded with the legal definition of the term "right ahead," then I think it would be desirable to have a fairly large angle.

687. The Rule of the Road distinctly says that when two ships see each other's side-lights ahead, or nearly ahead, they are to port, at night time. Of course, if they had a fine angle of screening they would have to be very nearly end on indeed in order to satisfy those conditions?—Yes.

688. Therefore, if two ships had a different angle of screening, one ship might come under those regulations, the other might not?—Quite so.

689. Therefore, you think the angle of crossing or screening should bear the same proportion, or be the same as the angle which is the limit of to right ahead or nearly right ahead?—Quite so, and I think the angle should be sufficient to keep ships nearly ahead of each other, or at a very fine angle on either bow from coming into collision.

690. In Mr. Gray's rhyme, what do you suppose he meant by "green-to-green" and "red-to-red"?—What I think he meant was, that if two ships were meeting on parallel courses, and, say, 5° or 6° on the starboard bow of each other, each vessel would see the green light of the other vessel and keep her course.

691. But do you not think it right, as in the rules, that if the ships have green-to-green there is perfect safety, and excepting accidents of steering they will pass clear of one another?—It would be so with 4° screening.

692. But do not you think that would be the same with any angle of screening?—No, I think not. Sir Digby Murray will show you some diagrams which he has had prepared to illustrate that point, and from which it will be seen that a smaller angle would not be so satisfactory.

693. But I think that Mr. Gray meant when he said "green-to-green" that the green light of one ship should be actually on the starboard side of the green light of another ship, he did not mean that one green light should be ahead of the other ship's green light, and he did not mean that one green light should be on the port side of the other ship?—That is not what I understand it to mean. I take it to mean that when green opposes green anywhere there is perfect safety.

694–5. But so long as the green light makes any angle at all with this one, I do not care how fine it is, they must pass clear, is not that so?—No. I do not think so. In that case the ships would come into collision—their spars would foul. (*Describing.*)

696. Excuse me, they would not come into collision, because if they came into collision there would be no angle in that case between their green lights?—If you draw this vessel's path you will find that it is so.

697. I am not speaking of the paths of the ships at all, I am simply speaking of green-to-green?—But the observer may be anywhere in the ship, and if he were there he would see the mast-head and green light of the other ship at a small angle.

698. But I do not think it matters where the observer is, it is a question of the green light to green light?—But I think the officer of the watch on this ship seeing a green light there would be justified in thinking that he was perfectly safe.

699. As regards the lamp you say I think the dirt on the sides of the lens is a source of danger?—It is.

700. Do you not think it would be possible to make a lamp having a larger lens, or a lens of a larger arc than the necessary 10 points? You could have slides put inside the lens which could be put into position after the lens is cleaned, and so arranged that the lamp should not be fixed in its place unless those slides were in their proper places?—Yes, I think that could be done.

701. That is a rough diagram. That is the principle I mean (*produced*). The slides are put inside the lenses?—But the slides add complication to the lamp.

702. But still it would be possible to construct it?—Yes, but I think a simpler plan than that would be either to fit an outside screen, or make the housing flush with the outer surface of the lens as shown in the plans of the additional mast-head light proposed by Sir Digby Murray which I have handed in.

*Mr. P. Samson.*
24 April 1895.

---

## Thursday, 25th April 1895.

PRESENT:

THE RIGHT HON. SIR FRANCIS H. JEUNE IN THE CHAIR.

Rear-Admiral ANDOE.
Mr. BOLAM.
Captain CASTLE.
SIR FRANCIS EVANS.
Sir EDWARD HARLAND.
Captain HALLETT.
Mr. ISMAY.
Mr. SCRUTTON.
Captain THOMSON.

Mr. C. HIPWOOD, *Secretary.*

### Mr. JAMES RAMSAY called and examined.

703. What is your name?—James Ramsay.

704. What is your business?—Board of Trade engineer surveyor, and Principal Officer for the North-Eastern District of England.

705. Have you had sea experience?—Yes, about 16 years in the merchant service.

706. Is it one of the duties of a Board of Trade surveyor to inspect the side-lights of steam and sailing ships?—Yes.

707. How long have you been a Board of Trade surveyor?—About 22 years, during which time I have performed duties on the Thames, the Clyde,

*Mr. J. Ramsay.*
25 April 1895.

*Mr. J. Ramsay.*

25 April 1895.

the Mersey, the Tyne, the Wear, the Tees, and at Hartlepool.

708. What was the practice as to the screening of side-lights prior to the issue by the Board of the Instructions to Surveyors 1892? — The screens were placed parallel with the keel at the inner side of the lanthorns, and the chocks, or their equivalent, were of such dimensions that a line drawn parallel to the keel from the inner edge of the lens cut the outer edge of the chock.

709. I presume this was the practice for a great number of years?—Yes, to my knowledge since 1873.

710. Did this arrangement of the screens allow any of the direct rays from the light to cross ahead of the ship?—Yes.

711. What was the angle of convergence of the most extreme rays?—It varied with the different lanthorns; the average was about $4\frac{1}{2}°$.

712. Was there much variation found to exist with different lamps?—Yes, the surveyors in the north-eastern district found the angle to vary from about $\frac{1}{2}°$ to 6°, and in a few cases it was as much as 8° to 9°. I put in a list of lanthorns* of the types made prior to 1892 by various Tyneside firms. These lanthorns, measured by myself, represent a great number which have been placed in the market by the firms in question. The angles vary from 4° to $5\frac{1}{6}°$, and the mean is $4\frac{1}{2}°$.

713. (*Mr. Bolam.*) Are these angles measured from the outside edge of the wick to the chock?—When these lamps are screened so that the inner edge of the lens is in a line with the chock, the angle from the outer edge of the wick is of the dimensions I have stated.

714. I thought you were giving us the angle made by the outer ray across the chock?—Yes, the chocks are supposed to be in a line with the inner edge of the lens.

715. Are the lines drawn from the outside of the wick to the outer edge of the chock?—The average angle is $4\frac{1}{2}°$; they vary from $4\frac{1}{2}°$ to $5\frac{1}{6}°$. You must always bear in mind the distance from the chock to the light is 36 inches, and the chock itself is parallel with the inner edge of the lens.

716. The only question is, whether you take the measurement from the inside of the wick or the outside of the wick?—The outside of the wick; we always deal with the outside of the wick.

717. (*Chairman.*) I see the mean here is $4\frac{1}{2}°$?—Yes, and the wicks were all an inch wide, and were inclined 45° to the middle line. If these wicks had been at 90° the angles would have been larger, but I simply take the wicks as I find them in the lamps.

718. Why is there so much difference in the observed angles?—The construction of the lanthorn in many cases required the wicks to be located between the lens and its centre of curvature in order that the light might be seen two points abaft the beam; and in other cases the wicks were no doubt so placed in order that the light ahead might not be obstructed by the margin of black dirt not infrequently seen around the lens. So far as I know, it has never been the common practice, until the issue of the last revision of the instructions, to require the wick to be placed at the centre of curvature of the lens, nor is this required by the Regulations for Preventing Collisions at Sea.

719. What is the usual construction of side-lights?—I put in a diagram showing an outline plan of the ordinary type of side-light as made in the North-Eastern District prior to 1892. The inside radius of the lens is 5 inches, chord of arc 9 inches, and arc about $128\frac{1}{2}°$. The lens is inclined 45° to the fore and aft middle line of the vessel, and it will be seen on inspection of the diagram that in order to throw the light two points abaft the beam the wick requires to be about one inch nearer to the vertex of the lens than to its centre of curvature. It will also be seen that the outer edge of the $1\frac{1}{4}$-inch wick is transversely 3 inches distant from the inner edge of the lens, also that the outer edge of the 1-inch wick is distant about $2\frac{3}{4}$ inches. These transverse distances are tangents. This type of lanthorn represents about two-thirds of those examined by myself during the time I have been in the Board's service, and it probably also represents about two-thirds of the whole number of lamps supplied in the past to merchant ships and steamers.

720. What is that?—*This* is simply a diagram showing the position of the lens and position of the wicks. Here is another one that goes with it showing the wicks in another direction.

721–3. (*Sir E. Harland.*) An expression was used by the witness "the inner edge of the lens"?—Yes.

724. That the measurement was to be taken from the inner edge of the lens?—The *angle* is now measured from the outer edge of the wick.

725–8. My point is, the witness referred to this inner edge of the lens as if it was an important point, whereas it appears that it is not of the smallest consequence?—Under the old regulations we had to put the screen at the edge of the lens. It did not matter where the wick was. We put the screen at the inner edge of the lens, and consequently the angle varied for every type of lamp. Remember about two-thirds of the whole number of the lamps made in this country were like those I have described. What I wish you clearly to understand is this: that two-thirds of the lamps made in this country were made like that; and consequently the framers of our regulations for preventing collisions at sea made the angle much bigger than it is now.

729–34. (*Mr. Ismay.*) Because of the size of the lamp?—Yes, two-thirds of the lamps, as I say, in this country were made like that.

735. (*Mr. Scrutton.*) What were the regulations?—I have a copy of the earliest regulations which were ever issued by the Board of Trade, and it distinctly says in these regulations that the making of the lamp is to be left to the discretion of the lamp-maker.

736. You do not measure from the lens under the new regulations?—No, not under the new regulations. The screen must be $2\frac{1}{2}$ inches inside the outer edge of the wick.

737–41. (*Rear-Admiral Andoe.*) By the old regulations it was said you were to consider the edge of the wick, and not the edge of the lens. That would make a difference in the screening of the lamp?—Yes, an enormous difference.

742. Why was that?—I believe there was a mistake in the printing of one paragraph; but anyone having any conception of the screening would never have thought it could have been other than an error.

743–6. (*Chairman.*) Are the lanthorns all made the same size?—No, the radius of curvature of the lens, and the number of degrees in the arc vary. I put in a table* giving the dimensions of the lenses of side-lights of three different sizes. The outside radius of curvature of the lens is respectively 5 inches, $5\frac{5}{8}$ inches, and $6\frac{5}{8}$ inches, and the aperture of the lens in each case is 130°. The table shows the transverse distances of the outer edges of the 1-inch and $1\frac{3}{4}$-inch wick respectively, from the forward edges of the lenses, assuming that they are all inclined to an angle of 45°, and that the wick in each case is at the centre of the curvature. The mean distance for the 5-inch lens is $2_{\frac{3}{10}}$ inches; for the $5\frac{5}{8}$-inch lens $2\frac{1}{2}$ inches, and for the $6\frac{5}{8}$-inch lens $2\frac{7}{8}$ inches. The mean of the three is $2\frac{1}{2}$ inches. As these lenses contain only 130°, none of them, when inclined to 45° to the fore-and-aft line, has sufficient range to allow the light to be seen two points abaft the beam, and on that account it would be necessary to place the wick about one inch out of the centre towards the vertex of the lens. This would, of course, make the mean transverse distance for the 5-inch lens about $2\frac{5}{8}$-inches, for the $5\frac{5}{8}$-inch lens $2\frac{7}{8}$ inches, and for the $6\frac{5}{8}$-inch $3\frac{1}{4}$ inches. That is to say, if you take three lenses and divide by three, you get exactly what the

* *See* Appendix 4, No. 2.

* *See* Appendix 4, No. 3.

regulations now require. These transverse distances are the tangents of the angles, and as the length of the screen is 36 inches, the angles are respectively 4° 10′, 4° 34′, and 5° 9′. In this table the lenses are supposed to be lying at 45°, and the wick at 45° and 90°, and so on; and you will notice the mean transverse distance is 2½ inches—which is the distance now required by the regulations.

747. Are all the lenses placed in the lanthorn at an inclination of 45° to the fore-and-aft line?—No, probably in about one third of the lanthorns now in use in the merchant service, the angle of inclination varies from 42° to 35°, depending on the number of degrees in the arc. I put in two outline plans, in one of which the inclination of the lens is about 36° and in the other it is 40½°. This is now the centre of the curvature, that is, the centre of this circle, and you see the whole of the flame two points abaft the beam; that is, the 4° angle away out there forward, and you see the line from *there* to the edge of that wick there; that is all the margin of lens there is to spare; a little bit of dirt on that lens there, would intercept the rays, and it would not get out. In order to get over that difficulty, some of the makers moved the wick a little bit further, so as to get it clear.

748. (*Rear-Admiral Andoe.*) They would have to make the lens longer?—But you cannot, if the lamp is made.

749. Is there any objection to having the lens longer?—No.

750. (*Chairman.*) What we are told is, the lenses are made so, and in order to meet the difficulty they do this?—Yes, I want you to notice that this lens is inclined to 45°, and that to 35°, and you will also notice that bit of brass in the one lamp is twice the width of the brass in the other lamp.

751. (*Rear-Admiral Andoe.*) What is the objection to it?—There is no objection at all.

752. (*Sir E. Harland.*) That is new?—The angle at the inner edge of the lens would be much less in the case of the second lamp than in the first.

753. You do not show the position of the reflector?—No, so long as the radius of the reflector is the same as the distance from the light, you can make it any size you please.

754. (*Rear-Admiral Andoe.*) You say there is no objection to that; yet, if there is any dirt there, it would be a serious matter?—There is no objection so long as the lantern is kept in order.

755–7. What is the proper position for the wick in the lanthorn?—The centre of curvature of the lens.

758. (*Chairman.*) Do you think that the new or 1892 instructions issued by the Board for the guidance of the surveyors are such as to insure uniformity of practice?—Yes, and if makers and surveyors adhere strictly to them, the side lights will be made of a superior type to the majority of those constructed prior to 1892.

759. Do you think it possible to screen a side light to show a uniform and unbroken light from right ahead to two points abaft the beam, and at the same time to confine the light to 10 points of the compass?—No, that is impossible, because when the light is uniform throughout the prescribed range a considerable portion of the rays must cross ahead of the ship; the angle depends to a great extent on the width of the flame.

760. What do you think is the smallest angle which would suffice to enable the light to be seen as required by the regulations?—The angle should never be less than that which would enable the full volume of the light to be seen at a reasonable distance ahead of the ship, when upright and also when heeled to 15° or 20°, either to starboard or to port.

761. What do you consider a reasonable distance?—The shortest distance possible, having regard to the regulations for the prevention of collisions at sea, which require that none of the rays shall cross abaft the stem of the ship.

762. What is the angle of convergence that would suffice under all circumstances?—Not less than 4° when the vessel is upright.

763. Would the angle not be the same when the vessel is heeled?—Not in all cases, because when the ship, the lanthorn, and the screen are all heeled to, say, 20°, the flame tends to remain practically vertical, with the result that what was 4° in the upright position may become 2¾° to 3° for the light on the side to which the ship is heeled.

764. Can you give an example?—Yes, I have a model screen here with the inner edge of the flame in a line with the edge or face of the screen. When the screen is upright the whole of the flame can be seen ahead, but on the other hand, when it is heeled outward a large portion of the flame disappears behind the screen. I brought the model here to show you that the opinion held by some sailors as to what is the correct way to screen a side light is fallacious. They hold that the wick should be screened at its inner edge. The model proves conclusively that this view of the matter is wrong. These sailors also appear to think that the width of the flame is exactly the same as the width of the wick in all cases. I have measured the flames of 1 inch wide paraffin burners and I find that the average width is 1¾ inches in the best type of lanthorn, so that on this ground alone it is manifest that the screen should be some distance inside the wick to allow the whole volume of the flame to be seen ahead of the ship. Some sailors think that the wick should be screened at the inner edge. Now if you look right down you can see the whole of the flame the whole distance, but if you turn the screen over like that you cannot see it at all, the part of the flame that gives light, disappears behind the screen.

765. (*Sir E. Harland.*) But if you reverse it, what then?—Then you get more.

766. (*Captain Thomson.*) What makes the flame go up straight?—The heat above has the tendency to make it go up straight.

767. (*Mr. Ismay.*) I suppose you think sailors ought to have their own way?—Sailors always have their own way in everything.

768. (*Chairman.*) What allowance would you make to provide for the heel of the ship to 15° or 20°?—It should not be less than the height of the flame multiplied by the sine of the angle of heel, but the exact value could only be accurately determined by experiment.

769. But the Board of Trade have fixed the angle of convergence for the most extreme rays at 4°?—Yes, they appear to have been desirous of keeping the angle as fine as possible consistent with the due observance of the regulations for preventing collisions at sea, and on that account they decided, after Sir Digby Murray made a series of carefully conducted experiments, that the angle of convergence should not be less than 4° when the vessel is upright, which, in my opinion, gives 2¾° to 3 degrees, when the lanthorn is depressed 15° or 20°.

770. Do you think this is a satisfactory arrangement?—Yes, at any less angle than 4° the light would not be uniform throughout the range.

771. Why do you think so?—All the results of experiments which I have seen indicate conclusively that the minimum angle of convergence in the upright position must not be less than 3°, in order to show a nearly uniform and unbroken light throughout the range; it is therefore evident that if the light is also to be uniform when the vessel is heeled, the angle in the upright position should not be less than about 4°. The flame of a 1¼ inch colza burner is about 1⅜ to 1⅞ inches wide. If it be screened at its inner edge, and parallel with the keel, the angle of convergence is about 3° when the vessel is upright. In this case the full volume of the light is thrown barely ahead of the lanthorn, while to comply strictly with the regulations it should be thrown ahead of the ship; it would therefore seem, apart from experiments, that the 4° angle is as fine as it is possible to attain in order that the full volume of the light may be seen ahead at all inclinations of the ship which are likely to occur in practice.

*Mr. J. Ramsay*
25 April 1895.

772. (*Sir F. Evans.*) Might I ask what is the height of the flame?—I have measured several, and they seem to range about $1\frac{3}{4}$ to 2 inches, whether they are paraffin or colza.

773. Vertically?—Yes.

774. (*Captain Castle.*) That is the flame?—Yes, so that if the lantern were heeled 20°, and you take the height of the flame as the correct way to deal with it, then the height of the flame multiplied by the sine of 20°, gives half an inch, so that you get $1\frac{7}{8}$ inches plus half an inch as the distance from the outer edge of the wick to the screen, or nearly $2\frac{1}{2}$ inches.

775. (*Chairman.*) Of course all heeling is only as the vessel rolls?—If it were only the rolling of the vessel I do not think it would matter. Suppose a steamer leaves New Orleans carrying a homogeneous cargo: she is probably rather a narrow ship for her depth, and when she starts she is probably stable enough; but the firemen are daily working the coal out of the bunkers below the water-line; this tends to raise the centre of gravity of the ship and her lading until it approaches the same height as the metacentre, and she takes a heavy list. You can understand a ship leaving New Orleans under the conditions assumed goes steady enough at first, but taking the coals out of the lower bunkers every day, by and by she gets a good big list, and the light on the lee side of the ship ought to be screened so that it can be seen ahead of the ship in that condition, or it is no good.

776. (*Mr. Ismay.*) Are the worst cases found amongst vessels going from the Baltic with deals?—There are some of those very bad.

777. (*Captain Castle.*) And the vessels from the Mediterranean?—Yes.

778. (*Mr. Ismay.*) And the small steamers going to the Mersey?—Yes, and very often one sees ships coming into the docks with a considerable list.

779. (*Captain Castle.*) But a ship leaving port perfectly right, and getting the wind during the course of the voyage, would take a natural list?—Yes, if the cargo is such that it moves.

780. Do you think that at the time the Regulations for preventing Collisions at Sea were first issued, it was intended that the side-lights should both be seen ahead of the ship?—Yes, the Regulations published in June 1848 by the Commissioners for executing the office of Lord High Admiral of Great Britain and Ireland, &c., distinctly state that the side-lights are to be fitted with inboard screens at least 3 feet long, to prevent them from being seen across the bow. The screens to be placed in a fore and aft line with the inner edge of the side-lights, as is to be seen in the "Nautical Magazine" for August 1848.

781. What angle of convergence would this give?—With ordinary side-lights, $9'' \times 9'' \times 11''$, screened in this way, the angle of convergence would not be less than 5° to 6°, and in some cases it would be more, probably 8° or 9°.

782. (*Mr. Bolam.*) Of course it might be much less?—I do not think it would be much less than 5° or 6°.

783. (*Captain Thomson.*) That is not in the Regulations itself?—I think so.

(*Mr. Bolam.*) Yes, I have it here; the screen to be placed in the fore and aft line "with the inner edge of the side-lights. But those words, "with the inner "edge of the side-lights" dropped out.

(*Chairman.*) They were dropped afterwards certainly.

784. What did you say was the probable angle of convergence under this rule?—5° to 6° probably, in some cases as much as 8° to 9°, certainly not less than 5° to 6° with any lamp that has ever been made.

785. How long did that continue to be the practice?—I cannot say definitely; but there is an article on the rule of the road in the "Nautical Magazine" for November, 1851, in which the wording of the paragraph, relating to screening is precisely the same as that referred to in my previous answer. I have a book of instructions here, issued by the Board of Trade in 1855, and, so far as I know, it is about the earliest book of instructions issued, and it is the only copy I ever saw. In this book, not only have we instructions about the screening; but we have the pictures that the Admiralty issued with the regulations.* Now, these pictures show distinctly that it was not intended that the lights should only cross a long way a-head, and in paragraph 87 there are instructions about fixing the side-lights.

786. "87.—The manner of fixing the coloured light "is to be particularly attended to. They should be "fitted each with a screen of wood on the inboard "side in order to prevent both being seen at the "same moment from any direction but that of right "ahead. 88.—This is important, for without the "screens (a principle first introduced with this plan) "any plan of bow lights would be ineffective as a "means of indicating the direction of steering. "This will be readily understood by a reference to "the preceding illustrations, where it will appear "evident that in any situation in which two vessels "may approach each other in the dark the coloured "lights will instantly indicate to both the relative "course of each; that is each will know whether "the other is approaching directly, or crossing the "bows either to starboard or to port. This in-"timation is all that is required to enable vessels "to pass each other in the darkest night with almost "equal safety as in broad day, and for the want of "which so many lamentable accidents have occurred. "It is left to all persons concerned to furnish "themselves with whatever description of lantern "they may see fit to adopt, provided always that "the above conditions are fully and effectually "carried out." Now here are the lights, and these lights show that it was intended that the light should be shown across?—This is what was intended. Steamer B sees all three lights of A. Unless the rays cross the bow, he could not see all three lights.

787. But these vessels are right ahead of each other?—Then you see both lights. If the rays do not cross the middle line you will not be able to see both lights. If you were to screen lights parallel with the outer edge of the wick you would require to stand out at least 3° from each bow before you would see them.

788. I do not know that much is to be gathered from those illustrations?—These are the illustrations published by the Admiralty in 1851 and are copied by the Board of Trade. Look at that paragraph there, No. 90.

789. "It is left to all persons concerned to furnish "themselves with whatever description of lantern "they may see fit to adopt, provided always that the "above conditions are fully and effectually carried "out"? In 1851 it was left to the lampmakers to make any kind of lamp they liked. After some years directions were added that the lanterns were to be not less than $9'' \times 9'' \times 11''$.

790. Do you refer to this as showing that at that time it was considered that the lights should cross ahead of the bow?—I think these instructions clearly indicate that the lights would be seen a considerable distance across—much more than 4°.

791–2. (*Chairman.*) You may be right, and that may be the inference. But it does not agree well with these words: "They should be fitted each with a screen "of wood on the inboard side to prevent both being "seen at the same moment from any direction but "that of right ahead?"—At any rate what was in the mind of the Board of Trade some years ago was that the side-lights were to cross at some distance ahead. I have a copy of the "Rule of the Road," here by the late Mr. Thomas Gray, and this is what he says.

793. "As I know the rays of the side-lights must "in every ship cross at some distance ahead, I ought "to find out what that distance is in my ship, so that

* *See* Appendix 1, No. 1, and Questions 249–252.

"I may know how far on each of my bows a ship "nearly ahead will see both my side-lights. This "is very important, as I shall appear to be end-on "over the whole arc within which both of my lights "are seen; and I must bear it in mind on seeing "another ship fine on either bow." No doubt you are quite right in saying that this shows that in the mind of the person who wrote it the side-lights were to cross at some distance ahead?—And then he gives a description of the diagram.

794. "In the following diagrams the black lines "represent the rays of the red light, and the dotted "lines the rays of the green light. Within the triangular "black space ahead of the ship neither side-light can "be seen, but both can be seen ahead of it, within "the arc, covered by the crossing rays, and I therefore "know that another ship, when within that arc ahead "of my ship, can see both of my side-lights, and that "I shall appear to be end-on to her"?—Yes.

795. (*Sir F. Evans.*) What is the date of that?—The fourth edition, 1884.

796. What is the name of the book?—"The Rule "of the Road at Sea." There is another very interesting thing in this book. There are the pictures in connexion with the green to green and red to red rule. I think that is very interesting. It says "When "all three lights I see ahead, I port my helm and "show my red," and then there are two ships crossing,—"Green to green or red to red, perfect "safety go ahead." The writer must have contemplated a convergence of 4° or 5° at least.

797–8. (*Chairman.*) There can be no doubt that the Board of Trade in 1884 contemplated the lights would cross?—There can be no doubt about that. I never contemplated anything else. I may say that during the 16 years I was at sea I saw side-lights taken out and put in; and I saw the lens project outside the screen; but it never entered my mind to think or calculate what was the angle of convergence of the rays. Now, what was my experience is that of every sailor who goes to sea now, and sees those lights; he has no more conception as to the angle at which the extreme rays cross ahead of the ship than I had.

799–807. (*Rear-Admiral Andoe.*) Do you think the 4° is a fair compromise?—Yes. I do not say it because I am a Board of Trade surveyor. I think it was a happy selection to make it 4°. It seems to allow for heeling and everything else, and if there is any change at all, I think it ought to be an increase and not a decrease.

808. (*Sir E. Harland.*) It ought to be more than 4° if anything?—More than 4° if anything. That is my conscientious opinion in the matter.

809. (*Rear-Admiral Andoe.*) As to the question of the rays, do you think that seamen were aware the rays did cross?—I think they did not know anything about it. I was going to say I think that two or three men, who were fond of writing, had something to say in the matter, and all the rest thought it was a good thing to go upon. That is my opinion. I do not believe myself now that one sailor in ten ever carefully measured a lanthorn in his life. If I took a lanthorn to him and said, "Now, what is the relation between "these curves and the centre of the flame?" I do not believe he could tell me.

810. He could not tell you what the angle was?—I do not believe he could tell me what was the difference between *this* side *here*, and *that there*. Sailors are like other men. Unless they pay special attention to some particular subject they know nothing about it. I am the same. If I do not read up a subject I do not know anything about it. We are all the same, every one of us.

811. (*Sir F. Evans.*) Take the case of two ships approaching one another, each seeing the other's three lights?—It is the duty of each to put the helm hard-a-port.

812–3. If they are 2,000 feet apart you have only a little over half a minute before they meet; they each see all three lights and port, but they go into one another because they cannot get out of the way?—That is an example of the necessity of the lights crossing at big angles.

814. (*Mr. Bolam.*) The more you screen the lights the worse the case?—I do not think so.

815. You would give them a larger angle?—Yes.

816–8. You are not a sailor?—No. I am an engineer. Here is another diagram. Here is a ship, like the "Teutonic" 60 feet beam, and 560 long. She has colza burners $1\frac{3}{4}$ inches wide, and both lights are screened to 4°. Now at two miles from the lights the width of the field where the *full volume* of the light is seen is 440 feet.

819. (*Rear-Admiral Andoe.*) 440 feet?—Yes, 440 feet. So if we put the "Majestic" at right angles to the "Teutonic," at this distance of two miles, all the people on board the "Majestic" will not see the full volume of both lights of the "Teutonic." A man at the stem would only see the red light, and a man at the stern would only see the green light.

820. You do not say the green and red are the same power. Is it not a positive fact, that one is very much stronger than the other?—Yes.

821–2. (*Chairman.*) Assume them to be of equal strength?—The officers on the bridge of the "Majestic" could see both lights of the "Teutonic," if they were of equal brilliancy; but the man on the forecastle could not see them both, if the lights converged at an angle of 4° That is the way to look at the problem.

823. (*Mr. Bolam.*) This is only the inner rays—not the full volume?—I have dealt with this question of the intensity of the lights in a diagram. The $1\frac{3}{4}$ inch wick is supposed to be divided into a number of equal parts, and the light from each dealt with separately as shown in the curved lines on the diagram I have here. An observer walking along the curved line is supposed to see light of the same intensity as he would see if standing on the middle line at the limit of the two miles range.

824. That is the actual power of the light?—If you take the full volume of light as seen at the two miles range, then as you walk along the curved line, you gradually cut off the light, because you are getting behind the screen.

825. (*Sir E. Harland.*) You are getting nearer?—Yes, so as you go along you gradually cut it off.

826. (*Rear-Admiral Andoe.*) You are cutting it off in volume, but increasing in intensity, as you approach it?—Yes.

827. (*Mr. Bolam.*) If you take the ordinary type of wick that would be very much wider?—Yes.

828. (*Chairman.*) You were kind enough to tell us your experience at sea. Perhaps you would let us know what position you held?—I was most of the time chief engineer. I have been in all types of ships, from ships carrying two engineers to ships carrying seven, and when I left the sea I was chief engineer on one of the largest ships in the North Atlantic passenger trade from Liverpool.

829. (*Mr. Bolam.*) You said that the average screening in the North of England was $4\frac{1}{2}$°?—Yes, $4\frac{1}{2}$°.

830. And that the minimum screening was 1°?—Half a degree, I think I said.

831. And the maximum about 9°?—From $\frac{1}{2}$° to 6°, and in some cases I said it was from 8° to 9°—in a few cases.

832. Then the $4\frac{1}{2}$° is not just a mean of the highest and lowest of the angles?—It is, taking the whole of them together, and adding them up and dividing them by the arithmetical number.

833. The arithmetical number of what?—Of the whole number of ships dealt with. I have a list of ships here and the surveyor's report of them.

834. Did you mean to put this in?—I think that these have been put in before. I am not sure.

835. (*Chairman.*) We have had a copy of them, I think*?—Yes.

836. (*Mr. Bolam.*) Does this contain it?—(*Report handed to the witness.*) No, this does not.

* *See* Appendix 4, No. 1.

*Mr. J. Ramsay.*

25 April 1895.

837. Could you put the manuscript in?—It is only a press copy, but I can put it in.* The originals I sent to the Board of Trade some time ago.

838. (*Captain Hallett.*) Can you tell me whether lenses are quite a circle?—A circle in all the cases I have measured.

839. Practically, a true circle?—Yes, when they are cast. In cooling they may alter a little, but they are practically a circle.

840. Are they manufactured in that way or in cylinder, and then cut?—I believe the fish globes are made into globes and then cut into three lenses, each containing 120°.

841–2. They are true circles?— Yes.

843. Those old regulations you spoke of as having been drawn up by the Admiralty, were they drawn up for the guidance of Her Majesty's ships only, or for general use?—The Admiralty dealt with the rule of the road at the time, and I suppose they were drawn up for the guidance of ships generally.

844–5. (*Captain Thomson.*) Tell me what you understand by the expression "ten points from right ahead"?—From two points abaft the beam.

846. Ten points—from two points abaft the beam to right ahead?—I think the exact meaning of it is that the whole of a light should be seen from ahead of the stem of a ship to two points abaft the beam, if you are able to do it. The full light ought to show from right ahead of the stem to two points abaft the beam. It ought also to be uniform over the whole ten points, and if you have uniform light over the ten points some light *must* show beyond the ten points.

847. (*Chairman.*) I do not know why you say that?—Because it says "ahead."

848. That does not mean ahead of the stem, does it?—Yes, I think so, when you read that none of the rays are to cross the bow of the ship.

849–50. (*Captain Thomson.*) Would not that give you more than ten points of the horizon?—It would be ten points if you took it from the middle line of the ship.

851. The side-light is never placed on the stem?—It does not matter where the side-light is placed; you reckon the ten points from the fore-and-aft middle line of the ship, and to comply strictly with the regulations every bit of that light must be equally intense; and you cannot do this without allowing some rays to cross the middle line; it is a physical impossibility.

852–3. (*Chairman.*) Does it not suggest to your mind, as it is a natural impossibility, that possibly the rule does not mean right ahead of the stem?—Well, I think that those who drew up these rules meant that both lights should be seen ahead and seen well ahead and they added screens so that none of the light should show across the ship itself. That is my view of the matter—that they never fixed in their own minds any particular angle.

854. (*Rear-Admiral Andoe.*) What do you mean by well ahead?—Whether you are close to a ship or far away from the ship, you would be able to see both lights equally well.

855. (*Captain Castle.*) You mean straight ahead?—Yes. Whether 500, 600, or 700 yards away from the ship you would see lights of equal intensity.

856. (*Rear-Admiral Andoe.*) Not within 10 yards of the ship?—No, I do not suppose they intended anything of the kind.

857. (*Captain Thomson.*) I thought you would recognise that right ahead was a given direction?—So I do. I take right ahead to mean right ahead of the ship.

858. Is not "right ahead" a given direction from the position of the lantern?—That is where the difficulty is; some people think it is right ahead of the lantern, but it is not; it is right ahead of the ship.

859. As to screening when the ship lists. You have given an instance of the relative alteration in the direction of the flame in the lamp when the ship lists. Has it ever occurred to you there is another cause for the alteration of the angle of screening due to list? Supposing you have a ship, say, 200 feet long, drawing ten feet more water aft than forward. Is it not a fact that if she lists 20° it will alter the angle of screening 1°?—I never looked at it in that way.

860. And if she lists 20° you will alter the screening 1° outwards on one bow, and inwards on the other?—If it is the opposite way from the wick, perhaps it will go to the other extreme.

861. (*Captain Castle.*) That would be rather an extreme case?—Yes.

862. (*Captain Thomson.*) A ship 200 feet long, drawing 10 feet more water aft than forward?—That is an extreme case.

863. This is not an extreme case in the channel?—You would not be allowed to leave the Tyne like that—they would be looking after you.

864. Do you not think the flame takes the direction of the draught up the funnel of the lamp?—I examined several lights at North Shields and I found that the colza flame behaved in practically the same way as a candle; but the paraffin flame appeared to remain more upright; and a gas flame with a good pressure under it goes nearly straight up. You do not see any change. It is burning under pressure. Paraffin also seems to be burning a little under pressure, but it does not remain so upright. But you have to deal with the worst cases—that is the ordinary colza, and screening must be uniform.

865. As a matter of theory we can say the lower the flame the more vertical it will go up, and the higher the flame the more it will tend in the direction of the funnel of the lamp. It does not go straight up?—I do not know anything about that.

866. Can you tell me if the ships you mentioned—those whose screening you investigated, were they all ships surveyed by the Board of Trade?—The ships I have given in now are ships that the surveyors visited in the ordinary course of duty, and they found them screened in that way, and had them altered to 4°.

867. Can you give me any idea what proportion those ships bear to the total number sailing out of England?—No, I could not, although we have a very big experience in the north-east district. The year before last I think, there were 30,000 ships cleared from the North of England—30,100.

868. I want to know how many of them were visited by the Board of Trade officials?—Of new ships last year the tonnage was 10,000 ahead of all the other ports of the three kingdoms. Fifty-two per cent. or 50 per cent. of the whole of the new tonnage in the three kingdoms was built in the north-eastern ports last year. So the surveyors had 50 per cent. of the new inspections.

869. Is it not a fact there were a great number of ships of which the Board of Trade surveyor knew nothing as regards the side-lights?—I do not think there are many escape the Board of Trade surveyors. They are always going round, and they are very active officers, and they like to do their duty.

* *See* Appendix 4, No. 1.

*Capt. A. J. G. Chalmers.*

Captain ALFRED JOHN GEORGE CHALMERS called and examined.

870–1. What office do you hold?—I am Principal Officer of the Board of Trade for the South Wales district.

872. That includes the Bristol Channel ports?—Yes.

873. How long have you been in the Board's service?—Over 17 years and a half.

874. How long have you held the office of surveyor?—Over 14 years and a half.

875. And before that were you a seaman?—Yes, I was about 18 years at sea.

876. In what capacity did you serve?—All capacities.

877. As master?—As master and officer of sailing ships and steamers, of various sizes and in all trades.

878. I think you have given consideration to the Regulations for Preventing Collisions, have you not?—Yes.

879. What is your view of their intention as to the converging of the rays of the side-lights?—My view is, and I have uniformly read the regulations as being directed to this: that the side-lights should so converge ahead of the ship as to be seen within easy distance of the ship itself, in the line of direction of the ship's head.

880. Will you just explain that a little, as to your view that the lights should cross at a certain point?—They should converge and necessarily cross. They must cross if they converge. I have always understood that they must converge because they have to be visible right ahead of the ship. I have always taken it that the words "of the ship" were understood after the words "right ahead."

881. "Right ahead" you have always understood to mean right ahead of the ship?—I have always understood it to mean right ahead of the ship. The words "of the ship" seem to be understood at a great many places throughout the regulations.

882. Now, practically, what have you considered to be the instructions to the surveyors during the time of your service in the Department?—The instructions have all along been uniform since I have been in the Department; we were directed to put a chock at the fore end of a 3-feet screen which was placed parallel with the ship's keel, and that chock was to be equal in thickness to the distance between the inner edge of the lens and the face of the screen; and the instructions told us, if we did that, we ensured the rays crossing at a proper distance ahead.

883. You consider that in the majority of cases the old rule worked out to the same result as the new one?—Yes; all the 9-inch lanterns that have been in use for the last 25 years approximated so closely as to be practically the same thing.

884. I see you work it out with a 9-inch lantern, and find the distance from the back of the lamp to the outside edge of the wick to be from 4½ to 5½ inches, and the distance from the back of the lantern to the inner edge of the lens 2 inches, and then you find distance the light travels inboard in the 3 feet to be from 2½ to 3½ inches?—Yes.

885. And that you find works out at an angle of convergence from 4° to 5½°?—Yes.

886. As to the plan of screening to the inside of the lens—did you find the angle of convergence was a variable one?—Yes.

887. Why would that be?—Because the distance from the back of the lamp to the outside edge of the burner varied. In some lanterns it was 4½ inches; in others 5½ inches.

888. Did the great bulk of the lamps that were in use give the result that I mentioned to you just now?—Yes, the large majority of the lamps gave a resultant angle of from 4° to 5½°—5½° outside—4° inside

889. Since 1892 the angle of 4° has been laid down as the angle to be adopted; what has been the effect of this screening in the South Wales district?—In the South Wales district, we found from 12 to 13 per cent. of the vessels were less than 4°. The remainder were from 4° ranging sometimes to 9°, from 4° to 6° was a common angle. We have had them 9°; and we have had them up to 12°.

890. I believe you have not got, have you, any tabulated records copied out at full length?—No, we did not keep them. I am simply quoting the verbal and written reports from the surveyors to myself, but we kept no tabulated records *in extenso*, as we did not consider them necessary.

891. What did you find as to the knowledge of masters and officers of vessels—did you find in your experience that they were aware of what in fact the screening angle of their side-lights was?—They were quite unaware of it. The bulk of the deep-sea men, I may say, stoutly contended that the lights should never converge; that they were never intended to converge by the regulations, and that they do not actually in practice converge. On the other side, the coasting-men, who were having object-lessons every night about it, quite understood the affair, and they one and all thought and contended that we were doing the right thing, and that we were simply making the arrangement of lights which had been so general for the last 35 years, uniform.

892. Did you talk the matter over with any of the deep-sea masters?—I was compelled to, because they were coming in almost every day from the beginning of 1892—for about 8 or 12 months. It took me nearly half my time—I should say three out of my six official hours of the day were taken up in arguing the point with them.

893. What did you find the result of the argument? Did you convince them?—We did convince them by an actual object-lesson, but nothing short of it. We went on board; in many instances, I went myself, and I took the angle at which the lights were then screened, and in nearly every case where they had come and said that the lights did not even converge, we found them crossing at an angle of 8° and 9°. When we screened them properly, and went down at night time and lit them, we then proved to them, we had drawn the angle in—sometimes 4°, sometimes 3°, sometimes 2°. Then they saw that the alteration was making for safety, and at once they were compelled to go back from their contention that the lights never converged, and to say that they had really erred in ignorance, and that they had not read up the question, or had not gone into the question; I ascribed it to the fact that they had simply 18 hours channel work at the beginning of their voyages, then four months at sea, and then on their return another 18 hours.

894. Are you referring only to sailing ships?—No, to the steamers going through the Canal also.

895. There are lots of ships in the Mediterranean?—Yes, but the Mediterranean is very broad and not like the coast.

896. (*Chairman.*) Did you find any cases where the screens where longer than 3 feet?—In the bulk of the vessels I have quoted where the screening was less than 4°, it was owing to the screens being more than 3 feet long, in some cases 4 feet. These had chocks at the fore-end equal in thickness to the distance from the face of the screen to the inner edge of the lens which, of course, made the angle finer, but we seldom found a 3-foot screen that had a finer angle than 4°.

897. Now, as regards foreign vessels, foreign sailing vessels, how do you find that they screened their lights?—Well, under our instructions we are not allowed to interfere with foreign vessels. All we are supposed to do is to go on board of them and observe what lights they carry, and how they are screened, and, if necessary, advise the people on board that their lights are wrong, or else we advise the consular officer; but I do not think I have been on board a single foreign sailing ship whose lights have been screened to less than 10° for the simple reason that none of them put any chock at all on the end of the screen. They simply have the screen parallel to the line of keel, and that gives an angle of from 10° to 12°.

898. And now as regards steamers?—The steamers are practically screening their side-lights the same as ours, and during the last 18 months the French, German, and Norwegian steamers seem to have all screened their side lights practically to 4°; that may be said of nearly every French, German, and Norwegian that we boarded for the purpose of our own information. One week, at Barry Dock, of those we saw—two were French, one German, and three Norwegian—and four out of the six were screened to 4°, one to 6°, and one to 3°.

899. They were all steamers?—Yes.

*Capt. A. J. G. Chalmers.*

25 April 1895.

900. Now, let me ask you a question as to your experience as a seaman—what have you found seamen of experience think ought to be the screening of side lights ?—Well, from my experience as a seaman, it appears to me that the practice that has been in vogue during the last 30 years or more than that—35 years, is what we are making uniform, and that is the practice that makes for safety. I just want to explain that in the vessel I served in, when I first went to sea, we were taught this. There was a written instruction to the "look-out," which was posted up both in our house, in the forecastle, and in the officers' quarters as well, that if you are on the look-out, and you sight anything within a point on the bow, you were to report in this way: if it were a light within a point on the starboard bow "light right ahead to starboard;" but if it were more than a point on the starboard bow you were to report it as "light on the starboard bow;" that was my experience as a seaman, and of course it grew into my mind as a seaman, that anything within a point on either bow was described as "right ahead" to starboard, or right ahead to port. All the sailing ships in those days I believe had a compass painted on the capstan-head; and, at night-time, there was always a notch in the rail or a particular stanchion picked out which gave you the bearing when you stood beside the capstan. Everything within the range of a point on each bow we treated as right ahead; and my experience is that it has grown into the mind of the seamen that everything within a point on either bow is described as right ahead; and as the lights were screened so as to show within that limit, not so far as a point on either side—I think it was an indication if you sighted a light on that bearing that it was practically right ahead, and you had to abide by the rule of the road for a vessel meeting end-on or nearly end-on.

901. Of course 4° would not give a point or anything like a point ?—No. That is 7°-15′ inside of the outside limit.

902. So that, speaking as a seaman, you would have no doubt if you had two lights within say 4°, it would be your duty to port ?—It would be my duty to port—to treat the vessel as one coming end on, or nearly end on.

903. (*Sir E. Harland.*) I think you referred to the inner edge of the lens. Have you in practice gone by the centre of the wick, or the side of the wick, when you are fixing this angle of 4° ?—Since the Order in Council do you mean ? What we did a few years ago had no reference at all to the position of the wick. We simply made the chock equal in thickness to the distance between the face of the screen and the inner edge of the lens.

904. Up to that date you went by the inner edge of the lens ?—Entirely, the wick was never mentioned in connexion with the screening. I may state that when I say the wick was never mentioned in connexion with the screening, I mean never authoritatively mentioned. In paragraph 178 of "the Instructions to Surveyors," dated 1875 (the first copy of Instructions I received), the word "wick" does occur, but it is so palpably at variance with the previous context and the accompanying diagrams, that I clearly recollect asking my seniors as to its real significance, and must have been told it was a printer's error, as I find I erased it, and substituted the word "lens" in the copy of Instructions I was then using.

905. And you think that in consequence the thickness of chock varied as much as an inch ?—As much as an inch.

906. And therefore that altered the angle of crossing the bow ?—Yes, roughly speaking from 4° to 6°.

907. From what date have you gone by the wick ?—Since 1892.

908. So that now you do not deal with the inner edge of the lens ?—Yes, but not to regulate the screening.

909. You do not deal with it unless you find the inner edge of the lens was such as to become a positive objection from the ray of the light of the wick of the chock ?—That is so.

910. (*Mr Bolam.*) If no records were kept, and you only give this return from verbal and written reports of officials, how do you make the per-centage so accurate ?—I used to tot them up every two to three months in pencil for my own information.

911. (*Captain Castle.*) Speaking of these foreign sailing ships in your district; there is a great want of uniformity in the side lights, is there not ?—A great deal; some of them have the screens pointing outwards lashed to the rigging, giving an outward angle instead of an inward one.

912. (*Captain Thomson.*) When these new regulations came out, did you visit more ships than before ?—I do not think so. We always have a certain number of surveyors in the port told off for what we call miscellaneous duty, and they go over all the vessels for the inspection of their lights, &c.

913. They go on board the vessels to see their side lights are in order and their screens ?—Yes, it is one of the most important duties surveyors have to perform.

914. Does that apply to all vessels ?—All vessels, from the transport to the coaster.

915. (*Sir F. Evans.*) Here are two approaching vessels (*pointing on the diagram*) and they each see all three lights ?—Yes.

916. That is taking it at 4°; what would a man do who was in charge of those ships ?—Port his helm.

917. Where would they get to ?—Well, if it were a narrow channel it would never occur, for the simple reason each man would be on his own side of the channel.

918. In the open sea ?—Then he would port at least a point. We never port less than that practically.

919. I have taken two ships; they are going at the speed of 18 knots, and they are 2,000 feet apart ?—Yes.

920-1. If you put your helm hard-a-port in each case they would meet exactly in the centre, because neither ship could get out of the other's way. If you ported in each case those vessels must collide. This is a distance of 2,000 feet ?—That would never arise practically, because the lights would have been visible when each ship was a mile distant from the other.

922. Not in thick weather ?—Then they have no business to go full speed, and such a case could never arise with proper seamanship.

923. (*Mr. Ismay.*) Have you not a good many Liverpool ships visiting the South Wales district ?—I cannot say we have.

924. Ships loading coals from Cardiff and other ports to India and China ?—Not many registered at the port of Liverpool. Some of these large steamers which were built at Belfast have been recently coming in.

925. There is a return put in that 43 ships of those examined were screened to 4° ?—Yes, possibly that would be due to the length of screen—the Liverpool ships coming to Cardiff are those very large ones that have been built very recently, but as a rule we get very few Liverpool registered vessels there.

926. The bulk of the ships registered there belong the Knight line ?—The Knight line; they are screened to 4°, and I think before they were a little coarser. They were 5°. I am quoting from memory, and am not quite certain.

927. What I am putting is that there were 43 per cent. of the ships examined at Liverpool as against your 10 ?—12 to 13 I make it. Our per-centage is largely swelled by the bulk of the ships from the north-east coast, viz., from Hartlepool, Sunderland, the Tyne, Middlesbro', Cardiff itself, and Swansea. They form the bulk of the ships that come to Cardiff.

928. We have had the Board of Trade surveyor, and he says they are very perfect in all their examinations ?—The north-east coast ships are all of the same type—the ones that we have dealt with. Before

we gave them the 4° angle we found them over the 4°. Now we find them at the 4° uniform.

929. (*Sir F. Evans.*) As a practical seaman, if it were practicable, would you like to see a dark lane?—Certainly not.

930. Considerably in advance of the ship?—Certainly not. In narrow waters it would be particularly disastrous. I am speaking now with a considerable experience in the coasting trade. I left big ships for a time at a very early period on purpose to get experience on the coast. I went into colliers, and I went as mate and then as master, the first part of my career, and my experience is that the 4° angle decidedly makes for safety in narrow waters.

*Capt. A. J. G. Chalmers.*

25 April 1895.

931. You think the 4° is the best compromise?—Yes.

932. (*Chairman.*) You were speaking about a diagram?—Yes, this is the diagram we had, and I found it saved me very much talk. (*The witness explained the diagram.*)

---

## Wednesday, 1st May 1895.

PRESENT:

THE RIGHT HON. SIR FRANCIS H. JEUNE IN THE CHAIR.

| | |
|---|---|
| Rear-Admiral ANDOE. | SIR EDWARD HARLAND. |
| Captain WILSON BARKER. | Captain HALLETT. |
| Mr. BOLAM. | Mr. ISMAY. |
| Captain CASTLE. | Mr. SCRUTTON. |
| SIR FRANCIS EVANS. | Captain THOMSON. |

Mr. C. HIPWOOD, *Secretary.*

Mr. ARTHUR NORMAN HILL called and examined.

*Mr A. N. Hill.*

1 May 1895.

933. (*Chairman.*) I believe you are the secretary of the Liverpool Steamship Owners Association?—Yes.

934. I understand that you have been appointed to give evidence before us as to your association's views with reference to the screening of side-lights?—Yes.

935. What is the tonnage of the vessels entered in the association?—1,588,312 gross, and 996,732 net.

936. What class of vessels do members of the association own?—I think every class of vessel. All the principal lines, the mail, passenger, and cargo lines trading out of Liverpool, in addition to which we have a number of tramp steamers in our association, and the coasting lines trading regularly in and out of Liverpool are also members.

937. Have you a list of the members giving any further particulars of the vessels owned by them?—I have it in the Annual Report for 1895 of the association; it shows the tonnage entered by each member, and the class of trade in which they are engaged.

938. What is the view held by your association as to the manner in which side-lights should be screened?—The view is that there should be international agreement upon the system which is adopted, and the association thinks that that system should be to screen the lights so as to show from two points abaft the beam to as nearly right ahead as may be possible—every precaution being taken to minimise the crossing of the lights as much as possible.

939. Why does your association object to the crossing of the side-lights?—In their view they think the crossing leads to mistakes as to the position of the vessel showing the lights that are crossing; and further that the crossing of the lights is destructive of their use for indicating quickly a change of course or change of position of the vessel which is showing them.

940. Do you think that the Order in Council of January 1893 has, in fact, increased the crossing of the lights?—That is certainly the view of the association.

941. But has it not also on other vessels diminished the amount of crossing?—Yes; we believe that to be so from the inquiries we have made.

942. But if that is so, and the crossing of the lights is so objectionable, how is it that the shipowners did not protest against the practice before the Order in Council of January 1893?—Well, speaking for my association, I say that until the Order in Council of 1893 was made, the shipowners had not realised fully how much the screening which was being adopted by the Board of Trade permitted the crossing of the side-lights; but it was the fact that the Order was passed, or the fact that the Board of Trade issued regulations immediately preceding the passing of the Order which first drew the shipowners' attention so prominently to the crossing.

943. Did they then regard the order of the Board or Trade as a departure from the letter of Article 3 of the International Regulations?—Yes.

944. What did they understand the rule in Article 3 to be before the Order in Council?—That the lights were to be so screened as to prevent their being seen across the bows of the ship.

945. What do you understand by "crossing the bow"?—Not only across the actual bow of the ship, but also across the line projected ahead of the ship from the bows.

946. As a matter of fact you now find that that rule was not observed?—Not always; but there was considerable difference in the practice of the surveyors. Some surveyors screened so as to prevent as much as possible the lights from crossing. Whilst others made them cross immediately ahead of the ship.

947. Do you think that the shipowners have suffered from this practice?—That is the opinion of the association. They think that very many ships coming into collision have come into collision owing to a mistake being made as to whether or not the other ship was going to obey the rule of the road, and they think that that mistake has been caused in many cases, especially in narrow channels, by the crossing of the side-lights.

948. I understand you to admit that the Order in Council may have brought about a more uniform practice?—That is so; but we think that it has not brought about the right practice.

949. If there is no crossing, is there danger from an unlighted space ahead of the ship?—The members of my association have never heard of such a danger existing.

950. But may not that be because in fact the lights have always crossed as much as they now cross?—I

*Mr. A. N. Hill.*

1 May 1895.

think not, because on many vessels they used to cross much less than they now cross under the Order in Council.

951. You attach great importance to the side-lights indicating the change of course, or the direction of the vessel?—Yes; the greatest possible importance.

952. Do you think that anything else should give way to that consideration?—No; I think everything should give way to that consideration. The masthead light indicates the presence of the vessel, and everything should be done to make the side-lights indicate as promptly as possible any change of course.

953. Have you any precise suggestion to make as to the best mode of screening?—No; the association do not offer any precise suggestion. They want such screening as will permit of the lights covering the ten points, and they also want to prevent, as far as possible, the crossing of the lights.

954. You also, I understand, attach equal importance to the system that is adopted being made international?—That is so.

955. Does your association consider there is at present international agreement?—Not since the Order in Council of January 1893.

956. But there was before?—Yes.

957. Why do you say that the Order in Council affects the international agreement?—We say that it is inconsistent with Article 3 (D), and a shipowner who has his side-lights fixed as required by the Order in Council does not comply with the terms of that article.

958. Why do you say that the Order in Council is inconsistent with the article?—My association contend that the words "across the bow" used in Article 3 (D) mean, not only across the deck of the ship but across the line of the keel projected ahead of the vessel. Therefore, whilst the article itself provides that lights shall be screened so as to prevent their being seen across that line, the Order in Council requires that they shall be so screened as to show across the line, and the association has been advised by counsel that their reading of Article 3 (D) is the correct one.

959. You refer to the opinion of Sir Walter Phillimore and Mr. Joseph Walton?*—Yes.

960. The whole question turns, does it not, upon the meaning of the words "across the bow"?—Yes, the association take it that those words are in common nautical use, and everyone understands their meaning.

961. Had your association any communication with the Board of Trade before the Order in Council was made?—Yes, in November and December 1892 my association objected to the regulations that the Board of Trade had issued to its surveyors—previous to those dates.

962. Upon what grounds did your association object to these regulations?—We summarised them in a letter addressed to the then President of the Board of Trade on the 9th December 1892. 1st. Because it is in conflict with the international regulations. 2nd. Because screening at less than 4° as now practised by the majority of its members is safer in regard to risk of collision than screening at 4° 3rd. Because, unless the regulation is made internationally binding, shipowners may be held liable in courts of law whether British or foreign for a breach of the existing rules, for it can be shown that they have been, and therefore could be again screened to a less degree than that required by the Board of Trade, and it is apprehended that an order of the Board of Trade upon this subject which is in conflict in certain cases with the international rules will not afford any defence to an action on or a breach of those rules.

963. When making those objections did your association make any suggestions to the Board of Trade?—Yes, we suggested in the same letter that if the instructions issued by the Board were, that no lights should be screened at a greater angle than 4°, then objections would disappear, and we suggested the adoption of such instructions pending any alteration in the international rules.

964. What was the result of your association's objections?—We failed to convince the Board of Trade that our view as to the angle of screening was the right one, but we thought we had convinced the Board of Trade that their instruction was contrary to the existing rule of the road.

965. Why do you say this?—In the correspondence we had with the Board of Trade at that time they wrote, stating "the Board is at present considering "whether it may be possible to make the position of "shipowners as affected by the regulation for pre-"venting collision at sea more secure, either by the "issue of an Order in Council or by other means." And afterwards they did in fact get the Order in Council.

966. Did your association make any reply to this letter?—Yes, we replied on the 2nd January 1893, pointing out, that though no doubt, as regards the United Kingdom, the necessary protection could be given to a British shipowner by an Order in Council or by an Act of Parliament, no protection could be given to the British shipower in foreign courts without international agreement, in a country which had adopted the international rules.

967. Was your association satisfied with the Order in Council?—No, not at all. We thought we were far worse off under the Order in Council, than we were under the regulations. We took it that the Order in Council showed clearly that the new instructions were alterations in the existing international rule of the road, and that such alteration had not been adopted by any other Powers.

968. Have you any special reasons for believing that any of the Powers who were parties to the international regulations look upon the Order in Council as an infringement of those regulations?—The memorandum that is printed on pages 140 and 141 of the Blue Book that was issued in 1894*, containing the opinion of the Netherlands Government, I think, shows clearly that they look upon those alterations as a serious infringement of the international regulations.

969. I think you have a copy of the case for the opinion of Sir Walter Phillimore and Mr. Joseph Walton?†—Yes, the one referred to.

970. (*Sir E. Harland.*) From your early answers, Mr. Hill, are we to gather that the shipowners at Liverpool were not aware of the angle to which the lights of their vessels had been screened for years before that Order in Council was issued?—No, I think they were not fully aware—it varied in different ships and with different surveyors.

971. Perhaps you have seen an appendix which is before us here, which shows the angle to which certain side-lights in the Liverpool District were screened prior to the 4° rule?—No, I have not seen it.

972. In glancing down that list I find that some of the vessels had been screened to $8\frac{1}{2}°$, and a great many to 5°, 6°, and $6\frac{1}{2}°$; two or three perfectly parallel with the keel; and a few to 1°; but glancing down the list, it appears to me, that something like 4° would be about the average?—Are these vessels Liverpool vessels.

973. They are classed as having been examined in the Liverpool district.

974. (*Mr. Ismay.*) I think these vessels are probably not in the association to which Mr. Hill is secretary?—I do not recognise many names that I see in this list.

975. (*Sir E. Harland.*) Then do you think that before the Liverpool shipowners raised their opposition to this Order, they went into the question at all, or examined the angle of the lights, or did they merely take action in the matter from what was reported to them by half-a-dozen men, who appeared to be disposed to move against this Order?—We had a number of meetings when the instructions were first issued—conferences with the marine superintendents

* *See* Appendix 1, No. 3.

* Parliamentary Paper, C. 6869. † *See* Appendix 1. No. 3.

of the lines, and with different captains, and specially appropriated pilots—the question was gone into very carefully at the time before the Order in Council was issued; and ever since then, we have been strongly opposed to the introduction of any crossing of the side lights.

976. Before they took this direct action against the Board of Trade did they total up and strike an average of what their own ships had been screened to?—No, I do not think they did; and I think the information that they have obtained since has, in some instances, been a great surprise to them.

977. Do you think that they have been surprised since the matter has been gone into by the Board of Trade, and the returns published, to discover that there was a great variety of screening in existence?—Very much surprised indeed to know that.

978. And do you fancy that if they had had that information before this action was taken in Liverpool, that they would have been less disposed to take action?—I think their opinion would have been made stronger by it.

979. Though they knew the average had been discovered to be less than 4° ?—No, what I mean is that the view advanced by their nautical advisers was that the crossing of side-lights was most dangerous, and certainly many members of my association had taken steps to guard against it on their own vessels.

980. But from the inquiries they subsequently made as to the screening of their ships do they recommend that there should be no crossing of lights, although they have discovered that their own ships have been sailing all these years with the lights crossing?—As little as possible.

981. Will you define that expression "as little as possible?"—We think that the rays of the light must spread.

982. Is that necessary? Could you not screen a light so that the rays could not possibly spread?—We have been advised by our nautical advisers that the rays must spread somewhat; you cannot get a point of light.

983. Why not? Supposing the chock was made so that the further you went ahead of the ship the further would the rays of light diverge; that is, the further you went away from the ship the less chance there could possibly be of the lights crossing?—They would not wish, certainly, such screening as that.

984. They would not go as far as that?—No, certainly not.

985. Then they prefer that the lights should be given a fair position, perfectly parallel with the keel, and that there should be no crossing whatever, at any distance?—They would prefer that to crossing.

986. Then what is their reason for preferring that class of screening now when their ships have been sailing for so many years with the lights crossing? Would not that be starting an entirely new theory—a new practice, to now ask for a condition of screening totally different to what had ever existed before?—In many of the vessels where inquiries were made it was found that the angle of crossing was from 2° to 3° and no more.

987. Then you go so far as 3°?—No, I do not know that we would if we could get 2°.

988. Then were more of the lights of the vessels belonging to owners objecting screened to more than 3°?—Some certainly were to more.

989. Has there been any complaint made by the pilots or by ships coming into collision about this screening?—There have been a certain number of collisions in the narrow channels into the Mersey.

990. But do you think that is a matter which can be decided by screening, or avoided by screening?—The view my association take is that it is in narrow channels when vessels must necessarily approach on almost exactly opposite courses that the danger comes in.

991. But under those circumstances do you think that the question of screening is so important as in the open sea in view of the pilots keeping to their own sides of the channel, and, therefore, rather judging from their surroundings than from the precise lights of the vessels?—But to judge from precise surroundings is certainly a difficult thing in the narrow channels across the bar; you are getting quite out from the river—there you have very little to guide you.

992. You are speaking of the narrow channels inside the bar of Liverpool?—Yes, right up to the bar and across the bar.

993. And from the bar up?—Yes, from the bar up.

994. (*Mr. Scrutton.*) You are here to advocate 2° screening?—No, we would not like to say that. We are told that there must be some crossing of the lights, and we would like it to be as little as possible.

995. Have you been into the question of the effect of screening at 2°, 3°, and 4°?—No more than being present at all these discussions.

996. The Board of Trade tell us that they attach no importance to the question of the dark lane, but they do attach importance to what is beyond the dark lane, and that is what they term the field; and you will see at once that with a 4° screening you have a very much larger field than with a 2° screening. The narrower the screening the narrower the field; do you follow that?—The field?

997. The space covered by the rays of both side-lights after thay have crossed the middle line?—Yes, I see.

998. Then you recognise that a 4° screening gives you a much wider field than a 2° screening?—Yes.

999. And we are told by the Board of Trade that less than a 4° screening makes it far too narrow a field for the vessels when approaching to see the three lights. Have you looked at that question at all. If you have not, I will not ask you anything more about it?—I do not think that has ever occurred to anyone in the discussions—that it is an advantage to have a large area in which you see the three lights; it has never occurred in the course of our discussions that that was an advisable thing to have.

1000. That is the point that the Board of Trade official made here as a justification for the 4° screening, and he showed us what would be the width of the field. That is a question you have not paid attention to?—No, it is quite a new one.

1001. (*Mr. Bolam.*) I suppose you have not counted up the number of vessels given in the list which Sir Edward Harland spoke about; it is a list of vessels reported to the Board of Trade by the surveyors in the Liverpool and London districts, showing the angles to which their side-lights are screened?—No, I have not really seen the list before.

1002. I have, and if you take the trouble to count them up, you will, perhaps, check my per-centage. I find the Board of Trade list gives 137 vessels, and of these they have reduced the screening of 26 per cent., and increaseed the screening of 40 per cent.; therefore, taking their own figures, they must have increased the screening in a large per-centage?—By increasing the screening I understand you mean that they have made the lights cross more.

1003. Yes, they formerly had the vessels screened 40 per cent. to a smaller angle than 4°, and 26 per cent. to an angle larger than 4°; so that taking their own tables, that would show that in the Liverpool district the new rule has led to an increase rather than a decrease of the angle of screening on the average?—I have not seen the list, but speaking for the vessels in my own association it certainly tended to increase.

1004. (*Captain Castle.*) How do you interpret Article 3 (B) of the Regulations for Preventing Collisions: "On the starboard side, a green light "so constructed as to show an uniform and unbroken "light over an arc of the horizon of 10 points of "the compass, so fixed as to throw the light from "right ahead to 2 points abaft the beam on the star-"board side, and of such a character as to be visible "on a dark night, with a clear atmosphere, at a dis-"tance of at least two miles." What do you consider right ahead; is that right ahead from the light,

*Mr. A. N. Hill.*

1 May 1895.

or right ahead from the stem of the ship?—We have taken it that it must be right ahead from the lights if they are not to cross.

1005. I am not asking anything about crossing; I am asking your interpretation of the article: whether it is right ahead from the lights or from the stem?—I would sooner not venture an opinion. We think that we must read all those articles together, A, B, and C, and D.

1006. (*Captain Thomson.*) I suppose in interpreting this rule, your association had ideas about the meaning of the words used?—Yes.

1007. Can you tell me what their idea was with regard to the expression "Showing a uniform light "from two points abaft the beam to right ahead"?—We have often discussed it: the difficulty appears to us to be that if you start from two points abaft the beam, and make your lights show 10 points, you get the 10 points right ahead of your light. And then the other article says, that your lights are not to cross: but the article you have quoted from says, the light is to show from right ahead. I am afraid we have have not come to a satisfactory conclusion as to what is the proper way of reading all the articles together.

1008. (*Mr Ismay.*) In your association, have you many owners who cover their own hulls and freights?—Some, but not many, cover the entire risks; but a large number of them cover a substantial risk on each of their vessels.

1009. So that, apart from a general reputation for safety, they have a pecuniary interest in the safe going of their vessels?—I think every single member has, and that strongly.

1010. You are a member of the firm of Hill, Dickinson and Hill, as well as secretary to the association, are you not?—Yes, I am a member.

1011. You have considerable practice in the Admiralty Courts, in the nautical part of it?—I think so.

1012. And in the Mersey, what is the experience as regards collisions there?—One of the most common causes of collision in the Mersey is the mistake made of one ship coming to the erroneous conclusion that the other ship is not going to obey the rule of the road.

1013–14. I think you were asked by Sir Edward Harland as to whether vessels did not keep their own sides of the channel. Are there not many sailing ships passing in and out of the Mersey?—Yes, many.

1015. Which necessarily must tack?—Oh, yes; they must tack going out of the river. Many collisions have been caused from that cause also.

1016. (*Sir Edward Harland.*) Just to follow that up, are eight-tenths of the tonnage coming into and leaving the port of Liverpool sailing ships which are under tow in charge of a tug?—If of any size they are. We have a good number of small coasting schooners going out, and they do not have tugs.

1017. (*Mr. Ismay.*) The bulk of collisions in the Mersey do arise from small coasting schooners going up and down the Mersey, do they not?—Yes, certainly.

1018. Your association did not so much object to the angle of screening; they were willing to leave that in the hands of experts, but they thought that the angle was too broad?—Yes.

1019. And they wished a finer angle?—Yes.

1020. But they did not come to a conclusion as to what that angle should be?—No. At the beginning of the discussion we suggested, in our letter which I quoted, that if the Board would say that the angle was not to exceed 4°, we would be quite content to leave the matter for the Board to come to the best possible conclusion if they could get international agreement.

1021. The practice has been in arranging the screening of the lights to leave it to the marine superintendents and the Board of Trade surveyor?—Yes.

1022. And it was only in consequence of the Board of Trade's action that the shipowners' attention was called to the subject?—That is so.

1023. And they since have gone into it rather more fully, and have obtained information which they previously did not possess?—That is so.

1024. And where they have gone into it they have been rather anxious about it, because they think that there ought to be uniformity of screening?—Yes, and also, I may say, as little crossing as possible.

1025. But as regards the international part of it, there ought to be no doubt as regards that?—Certainly; they are very strong indeed upon that point.

1026. In case of collision with a foreign ship?—That is so; and you see we have to go into foreign waters. An Atlantic liner leaving Liverpool in a week is in American waters, and her screens have to be in accordance with the existing American regulations, and she is back again within 14 days, or at the end of a month, at Liverpool, and then her screening has to be in accordance with the English regulations.

1027. Owing to the extent to which the Mercantile Marine Regulations interfere on the other side, the British subject is more liable to be hit than the foreigner?—Far more.

1028. Many vessels trading out of Liverpool have special pilots?—Yes, all the regular lines, I think.

1029. (*Rear-Admiral Andoe.*) I presume that your association considers it most desirable that the side-lights should be seen in their full power right ahead of the ship, at their best?—At their best.

1030. That is to say, as well right ahead as at other points?—Yes, subject to this qualification, that they do not consider it absolutely necessary that they should be seen at the bow of the ship, and in immediate proximity to it—to the stem of the ship.

1031. I am not speaking of the stem, but of right ahead—ahead from the keel?—Yes, certainly.

1032. That is, that the full light should be seen right ahead in that direction?—Certainly.

1033. Did the shipowners make any exhaustive experiments to certain how the screens should be placed so as to ensure the full power being seen right ahead?—No. You mean on shore?

1034. Any where?—When the discussion first arose, and ever since, the members of the association have been getting constant reports from their officers, and there has been constant discussion between the shipowners and the officers upon the subject.

1035. They have not made actual experiments on the shore?—No; no experiments of that kind.

1036. Are you aware that if the screens are not set at an angle, the light would not be seen at the best right ahead of the ship?—That is neither side-light?

1037. They would not be seen at their best. You would see a dim light, but you would not see them at their best right ahead, unless the screen were set at a certain angle; were you aware of that?

1038. (*Chairman.*) Do you mean right ahead of the ship, or right ahead of the lamp?

1039. (*Rear-Admiral Andoe.*) No; right ahead of the ship in a line with the keel, even half a mile, or a mile off, you would not have the full power of the light?—No, that point has been discussed several times. Upon a line projected from the stem of the ship, you would only have, for a certain distance, the reflected rays from the lamp. I do not think the members of the association would object to some distance being lighted in that way, but beyond a certain distance, they would like to get the full light.

1040. Do you think you would get the full light right ahead?—They would like to have it.

1041. Then you would be satisfied with an inferior light right ahead of the ship, anything within a mile?—Oh no, not so much as that.

1042. What distance would you say?—Well, it is difficult, I cannot say.

1043. It is an important point of navigation, you know. It appears from a report which has been put in by Sir Digby Murray* — that

* *See* Appendix 2, No. 5.

several experiments were made and that in several cases right ahead, even with the screens set at an angle, the light was very inferior to what it was at any point on the bow?—That is, from a person standing stationary and taking the light, I understand.

1044. On the line of the keel at a mile or two miles?—Yes, by a person standing on the land taking the light.

1045. Yes?—I quite appreciate it.

1046. So that the light is inferior right ahead even with the screen at an angle?—Yes, but we take it that another vessel approaching at any distance—such a distance as you have named, a mile, for instance—would, from the movement of the vessel herself, or from the inaccuracies of steering, or anything else, be getting the light full.

1047. Was the objection to the 4° screening made principally by the captains of ships, or by the pilots?—I think everybody concerned. I do not know that it was one more than the other.

1048. Are you not sure that the pilots took action first about it?—Oh, the pilots complained very much about it.

1049. Do not vessels approaching Liverpool under steam, or in tow, always keep on one side of the river according to the local regulations?—They are supposed to.

1050. They ought to?—They ought to.

1051. Therefore the side-light would not affect them materially if they followed their regulations?—But they do not always.

1052. We have here a report* from Sir Digby Murray, which says that 40 per cent. of the vessels sailing from Liverpool had their side-lights screened to less than 4°; can you say whether that fine screening was adopted by any particular class of ships; whether more by the larger craft, or more by the smaller craft?—I think it must have been done by the large craft, because it is the large ships that are in my association, and certainly to the members of my association the instructions that were issued in 1892 meant a broader screening. They were all affected, having to put the screens to make the light cross more.

1053. Were the screens of vessels in your association carefully examined before any alteration was made in order to comply with the regulations?—Yes, I think a great many; a great many of them have passenger certificates.

1054. Have you got, or could you give us, a return of how they were affected by the regulations?—I think I could get it. I have not got one. I have not got any record from which I could get it.

1055. In proposing to screen the side-lights to 4°, are you aware that the International Conference at Washington recommended that the lights should be screened to not more than half a point?—It is not incorporated in the Washington Rules as they are put forward.

1056. But that was the spirit of the regulation, was it not?—But the rule stands that they shall be so screened as to prevent their being seen across the bow. I would point out with reference to that, when the Blue Book* was issued showing in one column the regulations in force, and in the other column the revised regulations, my association came to the conclusion that it was the intention to repeal the Order in Council of January 1893, because if you will refer there, you will see the Order in Council is set out as paragraph E. to the regulations now in force, and there is a blank space left in the corresponding paragraph of the revised regulations; and in the revised regulations they repeat the prohibition that the lights are not to be seen across the bow.

1057. This expression "across the bow" appears to be understood differently by lawyers and seamen. I believe I am right in saying that the lawyers have sometimes taken it that "across the bow" means close to the stem, whereas seamen generally understand "across the bows" as a distance from the ship?—Well, we always understand it just as much as we understand that a crossing ship is a ship that is going across the line projected ahead, and not over the deck of the ship.

1058. Are you aware that it would be almost impossible to prevent the rays crossing?—Yes.

1059. In the report from the German Lloyd† on the fixing and screening of the side-lights before the Committee, I see it is stated that on most ships which are not English, the screens are set to 6° or 8°?—Yes, I have seen the report.

1060. Have you any reason to doubt that as being correct?—In the case of ships belonging to the Netherlands I should doubt whether it is correct.

1061. (*Chairman.*) Has your association formed any opinion as to the part of the lamp or light from which the screening should be measured, whether it is the outer edge of the wick, or the centre, or the inner edge or the centre of the lens?—There have been many discussions, but I am afraid there has been no conclusion. It is difficult to express an opinion, but I think the majority are in favour of the inboard edge of the wick.

* *See* Appendix 2, No. 2.

* *See* C. 6869, page 148. † *See* Appendix 2, No. 10.

Mr. PETER SAMSON recalled and further examined.

1062. (*Mr. Scrutton.*) I think you have stated that with 2° screening and with a ship 60 feet broad, half the breadth of the field at a quarter of a mile is only 23 feet?—That is right.

1063. Can you tell me what half the breadth will be at 1,500 feet at 4°?—75 feet.

1064. Then we are agreed that there is all that difference between 23 feet and 75 feet?—Quite so.

1065. How does it occur that in screening at 4°, and in screening at 2°, one is not exactly double or half of the other?—It is double from the crossing point, but not from the lights.

1066. (*Sir F. Evans.*) On each side of the light it would be the same?—Yes; taking it from the crossing point, but not from the light.

1067. (*Mr. Scrutton.*) You have used an expression, "the mingled rays"; that is the first instance I think that we have had that expression in the evidence?—Yes.

1068. Does that mean that we do not see the two lights distinctly—separately?—No; you see each light distinctly.

1069. It would be quite right to speak of seeing the two lights?—Certainly; I put it in that form so as to make a distinction between the lights within and without the field.

1070. (*Sir F. Evans.*) The exact course of a ship that is approaching another cannot be ascertained as long as you can see the three lights, can it?—I should say that one vessel was practically ahead of the other if each vessel could see the other three lights.

1071. You would call it ahead although they may vary as much as a point out either side of the bow?—Half a point or rather 4°.

1072. Say half a point. What is the object of keeping the vessel that is approaching so long without the knowledge of the course of the other. I cannot understand why you want to keep a vessel approaching another in sight of all the other three lights until he is almost on top of her. I was taking the instance of myself approaching another vessel and I see his three lights, and I do not know which way he is going why do you want me to stand on until I am almost on top of him before I can tell which way he is going?—I do not want anything of the kind. The moment you see the three lights you know that a vessel is approaching you almost end on, and it is your duty to get out of that position as soon as you can.

*Mr. A. N. Hill.*
1 May 1895.

1073. Then you agree with me, the wider you make the field, the greater the space during which I cannot tell how the vessel is. Why do you not narrow that field in order that with a slight variation I can find out exactly where she is?—There are several reasons. One is that you cannot get the light uniform throughout the range required by the Regulations. Then another important reason, is that the field in which both lights are seen becomes so narrow at say a mile from the vessel, that two vessels meeting on parallel courses might see each other's green light without the red light and still come into collision if they kept on. It is, I think, of great importance that the field should be broad enough to admit of the "green to green and red to red" rule being adopted with safety, and that width of field cannot be got with lights screened to less than 4°. I may point out that there is no definite Regulation to guide those on board vessels in the position I have assumed, and if the "green to green and red to red" rule were not dependable, both vessels in their desire to give each other a wide berth might unknowingly take a course which would lead them into collision.

1074. Would you call that seamanship for a man to run it so fine that he had the green light there?—In thick weather those vessels might get there without seeing each other's side-lights, and in that case seamanship would not enter into the question.

1075. I will take a case—I very often go across the Atlantic—which I have been in myself, where we have been in the most dangerous position, perhaps, of all, namely, of shifting fogs, where you run in and out all the time. What a pity it is to limit the time during which you may determine the course of a vessel approaching. He runs suddenly out of a fog—he sees no lights that would make him certain of his position until he is almost jumping on a man's head?—But half the breadth of the field in which both lights are seen is, at the extreme distance of two miles (12,000 feet) from the vessel only 800 and some odd feet—about 820 altogether, so that a ship anywhere within that half field knows that she is practically right ahead of the other ship. That, I think, is most valuable information, and it is information which she would not possess if the lights did not cross, for in that case each vessel would only see one side light of the other vessel and consequently be uncertain within 10 points as to the direction in which she was steering. A slight movement of the helm would move the field of mingled rays off the other vessel and then she would know by seeing only one side-light, that her own lights had been seen by your vessel, and the direction (port or starboard) in which your vessel had altered its course. I think there is a great deal of misconception regarding the time required to turn a vessel through 4° of a circle; it is only a matter of seconds and the time occupied in turning through the last two degrees must be almost infinitesimal.

1076. (*Captain Thomson.*) Is it not a fact, that the only case in which the screening touches, so to speak, the rule of the road is that where two vessels are approaching nearly end on, or where one ship is overtaking the other?—I think so.

1077. Do you not think the question of screening is perhaps more important at short rather than at long distances, for this reason: that at a long distance there is not the present immediate risk of collision, and the rule of the road does not take into account that you could tell by the alteration of the bearing of the light the direction in which the ship is steering to a certain extent. But that occurs at a long distance, two miles, or one, or even half-a-mile with slow ships. You can watch your ship and alter your course accordingly; in fact, it is a common thing for ships to port when meeting long before there is risk of collision?—Well, not always; I think they frequently keep on until fairly close, that is, until they are within a mile or so of each other.

1078. Perhaps I should not have said "always"; I should have said "generally." Do you not think the question of screening is of more importance at short distances, when you have to act at once upon the rule of the road, than it is at long distances?—I certainly think so. Of course, the difficulty is in knowing the distance you are from the ship, as much depends upon the condition of the weather. In fine weather, you can estimate the distance very closely; but if the weather is at all thick, it is then a very difficult matter.

1079. (*Captain Castle.*) Because you see the masthead first?—Yes, but the weather also materially affects the distance at which you can see that light.

---

## Thursday, 2nd May 1895.

PRESENT:

THE RIGHT HON. SIR FRANCIS H. JEUNE IN THE CHAIR.

Rear-Admiral ANDOE.
Mr. BOLAM.
Captain CASTLE.
Sir EDWARD HARLAND.
Captain HALLETT.
Mr. ISMAY.
Mr. SCRUTTON.
Captain THOMSON.

Mr. C. HIPWOOD, *Secretary.*

*Mr. J. G. S. Anderson.*
2 May 1895.

Mr. JAMES GEORGE SKELTON ANDERSON*, called and examined.

1080. (*Chairman.*) I think you are a member of the firm of Anderson, Anderson, and Co., are you not?—I am, and one of the managers of the Orient Company.

1081. I think you have come here at the request of the General Shipowners' Society?—I have.

1082. Do I understand that you have not made any actual experiments for the purpose of giving this evidence?—No, I have made no experiments, and I do not offer myself as a technical witness.

1083. When did this question of side lights first come prominently before your notice?—About the middle of 1892.

1084. How did it arise?—It was reported to me by some of the captains and the overlookers of the ships that the Board of Trade surveyors were increasing the convergence of the lights, and they looked upon that step with some misgiving.

1085. I think you went to Whitehall?—I did.

1086. And saw Sir Digby Murray?—I did. I was accompanied by our senior captain, Captain Ruthven,

* The Committee were subsequently informed that the Sunderland Shipowners' Society entirely agreed with the statement prepared by Mr. Anderson, and consequently did not deem it necessary to send up any of the members of their Nautical Committee to give evidence.

of the mail steamer "Ophir," and by Mr. Posgate, our senior pilot.

1087–8. Would you tell the Committee what took place?—Sir Digby Murray told us that he had studied the subject for years, and had made exhaustive experiments at Shoeburyness. He explained that side lights had never been screened without some degree of convergence, and that if they were screened with no convergence there would be a dark lane ahead of the ship. He further stated that of late years, at any rate, ship's side lights had been screened to varying degrees of convergence and divergence, and that the sole object of the new regulations was to insure uniformity. He said that instead of 4° of convergence being dangerous, as we feared would be the case, it would, on the contrary, make for greater safety, because the large majority of ships which his surveyors had, up to that time, examined had their lights screened to a greater angle than 4°. Sir Digby Murray illustrated with two pieces of paper his dark-lane theory, and the danger which the dark lane caused to two ships of different beam approaching each other end on, and dwelt upon the recommendation of the Washington Conference that side lights should be screened to 5° of convergence each. The recommendation of the Conference, he said, was founded upon a French translation of what purported to be a Board of Trade rule; but he thought there was some mistake as he did not believe it had been the practice of the Board of Trade to screen to so great an angle as 5°. Nevertheless there was the recommendation of the Conference, and he had to meet it. He had not, however, gone the full length recommended. He had only gone to 4°, and that had been in the past the practice of the best lines. For instance, he said, one of the steamers belonging to the Orient Company (with which I am connected) the "Lusitania" on her then recent arrival in Liverpool, had been inspected by the Board of Trade surveyor, and was found to have a convergence of 4° each side light, and the surveyor consequently made no change. I went away unconvinced, and a good deal puzzled. I was not able to give Sir Digby Murray an effective answer at the time; but I ascertained afterwards that in the case of all steamers and vessels with which I had any connexion the chocks had to be reduced in depth under the new regulations, thereby giving greater convergence, and in no cases had the depth of chock to be increased, and in the case of the "Lusitania" the chocks had been cut down in London before she proceeded to Liverpool.

1089. What conclusion did you form from that?—I came to the conclusion that Sir Digby Murray was wrong in thinking that there had been no change under the new rule with regard to the practice of careful owners, and I concluded that the application of the 4° rule had, in point of fact, led to a change in the direction of greater convergence than was the practice before.

1090. You gave expression to those views, I think, did you not?—Yes, in February 1893, I read a paper about the screening of the ship's side lights before the Chamber of Shipping of the United Kingdom, not dealing with the subject in a close technical way, but in broad terms (I hand in a copy of the paper*), with the result that a deputation from the Chamber waited on the President of the Board of Trade on the subject, and represented the danger arising, as it appeared to them, from the enforcement of the new order.

1091. I think that the deputation handed in a protest from the pilots at the same time, did it not?—It did, and I hand in a copy of that protest also.†

1092. Your view is, is it not, that the Board of Trade action was taken in consequence of the Washington declaration?—Yes, on this occasion, as when I previously waited upon Sir Digby Murray, the Board of Trade referred to the decision of the Washington Conference as imposing on them a certain necessity to move in the direction of the new order, and the report of Sir Digby Murray and Mr. Samson on the subject of their experiments* shows that these experiments were undertaken in connexion with the Report of the Washington Conference.

1093–4. What was the result of the deputation?—Sir Digby Murray presented statistics, and in the face of these the deputation fully recognised that it was necessary that something should be done to bring about the uniformity in practice which they hitherto had imagined the Board of Trade regulations and surveyors had secured for them. Those who had given most attention to the subject were of opinion that no harm but, perhaps, the reverse would result from allowing some small convergence of the light; in fact, that if the full brilliancy of the light were to be shown ahead of the lamp as well as for the remainder of the 10 points over which the Act requires a uniform light, it would be unavoidable that some of the rays should cross at a certain distance ahead of the ship. The question to be determined was the degree of convergence. The deputation remained firmly of opinion that 4° of convergence was too much and made for danger, especially in narrow waters.

1095. After the deputation, it was discovered, I think, that the Washington recommendations seemed to be based on misconception?—Yes, up to the time of the deputation it had never been pointed out, so far as I know, by anyone that the Washington Conference had unwittingly recommended an angle of convergence double of that which they had intended to recommend. Public attention was first drawn to this fact in a paper in the "Nautical Magazine," by Captain Ruthven.

1096. What was the blunder?—Well, the blunder appears pretty clearly from the protocol of the proceedings. They are dealing first with the angle formed by the crossing of the rays from the two side lights, and they go on to apply that angle to each side light, forgetting that the subtending angle of the triangle in this case is double the angles at the base. What the Washington Conference did, in point of fact, recommend, was that each side light should be screened to a convergence of half a point; but obviously what they intended to recommend was that the sum of the convergences of the two lights should be half a point—*i.e.*, that each side light should have a convergence of a quarter of a point, that is, just over $2\frac{3}{4}°$.

1097. Did you bring this point to the notice of the Board of Trade?—The Board of Trade, notwithstanding these representations of which I have spoken, persevered with the application of their new order, and in consequence of this the then President of the Chamber of Shipping of the United Kingdom, in the months of February and March 1893, corresponded at some length with the then President of the Board of Trade, urging on his notice the blunder on which the new order was based. I have the permission of the Chamber of Shipping to hand in, as I do now, a copy of the correspondence† referred to. The result was that another Conference was held at the instance of the Board of Trade in which Mr. Corry, who is to give evidence after me in this matter, and I myself were associated with others on behalf of the shipowners.

1098. What took place at this Conference?—Sir Digby Murray again told us that he felt compelled to go as high as 4°, because of the Washington Conference and of his own experiments, and because it was about the average of the practice in the past; but he then admitted what we had all along contended for, that 4° might be too much convergence in narrow waters, and said he would not be opposed to having two different screenings, one for narrow waters and one for the open sea, but that suggestion did not seem to any of the deputation a practical one.

1099. Was the question of lamps referred to?—Yes, we again urged upon the Board the dangers that were feared from this degree of convergence in screening,

* See Appendix 2, No. 5. † See Appendix 6, No. 3.

*Mr. J. G. S. Anderson.*

May 1895.

and fully recognised the need for uniformity and that something should be done to secure uniformity; we pressed upon the Board of Trade the need there was that the lamps themselves should be of correct and uniform construction in every detail, without which uniformity of screening was unavailing. We told the Board that the lamps at present in use were extremely irregular, many of them being thoroughly bad in every way. Mr. Corry will speak as to the construction of lamps, so I will not anticipate him. The Board said it was impossible for them to undertake the surveillance of the lamps themselves, they had not sufficient staff for the purpose. I suggested that they should invite Lloyd's Registry to undertake it as in the matter of testing chain cables and fixing load-lines.

1100. Do you desire to offer any opinion as to the exact angle to which the screening should be reduced?—No, I do not feel exactly qualified to do so, but later on I will express approval, as complying with the existing Act of Parliament, of a certain order which appears in the Instructions to the Board of Trade surveyors in 1875.

1101. I understand that you think that 4° is too much?—I do think so.

1102. Now, will you give me, if you please, the reasons on which you base that opinion. First of all, as to the Act of Parliament?—Well, as to the Act of Parliament dealing with the matter of side lights, I consider that the two chief conditions, the limitation to a certain arc, and the requirement of full power over that arc, as required by that Act, are incompatible with each other and cannot be fulfilled together. From the study I have given to the Act, and from such practical knowledge as I possess, I am of opinion that those who drew the Act did not intend that there should be any convergence, and were not aware that it is impossible to get the same strength of light ahead as abeam unless some convergence is allowed. I am in favour of the nearest approach to parallel screening consistent with showing the full power of the light ahead of the lamp; that is, within the arc of 10 points, as required by the Act.

1103. I think you have considered the Instructions of the Board of Trade to surveyors, have you not?—Yes, I think that the Board of Trade Instructions to Surveyors of 1875, page 98, show what the best practice was at that date. I think that that practice would comply with the Act, and it is to that practice that I referred a few minutes ago when I said that I could express approval—given the existing Act. I quote the following from the Board of Trade Instructions of 1875: "Surveyors will probably find that if the "inboard edge of the wick touch a line that is parallel "with the keel of the ship, and that cuts the outer "edge of the forward end in the inboard screen, the "rays will cross suitably."

1104. Are you aware that this is inconsistent with other Board of Trade Instructions, issued prior to 1892?—Yes, I consider that is a very clear and practical instruction—that which I have just read, assuming that the width of the wick is provided for. It follows after some instructions which appear to be somewhat inconsistent with it and which make it appear as if it were desired that the lights should be screened to the inner edge of the lens and not of the wick. But I understand that in a properly-constructed side light, with the wick in its proper position, the two instructions would amount to practically the same thing, as may be seen by a reference to the diagram in the Board of Trade Instructions to Surveyors of 1892 and of 1894. A line parallel to the keel drawn to the inner edge of the wick is the same thing as a line to the inner edge of the lens; but unfortunately the lanterns are in many cases wrongly constructed, and in such cases the wick is the only safe object to screen to if any object in such case is safe to screen to.

1105. What is the result at which you arrived on this point?—Well, from what I have said, it appears that the Board of Trade experiments and inquiries into this subject, which led to the new order, were undertaken in consequence of the Washington Conference, and that but for the Conference recommending the excessive convergence which it did, the new order would not have gone so far as to require a degree of convergence now admitted by the Board to be a possible source of danger in narrow waters.

1106. You think that the effect of the Board of Trade being influenced by the Washington Conference led them not to take such counsel with their outdoor surveyors as they would otherwise have done?—Yes, I have that feeling very strongly. I think they were supported and led on by the Washington Conference, and they neglected to take that counsel with their outdoor surveyor's staff which might have saved them from the extremes into which they have fallen in this matter; and in this connexion I would refer to a departmental notice of November 1892, numbered 5, in which the following appears: "Numerous criticisms have been made by people "ignorant of the subject on the Board's recent "instructions as to the screening of side-lights, in "one case, I regret to say by one of our own officers, "who ought to have been better informed." I think that the effect of such an order must have been to stifle counsel, and to discourage the production of statistics not in accord with the action to which the Board of Trade had committed itself.

1107. (*Mr. Ismay.*) Have you got a copy of it?—I have not got a copy of it, but no doubt the Board of Trade can supply one.

1108. (*Chairman.*) Now, as to the electric light. Have you anything to say with regard to that?—Yes, I think with regard to electric side lights special experiments are needed. I think probably a less degree of convergence might be advisable with such lights of larger carrying power. It has been spoken of to me, and I have noticed it myself, that mail and passenger steamers whose passenger spaces are lighted by electricity appear at sea as large luminous objects. Oil lamps for masthead and side lights of such vessels are unsuitable. The light is too feeble, and becomes drowned by the luminosity of the electric light. The masthead and side lights of such vessels ought always to be lit by electricity.

1109–10. Do you regard as satisfactory what you took to be the intention of the Washington Conference, namely, a screening of something like $2\frac{3}{4}°$; that is to say, a quarter of a point?—If I may answer that question in my own way, the mode of screening laid down in the Instructions to Surveyors in 1875, which I have read with a certain approval, gives for paraffin or kerosine lamps having wicks 1 inch wide a convergence of $1\frac{1}{4}°$, and for colza oil lamps having wicks $1\frac{3}{4}$ inches wide a convergence of about 2°.

1111. I am not quite sure that I understand how it is that, in your view, screening to the inner side of the lens is the same thing as screening to the inner edge of the wick. I should have thought there would have been a considerable difference?—I think Mr. Corry, who has drawings, will make it clear. Meantime, I think I can explain my meaning by reference to the small diagrams in the Board of Trade Instructions to Surveyors.

(*Chairman.*) I quite understand. In the Instructions the two things look very much the same.

1112. (*The witness.*) Shall I hand this in?

(*Chairman.*) I think we have copies.

1113. (*Rear-Admiral Andoe.*) If the Regulations, as they were worded in 1875, which provided that the line drawn from the inner edge of the wick to the outer edge of the chock, and parallel to the keel, were complied with, do you consider they would be proper ones for the fixture of screens?—Well, I have disclaimed any pretence to have the technical knowledge to arrive at a final decision. But, as far as I know, that seems to me a very sensible and defensible screening under the Act, because it gives the full light ahead and abeam, and you cannot have that without screening in that way, as far as I know.

1114–5. I think you said that it is the same thing whether you measure from the inner edge of the lens,

or the inner edge of the wick?—Yes, with a properly constructed lamp.

1116. These lamps, as they are, vary in size, and consequently the wick may be at a greater distance from the screen in one lamp than another?—Yes.

1117. And, consequently, the angle at which the rays cross the bow varies according to the lamp?—Yes. I did add, in expressing such approval as I did express of this instruction of 1875, that I assumed the width of the wick was settled.

1118. The width of the wick was mentioned?—Yes, that must be settled otherwise, or, as you say, the convergence will vary.

1119. (*Mr. Ismay.*) What tonnage are the vessels of your association?—Of my company?

1120. No, the association that you represent. I thought you represented an association?—Yes, I do. I cannot tell you, it is very large.

1221. (*Mr. Scrutton.*) Millions?—Oh, yes.

1122. (*Mr. Ismay.*) I suppose they are chiefly ships of a larger class?—All sorts.

1123. Do you think that, as a matter of fact, the larger ships are screened to a finer angle than is the case in smaller ships?—That I cannot tell you. I should think in the case of larger ships more attention has been paid to the matter, and I should expect to find that there had been more uniformity, and probably they had been screened finer. If I may amplify a little, I should expect to find that the irregularities in screening have grown up of late with the new class of shipowners that have come in since the opening of the Suez Canal, and that probably before that time, when there was not so much shipping, and when shipowning was more of a profession the thing was better done. I gather that from what old pilots tell me.

1124. Possibly that would be because the shipowners had previously been shipmasters?—Very likely, and had looked after ships from father to son.

1125. Does your association lay great stress upon the fact that there should be an international agreement?—It does.

1126. Why, may I ask?—Because they fear that the owner of a British ship screened not in accordance with international agreement would lose his case if he went into a foreign court in the event of a collision.

1127. You have not heard of a case of the kind?—I do not recall any.

1128. What do you consider the chief causes of collision?—Uncertainty on the part of those in charge of the ship; that is to say, uncertainty as to the signals, and uncertainty as to how the other ship is going.

1129. May I take it that although there are regulations in the rivers for each ship to keep her own side, it is desirable that the lights should show quickly what she is doing?—It is.

1130. And I suppose you have been on frequent trips down Channel yourself?—Yes, I have been a good deal in the Channel.

1131. I think I have passed you in the Bay of Biscay in March?—Yes, in March. We exchanged night signals.

1132. You have more than an ordinary practical acquaintance?—I think so. I have been about the world a good deal by sea.

1133. You have written a very able paper upon this subject?—I am handing it in.

1134. (*Captain Thomson.*) I think you are in favour of screening from the inside of the wick parallel to the keel, are you not?—I have expressed approbation of that up to a certain point, without expressing the opinion that finer screening cannot be arrived at. I do not see how that can be arrived at while the Act continues as it is.

1135. In that case have you any idea what convergence that will give you, that is to say, what angle your most convergent ray will make with the line of the keel?—Yes, $1\frac{1}{4}°$ to 2°, according to the width of the wick.

1136. It is not uniform screening; it would not be uniform in that case, it would depend upon the wick?—To ensure uniformity the wick must be of a prescribed uniform width.

1137. Then in the case of the electric light, which, of course, is a more concentrated light, you would have finer screening than you would with a colza wick?—I rather think so with the electric light. I am not quite clear about that. I should like experiments tried. With the electric light you would have the light more in a point and less in a band.

1138. It is so undoubtedly, the incandescent lamp has a much smaller diameter?—Yes.

1139. You said the convergence was the principal point. You said also the 4° was too great an angle of convergence?—Yes.

1140. But 4° is from the outside of the wick?—Yes.

1141. And therefore that is supposed to be an outer limit of the converging rays?—Yes.

1142. Whereas, of course, the difference then is between 4° and 2° in the case of a colza oil wick? Is not that it?—Yes $1\frac{1}{4}°$ to 2°. With 1-inch you would have $1\frac{1}{4}°$ of convergence. I should like to see the 1-inch wick as the standard, so as to reduce the convergence.

1143. Can you tell me the candle-power of the electric lights in your ships?—I am afraid I cannot.*

1144. Have you considered this question with reference to the present rule of the road?—Yes.

1145. In the case of two ships meeting nearly end on at night time, supposing the outer rays were limited to 2° convergence, the ships steering opposite parallel courses would never come under the rule to port their helm at any time, unless they were within that angle of each other, which is a very small one, 2°?—Never.

1146. They would never come under the port helm rule; that would be a source of danger, would it not? It is rather a technical question I am afraid, but I think you have considered the subject?—No, I was taking time because I did not quite understand your point. Ships meeting end on?

1147. Nearly end on?—End on, or nearly end on. It all depends how near they are to being end on. If they are dead on they should pass red to red.

1148. Yes, that is not quite my point?—If I see a ship approaching me and she is on my starboard bow, and I see a bright masthead light, and her green light, I hold on my course, and pass green to green. I do not necessarily run into danger and cross her bows to get red to red, because we are perfectly safe. But if there is a great convergence, that vessel being still in the same position, a position of safety, she may see my red light, and then she unnecessarily runs into danger by crossing my bow to comply with the rule of the road, and if she does not comply with the rule of the road, she would be non-suited in the Court in case of an accident. She would be asked, why did you not comply with the rule immediately on seeing the signal while there was yet time. It would be no use of a master saying "I waited to see whether it was a mere squint of light." There is the rule, and he has got to comply with it, whatever happens.

1149. I think you are quite right, when you see both a ship's lights nearly ahead you are bound to port your helm, even if you see only a squint?—Yes.

1150. That this is for both lights?—Yes.

1151. Now, I want to draw your attention to the finer screening—the 2°. Then ships would never have to port their helm according to the rule of the road unless they made very fine angles with each other; 2° is a very small angle. It would practically limit porting to ships being right ahead of each other?—Yes.

1152. Mathematically ahead almost?—Yes.

1153. You understand that?—Yes. I imagine so, because if they do not see the red light they would not port. If they saw the green light and did not see the red light they would not port.

* Mr. Anderson subsequently informed the Committee that they were all of 32-candle power.

*Mr. J. G. S. Anderson.*

2 May 1895.

1154. Then, whenever they were more that 2° from each other they would not port?—No.

1155. And yet against that we have been told the words "nearly ahead" have been held to include as much as a point. You see the source of danger in that?—I see a source of safety in it, not danger. I think, with fine screening, they know accurately each other's position. It is uniform screening, and they know exactly what the screening is. It is the same in every ship, and they use their discretion, edging off a little bit so as not to pass each other too closely, but not crossing each other's bows. I think the side lights were originally bow lights. They were very near each other, and carried on the forecastle in the fore part of the ship. Suppose they were back to back with a long screen between, would not that give perfect screening. You would see each light dead ahead and neither across. There is no dark lane in my judgment. You would not see a dark lane. The natural yaw of the ship forbids that and the refraction of the light. The side lights would then signal accurately and definitely what the ship was doing and what her course was, and that is their object.

1156. (*Captain Hallett.*) What makes you consider that there was a blunder at the Washington Conference, that they recommended half a point when they meant a quarter of a point?—The protocol of the proceedings shows it. You can trace the whole progress of the mistake. They were discussing this question of screening. Captain Mensing, of the German Navy, produced a French translation of what purported to be a rule of the Board of Trade on the subject; and in this rule it spoke of the angle formed by the rays crossing each other in front of the ship; that is to say, the subtending angle of the triangle. They were discussing that, and then they broke up for luncheon. When they came back they applied this angle to each side light, and the resolution to this effect was carried by a large majority. You can see the whole growth of the mistake till, finally, they recommended double what they intended to recommend.

1157. Before the Board of Trade issued these instructions, laying down the angle of screening absolutely to be 4° from the outside of the wick, do you happen to know what your own vessels were screened to?—No, but I know all our vessels were screened to a considerably finer angle than 4°, because in every case the chocks were cut down by order of the Board of Trade surveyors to comply with the new order.

1158. You are talking of the Orient line?—No, I am talking of the Orient Company. There are ships belonging to the Pacific Company also running in that line, but I cannot speak for them.

1159. (*Sir E. Harland.*) Chocks cut down here?—Yes, cut down.

1160. (*Captain Thomson.*) For the association that you represent, can you speak to that at all?—I cannot speak to that.

1161. (*Captain Castle.*) I suppose all the ships of your own company would be screened at the same angle, would they not?—That I cannot say, but I should expect to find it so because the overlooker would know——

1162. Only one superintendent?—One superintendent, but the screens were altered before I knew about it.

1163. You were speaking of, say, a green light nearly ahead, a little on the starboard bow, not necessarily to port. You say you have been to sea a great deal yourself, do you not think it would be better to starboard a bit to give a wide berth?—I think it would be better to edge off a little.

1164. That is, to starboard, and give it a wide berth?—Yes, and not cross the ship's bow.

1165. (*Mr. Bolam.*) Have you seen the list of ships in the paper* put in by Sir Digby Murray, belonging to the London district. He gave the angle of screening, previous to the new instructions, as on the average over 4°?—Yes.

1166. Have you counted how many of these vessels had the screening reduced, and how many had it increased?—No, I have not, but I got the figures from Sir Digby Murray. I have not counted them myself; Sir Digby Murray gave them to me, but I have not got them here.

1167. Is it your impression then that in the London district the number of ships having the angle increased is greater than the number of ships having the angle diminished?—From my recollection of Sir Digby Murray's figures, it was so.

1168. More ships had had the angle diminished?—I am not sure, I could not answer as to that.

1169. I should like to know whether the figures agree at all with this abstract I have made myself. I find, taking the London district, 34 of the vessels have had the angle reduced, and 54 have had the angle increased?—To greater convergence.

1170. Yes, and 12 per cent. practically untouched?—Yes.

1171. If these figures are accurate, it would show, as far as this list is concerned, the 4° angle in the larger number of vessels has been increased in the London district?—That a majority of vessels had been screened finer.

1172. Yes, had been screened finer before?—Yes, I take that from you. And then there is no doubt from the statistics—I do not altogether accept these statistics—I daresay they are perfectly honestly got and put forward, but I do not think we can rely on them absolutely. The case of the "Lusitania" has shown us one possibility of error creeping in, viz., that the same ship may be dealt with twice; and also, I think, that at first the surveyors did not know how to take the angles. I know of one case where we could see the lights upon the forecastle of the ship crossing inside the stem, and they could never have intended to do that, because it is contrary to their order. There is that element of doubt about the statistics, that I think these surveyors did not know exactly how to screen; they had certainly neglected it in the past, as if they did not understand it in the past.

1173. Between vessels meeting end on and passing each other and between vessels meeting end on and crossing each other, there will always be a limit, will there not, of necessity. There will always be a betwixt and between of meeting and crossing, will there not?—Yes.

1174. It is impossible to get over that?—Yes.

1175. There must be a limiting case between meeting and passing, and a limiting case between the meeting and crossing back?—Yes.

1176. In your opinion, will that difficulty ever be got over by any law of angling. A limiting case would exist whether you screen to 1°, 2°, 3°, or 4 points, for that matter?—The question about crossing? What I understand you are referring to is whether the vessels crossing ahead or astern——

1177. When the two vessels are a little end on, and crossing a little, there will always be the difficulty in deciding whether those vessels are meeting or crossing; there will always be a limiting case in which the officer will be in doubt?—You mean under the new order?

1178. No, I mean absolutely?—If he is in doubt he will be obliged to obey the rule.

1179. Therefore you will never do without the exercise of judgment and intelligence on the part of the officer whatever the rule of the road is?—Yes, but the less you have of doubt the better.

1180. Quite so. Then if you have a large area of screening you will increase it very much?—Yes, you will increase the region of doubt.

1181. During the period from the ship showing both her side lights until she sees one there will be the period of doubt?—Yes.

1182. And at any rate it would be desirable that that should be as short as possible?—Yes.

1183. (*Mr. Scrutton.*) You have given a good deal of attention to this matter?—Yes.

* See Appendix 2, No. 7.

1184. And I have no doubt you have received from other shipowners and others information upon the subject?—I have.

1185-6. That being so, could you give us any cases in which you feel there has been danger in consequence of the regulations?—Yes. I could give you an actual case.

1187. Will you kindly do so?—A steamer belonging to one of the Australian mail and passenger lines was bound down the river, in some of the channels at the mouth of the river, and there was a vessel meeting her on her starboard bow. They saw her masthead light and her green light, and the pilot in charge of the Australian steamer held on his course intending to pass starboard to starboard, keeping this ship on his starboard side, and as he approached the ship there was another ship appeared in the distance, meeting him dead end on. Well, it was necessary for him to comply with the rule of the road towards that other steamer that was end on, and to port his helm. He knew that the side lights had been changed under the new order, and was alive to the risk of showing his red light to the vessel which he was going to pass green to green. He said to the quartermaster, "Now, be careful, I think four or at most five degrees will do all that is wanted." The quartermaster did it very carefully, but the vessel on his starboard bow got a glimpse of his port light, and immediately ported her helm, and swung right across his bows, to the danger of collision. The pilot that was in charge of the Australian steamer attributed it entirely to this change in the screening. I consider that a very good illustration of the danger of large convergence in narrow waters.

1188. (*Captain Castle.*) What part of the river is that?—Well, you will have Mr. Posgate here, and he will tell you that. His brother was the pilot in charge. I really did not intend to take this story out of his mouth, and he will tell you exactly where it happened.

1189. (*Captain Thomson.*) They were both the wrong side of the river, were they not?—I do not know exactly. Mr. Posgate knows all the circumstances, and I will tell him to get that information. I will give you another instance, if you will allow me. It occurred on the 29th March with the British steamer "Brinkburn," bound out from Toulon to Madagascar with war supplies for the French, and she had just entered the Straits of Messina from the north, at least she was near that end. She was at the part where the ancient whirlpool of Charybdis is, which causes ships to yaw about a great deal, and she had seen a steamer for some time approaching her, coming from the south on her starboard bow. The "Brinkburn" was holding on her own course, to pass this approaching steamer green to green, the "Alva" was her name; she was under the Sicilian coast, and the "Brinkburn" was towards the Calabrian coast, and this eddy of Charybdis caused the "Brinkburn" to yaw to the starboard. She did not yaw so far as to be end on to the other vessel, but so far as to be nearly end on. It did not occur to her that she had shown her red light, and she went back to her starboard helm again, flew back to it suddenly, as suddenly as she had gone, but she had shown a glint of her red light, enough to bring the "Alva" upon her, and the "Alva" herself sunk. I consider that was a loss probably caused by this considerable convergence. I think there is no doubt about the facts of this case. It was investigated at Malta, and I have read the whole account and the report of the evidence. The story is confirmed by the French officers who were on board, who had their binoculars and saw it all.

1190. (*Chairman.*) What report was that?—The report of the inquiry.

1191. Held by whom?—A magistrate, with two assessors—ship-masters.

1192. I only ask you because, perhaps, we might be able to get that report?—I could get that report, I have no doubt, from the owner of the "Brinkburn," who lent it to me.

1193. I daresay the Board of Trade will be able to get it for us?—It is the "Alva" and "Brinkburn."*

1194. (*Rear-Admiral Andoe.*) I would ask you a question on that point, as I know these waters. Are you aware that a ship is sometimes completely out of control in Charybdis in the Straits of Messina?—I can quite believe it.

1195. Absolutely out of control. You will see a ship swing round eight points and back again?—I can quite believe it; I have seen a ship swing round. I would observe that in this case the ship was swayed by the eddy so as to be brought nearly, but not quite, end on to the other steamer.

1196. I merely mention that as showing it is not a particularly valuable instance, on account of that ship probably not being under control at all?—Well, its value, of course, would depend upon the credit that is given to the statement that she was nearly, but not quite, end on to the other ship; because, if she was only nearly end on, then the argument from this case is in favour of fine convergence.

1197. (*Chairman.*) You say, the finer vessels are screened, the less chance there is for such an accident to happen?—Yes.

1198. (*Sir E. Harland.*) Before this excitement outside upon this Order in Council, did you or did any of your friends, or your marine inspectors, know anything precisely as to the way your ships had been screened up to that time?—I am afraid not. I am afraid they relied a good deal upon the Board of Trade surveyors, but they must have attended to it themselves also, because, as I say, in every case the chocks had to be pared down; so the lights must have been more finely screened before.

1199. You refer in every case to your own vessels?—Yes, to our own vessels.

1200. That is to say, in no instance in your vessels had there been one that had been screened to more than 4°?—In no case had there been one screened to as much as 4°.

1200*a*. To as much even?—Yes.

1201. Then you cannot speak of vessels in your own service as to any objection that there had been to the screening before that?—No.

1202. Then, consequently, you are surmising, or your officers are surmising, that when screened as now to 4°, it is dangerous?—No, I do not think we are merely surmising. Captain Ruthven, who is our senior commander, has paid a great deal of attention to the subject, and has made experiments with his own ship and with other ships. He has written papers on the subject in the "Nautical Magazine"; he is to appear here as a witness, and I think he will be able to put the matter beyond surmise.

1203. You have read some of the returns† made by the Board of Trade officials as to vessels in the London district; have you any reason to doubt that return which shows 5°, 6°, 7°, or 8°, being correct?—I think I said something about that before. I would not put too much reliance upon their accuracy, but I think they are substantially accurate; at all events, they show quite enough to establish that things were in a very bad state; that there was a great want of uniformity, and all sorts of divergences and convergences, and all sorts of irregularity; it must have accounted for a great number of collisions, and for a great deal of what has been considered false swearing in actions in the courts.

1204. Now, there is a class of pilots who take every class of ships into port; have you heard that they have every complained of this order?—Yes, I hand in a protest‡ signed by the whole of the Trinity House pilots, I think, of London.

1205. And do you think that they have not been aware that the screening in some cases used to be

* *See* Appendix 5, No. 3.
† *See* Appendix 2, Nos. 2 and 7.
‡ *See* Appendix 6, No 2.

*Mr. J. G. S. Anderson.*

2 May 1895.

much wider?—What they have said to me is that the screening used to be finer when they were young pilots than it has been of recent years. I have pressed them to say whether it was since 1893 that the screening became coarser, and they have replied, "No, it was before that that it got bad."

1206. Would not that bring us to a period when there were literally no chocks whatever on the ends of screens?—I think it brings us to the state of matters which is disclosed by these statistics. The thing was not being attended to, and collisions must of necessity attend such a condition of things.

1207. Have you recognised that there was a time when there were no chocks on the end of the screens. Does not that point to the lamps having been screened then to a very much coarser angle?—Well, they have some ways of making screens so that you can dispense with the chock, and still get the effect.

1208. Is not that rather a modern plan of making the screen in two—having the screen double?—Yes.

1209. But do you think that was in use at all, or in practice 20 years ago?—Well, that I do not know. I have not gone back. I believe the whole use of side lights is comparatively a modern thing.

1210. You referred to a very old practice of having the lights really on the bow, almost side by side to each other?—Yes.

1211. Have you any historical knowledge that it was once the practice of the Navy, for instance?—No, I have not.

1212. Then you refer to it as having been in practice at some time or other?—Yes, I was aware it had been.

1213. And you also referred to it as not having been a bad plan?—Yes, in many ways.

1214. If it were adopted again?—Yes.

1215. But in that case did you think of the impossibility of carrying the lights at the bow, or did you look to the danger of the screens being carried away from the bow of the ship?—Yes, I do not advocate it at all. I do not advocate the placing of the lights on the bow for many reasons—that is one—the risk of their being carried away, and the risk of their being obscured by spray, and so on, and because they are away from under the eye of the officer on the bridge. I like them to be on the bridge.

1216. That is why I gave you the opportunity of qualifying that statement?—Yes, I did not mean that to be taken literally.

1217. Have any of the lights in your line of steamers duplex burners, such, for instance, as you have in your own house, possibly, for oil lamps?—No, I do not think so. I think they are two wicks.

1218. Merely one wick?—Two wicks.

1219. That is what I mean?—I think that all, with the exception of the vessels lighted by electricity, have two wicks.

1220. You are not aware that you are in the habit of using that class of light?—I think we are using mostly electric light now—I think so

1221. Take the electric light. You have been referring to the angle of screening being taken from the inner edge of the wick?—Yes, I recommend that.

1222. The line from the inner edge of the wick being practically parallel to the line of the keel?—Yes.

1223. And there would be sufficient light from the width of the wick?—Yes. Would you allow me to add that what I meant to say was that that is a practical and intelligible order to surveyors, because it gives the full light of the lamp ahead of the lamp to a line parallel to the ship's keel, as required by the Act of Parliament; but not beyond that line.

1224. Putting the Act of Parliament upon one side—would you recommend screening from the inner edge of the wick?—Well, that is why I should like experiments conducted, not from a foregone conclusion, as was the case, it seems to me, with Sir Digby Murray and Mr. Samson's experiments at Shoeburyness. It appears to me they got 25*l.* to make experiments of a definite kind, but they went and spent it in doing something else—they went with a foregone conclusion as to what was desirable, and then proceeded to make the experiments. I cannot see that they ever tried to see whether 2° of convergence would do. They went with the foregone conclusion that it was to be 4°. I should like to see the experiment tried. I am satisfied the finer the angle can be made and the less you see the light across the bows the better. At the same time, you require to see sufficient light ahead of the lamp itself. I should like to see experiments made, as I say, not with a foregone conclusion starting with 4°, or any other number of degrees, but beginning with one and going through the whole gamut, and seeing what is the finest you can get.

1225. What angle would you recommend from the centre of the electric light?—I have not conducted any experiments. The electric light is very much stronger than the oil light. Those rays that escape from the outside edge of the wick do not penetrate very far, and instead of that region of doubt being a triangle, it is more a parallelogram.

1226. That is from the electric light?—No, from the oil light—from its convergent rays dying out. But with the electric light, the penetration of what did escape from the chock across the line of the ship's keel would carry the crossing rays very much further. I think special experiments ought to be made with the electric light.

1227. You would anticipate that for the electric light the chock should be thicker—that the angle should be made finer?—I think that the greater penetrating power of the electric light would carry the region of doubt perhaps three miles away from the ship. That is what I should expect to find.

1228. (*Chairman.*) There was one question with respect to the statement as to the conclusion to be drawn from the protocol of the proceedings at the Washington Conference. Captain Mensing* is reported to have said:—"There is very little more "to be said, except to explain how we came to "adopt the angle of half a point. As far as I know "there are only two countries in which the rule "where the lights should cross each other before the "bow is accepted. One is Denmark, in which "country the distance is settled to be about a cable's "length, which would be 185 metres, so the angle "would be much less than the one which we propose "now; and the other country is Great Britain. "There is a table here from which I get the French "translation, in which it says that, for the beam of "a ship 20 feet broad, the shortest distance at which "these rays should cross each other is about 200 feet; "that is to say, the rule laid down by the Board of "Trade comes practically to this, that, at the distance "of 10 beams, or ten times the breadth of the beam, "there should be a distance before which these rays "of the side lights should not cross. That makes a "half a point." I presume it was some passage like that which you had in your mind?—Yes, I could hand you in a statement showing how that point has been worked out; but Captain Ruthven, the gentleman who pointed out that blunder of the Washington Conference, is to appear before you as a witness, and you will have an opportunity of asking him to explain it.

1229. (*Captain Hallett.*) Are all your lights of one pattern?—I think so.

1230. Because it makes a great deal of difference whether your wick stands *that* way, or whether it stands *this* way?—Whether it stands at right angles to the line of the keel, or an angle of 45°.

1231. And some even stand more?—And some are not in the centre of the circle.

1232. And some of them are in the same circle?—Yes.

* *See* Parliamentary Paper, C. 6255, p. 189.

Mr. JOHN CORRY called and examined. *Mr. J. Corry.*

2 May 1895.

1233–4. (*Chairman.*) I think you are a shipowner?—Yes, of long standing.

1235. And managing owner of Messrs. James P. Corry and Co.?—Yes.

1236. And you have had considerable experience in shipping matters?—For upwards of 40 years.

1237. Have you considered the question of side lights?—Yes, I have.

1238. I think you have given attention to the subject of the proper screening of side lights, and also the best method of fitting side lights to large sailing ships and steamers?—Yes, I have given considerable attention to both.

1239. What, in your opinion, was the cause of want of uniformity in the angle of screening? I think the main cause of the divergence has been the improper placing of the light. I think I could better illustrate what I mean by showing you this diagram of an ordinary side light. This side light is of ordinary construction, and is about as small as the regulation would admit a light to be made. According to my judgment, the proper position for the light is in the centre of the lamp, in the focus of the lens. This lens in the ordinary case is made one-third of a circle—120°. That is for convenience in construction. I may just state that those who go in for perfect lenses make them of a somewhat larger arc; but I am now taking what is simply an ordinary side light used in the mercantile marine. The proper position, to my mind, for that light is in the centre of that lens, and that would allow the whole width of the wick, or more correctly the width of the flame of the wick, to show right ahead; and the proper screening for that light would be a line drawn from the inner edge of the lens parallel to the keel.

1240. From the inner edge of the lens?—Yes. You have then, of course, the light of the flame itself converging; the whole of that light is shown right ahead, and to my mind anything more than that is quite unnecessary—in fact, misleading. But you ask the question how is it that there has been such great discrepancy in the screening? It is simply because the light has not been maintained in its proper position. You will find side lights in which it is very improperly placed. You will find the light *there* or *here*, or *there*. (*Describing on the diagram.*) In fact, everywhere except in the right place; and, of course, if you shift the light one way, you get one screening, and if you shift it another you get a very different screening. Under the old Board of Trade regulations the practice until very recently was that the inner edge of the lens should be the point of guidance in screening, that is to say, a line parallel to the keel projected from the inner edge of the lens. If the light—that is, the lamp—was in its proper position, that was a perfectly correct basis to work upon; but if the light was not in its proper place, of course it was misleading. I just refer to this, because it has been stated that this direction of the Board of Trade was a misdirection and was not intended. I know that was not the case, because I practically for the last 30 years have superintended the fitting of these lights, and know what has been the practice in all parts of the kingdom; and I maintain that if the light was in its proper position in the lamp, it was a proper and correct method of adjusting the screening. If the whole of the light is seen right ahead, the international rule requiring the lights to show to two points abaft the beam cannot be absolutely carried out, because the lens would require to be extended about half-an-inch to do so. But this is not, in fact, a matter of very great importance. The important matter is that the light should be seen right ahead. I hold, and in that respect I am borne out by the shipmasters and pilots that I have spoken to, that any greater divergence than I have indicated would be misleading, especially in narrow waters. I think that uniformity should be obtained, but it should be the best possible practice which should be adopted. I hold that if the lamp is screened so that the whole of the wick or the whole of the light shows right ahead, it complies with the international regulations and meets practical requirements. Here are other drawings, which I can exhibit, of larger lamps. (*Another drawing was shown.*)

1241. (*Mr. Bolam.*) Would you say whether this is a diagram of an actual lamp?—From a section of an actual lamp. I drew it from an actual common lamp, but a lamp I considered correct as regards its general arrangements. They never measure absolutely the whole 120°, because there is a certain amount lost in the cutting of the lens. In this case it is only about the eighth of a degree. Here is another system of fitting which I advocate personally, This is a section of a lighthouse about 3 feet in diameter; and in this, instead of inserting, as usual, pieces of glass and the lamp swinging inside, I advocated fixing the lens into the lighthouse in a brass casting; in fact, making the lighthouse an integral part of the lamp, and having this swinging lamp inside. The advantage of that is, it adapts itself to the roll of the ship, and the light remains vertical. The centre of motion is the centre of the flame. The object of this is to preserve the chimney, because, with these duplex burners, except the flame is kept vertical, the chimney is sure to crack; with this arrangement they do not crack, even in the worst weather. In fact, I have cases in which the same chimney has been two or three voyages without cracking. Here is another diagram. That practically shows another view. That is the vertical height of the lens, and the centre of the lens, you see, coincides with the flame. This is introduced in a lamp inside the lighthouse, and forms an integral part of it. The advantage, as I consider, is that you have not the two thicknesses of glass for the light to pass through, and also that you can more accurately fix the screening.

1242. (*Sir E. Harland.*) Is this for the pitching or rolling?—The rolling, mainly.

1243. (*Chairman.*) Does not the pitching throw the light down?—No, the pitching in a long vessel has very little effect.

1244–6. Not enough to throw the flame on to the glass?—No. This system to a certain extent obviates the effects of both pitching and rolling. In going round the Horn in the wildest weather we have no trouble. We never have to trim the lamp for 16 hours. You can make the lamp as large as you like, and for the time it is burning it requires no attention. Of course, being in the lighthouse it can be looked at. This door opens, and the reflector is fastened to the door, so that when you open the door you see that the lamp is burning properly, and when the door is shut the reflector is in its place.

1247. (*Rear-Admiral Andoe.*) Could it be adapted to an ordinary lamp?—No, it would be rather cumbersome. You want something like a lighthouse to carry it in.

1248–50. (*Captain Castle.*) You are not speaking of sailing ships going round the Horn?—No. I have fitted it in sailing ships, but they are of a large size; but in a small lighthouse I have not.

1251. (*Chairman.*) The last witness, Mr. Anderson, told us that the edge of the wick and the edge of the lens, in his view, would practically mean the same thing?—Yes, if the lamp is properly constructed, as shown in the diagram I have here.

1252. In this case it is the same?—Yes, and it would always be the same if the lamp were properly constructed. The edge of the lens and the inner edge of the wick or flame practically coincide; the flame would be somewhat larger or wider than the wick.

1253–7. If the two things mean the same, one can understand how in the Board of Trade regulations one phrase might be used which practically is identical with the other?—I have no doubt whatever when the

*Mr. J. Corry.*

2 May 1895.

regulation was first got out that with a diagram like this, and with the lamps that were then in use, the two phrases were identical. They took the lens because it is much easier to measure from the lens than the wick; but when measuring from the lens they ignored the necessity of seeing that the wick was in its proper position.

1258. (*Chairman.*) I should like to put to you two things which have been urged by the Board of Trade surveyors. Supposing the screening was exactly as you have shown it was in theory, there is the long dark space corresponding between the distance between the lights; do you think there is any objection likely to arise from that?—None whatever. You see even in *this*, or in any light, there is a convergence of the width of that flame, which is about an inch and a quarter, in 3 feet. If you go 400 to 500 feet ahead of the lights, you would begin to see both lights. I hold it would practically be an advantage in narrow water if you would not see them, because you would know exactly what side of the vessel you were on.

1259. You agree that it is important that ahead of the ship or ahead of the light (whichever you take the words to mean) there should be a uniform strong light?—The whole width of the light should be shown right ahead.

1260. Now I do not know if you are aware that according to the experiments of the Board of Trade, lights so screened can be hardly said to show quite their full strength right ahead of the lamp. I do not know if you have seen those experiments?—I have not seen them, and I do not credit it.

1261. However, you think in practice that if the light is so screened, as it certainly should be in theory, it would show an unbroken and uniform light right ahead?—I have no doubt it would; in fact, I have tested it in our own vessels, the length of a ship ahead, and as far as my eye could judge, there was absolutely full light. When I went a little to the one side, I could not notice any difference in the volume of light, and, of course, right ahead we saw the whole light.

1262. Now the other point that is pressed a great deal by the Board of Trade, as I understand it, is the necessity of keeping to the full meaning of the rule, "green to green, red to red, perfect safety, go ahead," Now it is suggested, as I understand, by the Board of Trade, that if the lights are screened to a small angle, that that rule ceases to be a rule of practical safety. I do not know if you fully follow exactly how the matter is put?—No, my reading of it would be, if you screen to a large angle you get into a mess at once.

1263. Put it in this way, supposing one vessel is a little on the starboard bow of the other, now in that case if the lights are screened very fine, in theory at any rate, the vessels might approach each other on absolutely parallel courses green to green, and yet there might be a collision?—It would be very difficult for anything of the kind to occur. I do not see any necessity for it, because you have the whole volume of the light. The man knows he must not shave too close. You must give a certain amount of space for clearance, and no one would come absolutely close. You know even the side light is not placed in the extreme width of the vessel. I think such navigation would be utterly reckless. It would be a blunder.

1264. You would say a man ought to keep his eye on the light, and if he found it was not altering he should give a touch to his helm and keep a wide berth?—Yes.

1265. So that, supposing the lights were screened finer, you would not anticipate any danger occurring?—No.

1266. (*Captain Thomson.*) Although the ships would both practically be breaking the rule of the road?—The rule of the road must be taken in a wide sense; "green to green" is simply a rhyme—the rule of the road rhymes may have been devised to simplify the rule of the road; the true rule of the road is to keep clear of one another.

1267. (*Chairman.*) What Sir Digby Murray says is, if you get the vessels in that position so that they advance on parallel courses they would strike one another?—Yes.

1268. And they would be green to green in the sense that neither vessel would see the red light of the other, but each would see the green. Under those circumstances Sir Digby Murray says it is a position of danger, because if they both go on there will be a collision, and at the same time there is no rule to govern this case; therefore, he says that the lights ought never to be screened so fine as to give that condition?—Green to green is simply a rhyme. It is no rule of the road. The main rule of the road is to keep clear, and those orders are merely indications of what is considered a safe line to go. The main rule of the road is to keep clear.

1269. (*Mr. Bolam.*) Is that case not sufficiently met by the general direction in the regulations, which says that nothing in the regulations is to excuse an officer from neglecting any precaution usual among seamen?—Of course that overrides anything of this sort.

This further diagram indicates a section of one of Harvie's lenses, the maker in Glasgow, who is considered to be the best maker of lenses, and it is rather in excess—about $\frac{3}{4}$ of an inch in excess—of the 120°.

1270. (*Sir E. Harland.*) Is the film of the red glass part and parcel of the red lenses?—No, it is on a separate thin piece of glass in contact with them. It is simply a surface colour, not carried through the thickness of the glass.

1271. (*Mr. Bolam.*) There is a little just cut off here by this part?—It is infinitesimal—it is practically nothing.

1272. I think this was to give the full measure of light ahead which Harvie's lamps do give—those of the later construction?—Yes, we have bevelled this so that as little of the lens as possible is observed. This opening is for replacing the lens in case it breaks; but in eight years we have not broken one, and that has been round the Horn, so that practically it is as safe as it can be.

1273. (*Sir E. Harland.*) That little bit here is to make it correct?—Yes, the lens is, perhaps, 130°, or rather more.

1274. Is this full two points here?—That is, practically, two points. He has tried to conform as near as possible with the regulations. These lenses, of course, are expensive, and would cost more than an ordinary side light. They are all polished and ground; but, of course, the first cost is a small item in the price of a ship.

1275–6. (*Captain Hallett.*) In the first lamp you have shown us, have you found any difficulty with the dirt on the corner of the lens?—Well, they must keep them clean—it is a simple matter to do, but if a fellow is painting his light-house, and he makes a smear of paint along it, of course, it would interfere with its efficiency.

1277. (*Captain Thomson.*) Would you ordinarily expect to find no dirt?—You can let a window get dirty, of course. Any ordinary window will get dirty, but you can keep it clean.

1278. (*Rear-Admiral Andoe.*) In the Board of Trade Regulations of 1875 it distinctly said that the line drawn from the inner edge of the wick to the outer edge of the chock was to be parallel with the line of the keel?—Yes.

1279. In the later instructions the inner edge of the lens only was mentioned?—Yes.

1280. Well, that altered the condition of things entirely, because if the lens were made less than a third of the circle it might be very misleading?—But, excuse me for one moment, they do limit it. That is one point that the Board of Trade do pay attention to. They did measure the size of the lens.

1281. But many of the lenses are now, I believe, rather larger than that lens?—I do not object to that.

1282. And overlap considerably on the inner side?—This is the largest lens made for any purpose that I know of.

1283. I think we had others before us larger than that?—I am not sure. This is Harvie's lens, which fits his largest lamp; others are made specially, but not, I should think, for trade purposes. In the case of this other diagram on the table, if the light were screened from the inner edge of the lens, the rays of the light would cross at a very considerable angle. But you see that light is placed absolutely in the wrong place.

1284–6. But then, in practice, is it not often the case that the light is in the wrong place?—I have said that that is so.

1287. Would it not be safer to ignore the rays and to measure always from the wick?—Certainly, I advocate measuring from the wick, but what I wanted to point out was that the old instruction, which was taken from lamps properly designed, was not an improper direction, because when lamps were first made they were made on an uniform pattern. There is no question about that. There was some attention paid to the construction of the lamp as regards the design, but the repairing of the lamps now has got into the hands of every tin-smith in the country, and he places the lamp or wick according to his fancy, and the result is that it is put two inches out of its place.

1288. (*Rear-Admiral Andoe.*) In practice, we know seamen are to a certain extent careless, and not particularly overlooked, and consequently, perhaps, the lens has a quarter of an inch of dirt and grease upon it; would it not be much safer if, say, you had an inch to spare in that lens, so that there would be no interruption of the rays, especially right ahead. That is the most important point, perhaps, as viewed by seamen?—You would require your screening to be very correct indeed.

1289. And you would require your lens to be very clear?—It is quite possible to carry out your idea, and you have a full lens if you like, and screen it properly. It depends upon the screening. To avoid any dirt lodging there, you had better give it a little more than the 120°; but, with the lamps designed and made at present, 120° has been selected, because you get three lenses out of one circle.

1290. If you were to cut off a quarter of an inch to allow for dirt and obscurity, you would not get the whole of the light right ahead; it would obscure a very important part of it?—You cut off that quarter of an inch, of course; that is all you do cut off.

1291. Then take the line from *there;* it would bring the line out in that direction?—You would lose that quarter of an inch, but that, as I say, is like dirty windows, and you have no business to have them dirty.

1292. In practice, however, I am afraid that is the case?—Well, I have not found it so in our own practice.

1293–4. Is there any other reason why the lens should not be made larger?—None whatever, it is only a matter of expense. When once you make a lens anything in excess of the 120° it adds one-third to the cost of each lens.

1295. I see you admit that all lenses made on that principle are really short of what they should be?—Somewhat, but I cannot say it is of very much moment, because it simply takes a small fraction from the two points abatt the beam, which I do not consider of any practical importance.

1296. (*Rear Admiral Andoe.*) Theoretically, it does not quite comply with the instructions?—Theoretically it does not; this other lens does.

1297–300. (*Captain Hallett.*) Do you put that wick at any fixed angle with the fore and aft line?—I think that is considered an important matter by the Board of Trade, but I put it through the centre.

1301. What is the angle between the two—the one drawn on the edge of the wick, and the one from this edge of the wick passing the edge of the screen?—It would be about one and a quarter inches on three feet, it would be about half what the Board of Trade at present requires.

1302. That is the whole width of the wick?—Yes, one and three-quarter inches.

1303. That would give you athwart ship a length of about one and a quarter?—About an inch and a quarter full. But I may say that this is drawn to the old colza wick—the original wick—that is out of date practically. I do not suppose there is one colza lamp fitted in a hundred. It is simply for the purpose of the Board of Trade Regulations; the inch paraffin will practically give the same width of flame. It is more like a gas flame, swelling out. This duplex burner would give about one and a half inches.

1304. Screening as you do from the inner edge of the wick to the inner edge of the lens, and so right ahead, does not that plan give a very much larger range for lamps that do not conform to that pattern. I mean with the screen he would put it would come out here at an angle of anything, if you screen from the inner edge?—It will not make very much difference whether I put that wick absolutely so. The flame will not be very much different. It is like everything else. In the construction of lamps there is a right and a wrong way, and I have considered, and do consider, that to place it in *that* way is the proper position.

1305. It gives a maker who is not careful to make his lamps the idea that by bringing the wicks out he may accomplish what is required as to screening?—If you do not put the wicks in their proper place, simply turning the wick round will not do.

1306. If they are triplex instead of duplex this would be practically a circular light?—Yes. Well that is practically a circular light. We treat them as circular lights and give an inch and a half practically; it is a duplex light; if you look at it it is practically a circular light.

1307–8. Have you any experience of the electric light?—No, not practically; although my knowledge of electric light is not great, I have no objection whatever to put it in, only in a fog I prefer a duplex burner.

1309. You have never tested it?—No, but I would advocate the use of electric light where you had it in a ship, although for fog I would always rather have a good oil burner; it is very much more effective in fog.

1310. The use of electric light increases your range to such an extent as to increase your width of field?—But I do not see any objection to seeing seven miles off if you can.

1311. You widen your field there and it widens your danger there. I only want to know whether you have tested it?—No, I have not tested it, but in the ships fitted with electric lights, passenger ships lit up with the electric light, I think the glare of these lights takes away from the absolute light of the side light.

1312. I know you cannot see them so well?—It is important they should be seen.

1313. A ship, an American liner, is such a blaze of light, that you cannot tell whether it has lights or not?—Well, but you see other lights as well.

1314. (*Captain Thomson.*) I think you said colza oil is practically out of date?—Practically.

1315. Is it not still used in lamps to a great extent?—I think we kept to it as long as anyone, but we have given it up many years; we consider the paraffin infinitely superior. We carry colza in case of accident. We have a colza lamp, but never use it. We have colza lamps fitted as well as the duplex burners; we have never used the colza lamps.

1316–20. Are not all the better class of side lights fitted with a second set of colza lamps?—I cannot say. I must just mention that has been one cause of a great deal of improper fitting. The first lamps that were used were colza, and then, when they introduced paraffin, they put the paraffin burner on to the top of the colza lamp, and that raised the light perhaps an inch and a-half.

1321. (*Mr. Bolam.*) You have screened by this diagram from the inside of the wick?—Yes.

1322. That is in order to control the full value of the light?—Yes.

*Mr. J. Corry.*

2 May 1895.

1323. Do you think it is of greater importance to control the full value of the light, or to control the reduced rays?—I do not understand.

1324. If you screen from the inside you then control the direction in which the whole beam shall go; but you leave the outer edge to cast at various angles, depending upon the amount at which the wick goes out?—You cannot avoid that.

1325. You must either control the inside or the outside?—Yes.

1326–8. Do you think it more important to screen from the inside, or screen from the outside, or do you think it better to have control of the whole beam, leaving the outside rays to take care of themselves?—You cannot screen except from the inner edge of the wick, or the inner edge of the light, wherever it is.

1329. The regulation gives instructions about the uniform and unbroken light showing over a certain number of points, and say nothing whatever about the rays which may cross from the outside of the wick—the regulation speaks about the uniform and unbroken light; now, to comply with the regulations, is it better to screen from the inside which enables you to turn the whole beam any way you like, or to screen from the outside which makes the full force of light turn at various angles?—I think in many respects the inner point is the correct one.

1330. If you were drawing the instructions you would rather instruct the surveyors to screen from the inside than the outside?—But I would have to see that the lamp was properly designed. They are points to be considered.

1331. In other words, you would rather give instructions to screen from the inside than from the outside? Yes.

1332. (*The Chairman.*) If you screen 2½° from the inside with a 1-inch wick it is about equal to screening 4° from the outside?—Yes.

1333–4. Then does it really practically matter whether you screen from the inside or the outside?—If the screen is in a line parallel to *that* it would make no difference, but if you cut it off the lens, then you will have to screen more.

1335. Does it very much matter whether you regulate by the inner edge of the wick or the outer edge of the wick?—No, not if you determine the convergence.

1336–9. (*Mr. Scrutton.*) I want to get one matter right. It will be remembered Sir Digby Murray, in answer to question 99, says,—"The wick is "sometimes at right angles with the keel, and it is "a question whether it is better to have it parallel "to the chord of the arc or not. I have not made up "my mind, but I know that my colleague, Mr. Samson, "who has assisted me, is very strongly of opinion "that the wick ought always to be at right angles to "the keel?" I should be sorry for Mr. Corry to go away without giving us his opinion on this point?—At right angles to the keel, I know, has been advocated.

1340. You adhere distinctly to that position?—Yes, because it is a correct view.

1341–4. (*Sir Edward Harland.*) Would you recommend that the centre of the light, or the wick, or the centre of the lamp, should be dealt with, and instructions be given to deal with the centre of the light rather than the side of the wick, not only in the making of a lamp, but also in screening the light; that they should simply deal with the centre of the wick rather than with one side or the other?—I do not think, practically, it would matter at all. Theoretically, of course, the centre of the lamp is the centre point of convergence or divergence, and it is a measurable quantity, perhaps more accurately measureable than the edge of the wick. I think, as a practical instruction, as it were, if you say that the chock shall be ⅝ths or ¾ from the centre of the wick, the instruction would be as full as necessary.

1345. (*Sir Edward Harland.*) And also in the matter of lamp making?—You could do that as well.

1346. This lamp appears to be a circular one, but in many cases the lamp is a square one, and if the lamp maker were told that the centre of the wicks must be in the centre of the lens, do you think that that would be a means of making the lamps more accurate?—I do not think there need be any difficulty if the proper points were given out, and proper diagrams were made, showing where the lights should be, but I would not confine them to one pattern, because some might prefer a round lamp to a square one.

1347. Supposing the screen had been originally fitted for colza or American oil, from the centre, and then the electric light were introduced, still the same screening would be correct?—Yes.

1348. You have evidently in these drawings been alive to all that?—Yes.

1349. Are you able to say whether the duplex is adopted by most of the owners of large ships?—I would not absolutely say, because this is a special thing of my own, and I designed it for our own ships. I should fancy it is not uncommon to use the duplex burners in large lamps, but except there is some special design to dispense with chimneys, I think they would find a little difficulty.

1350. (*Chairman.*) How would the swinging of your lamp affect the angle of the screening?—Not at all. You see the centre of the light remains absolutely stationary—the light remains stationary—the lamp swings, but the light practically remains in the centre.

1351. (*Rear-Admiral Andoe.*) It is so near the point of screening?—The centre coincides with the centre of the flame, so that, theoretically, it would have to swing to a very great angle. The point must be concentric with the flame, that is the object of this piece, and if you want to fix this lamp, you have simply to screw *this* in.

1352. (*Sir E. Harland.*) Is that a special design made for your own ships?—Yes.

1353. And you are not aware of any being made for any other ships?—No.

Mr. Thomas Scrutton called and examined.

*Mr. T. Scrutton.*

1354. (*Chairman.*) I want to ask you one question, Mr Scrutton. I think you have been kind enough to make a note of what is your practical experience with regard to lamps?—I have. Lamps for the Merchant Service are now almost universally made to burn paraffin with a 1-inch wick and chimney. When a stronger light is wanted, two wicks, each 1-inch, are fitted to the lamp. A wick to burn colza is often supplied in case Government stores are taken. The wick is then 1¾ inches. Or two wicks each 1-inch, as you will see on this diagram. [*A diagram was put in.*] There is a sample lamp with both kinds of wicks placed on the table.

## Wednesday, 8th May 1895.

PRESENT:

THE RIGHT HON. SIR FRANCIS H. JEUNE IN THE CHAIR.

Rear-Admiral ANDOE.
Captain WILSON BARKER.
Mr. BOLAM.
Captain CASTLE.
Captain HALLETT.
Mr. SCRUTTON.
Captain THOMSON.

Mr. C. HIPWOOD, *Secretary*.

Mr. WM. HY. COLQUITT called and examined.

*Mr. W. H. Colquitt.*

8 May 1895

1355. (*Chairman.*) I believe you are a first class Liverpool pilot, and Vice-President of the United Kingdom Pilots' Association?—Yes.

1356. I understand that you have been appointed to give evidence before us as to the views of the Liverpool licensed pilots with reference to the screening of side lights?—Yes.

1357. How long have you been a licensed pilot?—22 years.

1358. How long have you had a first class certificate?—For the last 17 years.

1359. How many licensed pilots are there for the district of the port of Liverpool?—About 220, varying daily.

1360. What is the view held by the Liverpool pilots as to the manner in which side lights should be screened?—We say this, that there should be absolute uniformity, international uniformity, and secondly that the angle of screening should be reduced to the lowest possible minimum, and we submit for the consideration of your Committee that 2°, in our opinion, is quite sufficient for all practical purposes. We would rather have it reduced to nothing, but we can see a difficulty in that direction; we submit that 2° is quite sufficient.

1361. (*Captain Castle.*) From the outer edge or the inner edge of the wick?—From the outer edge of the wick.

1362. (*Chairman.*) Why do you and the pilots object to the crossing of the side lights?—We object because on account of the lights crossing the bows any change of course in a vessel showing the lights is not immediately indicated. If two vessels are approaching end on to each other, or nearly end on, if the lights are screened at an angle of 4° both vessels will have to port 4° before they lose sight of the other vessel's starboard light, and this is an unnecessary divergence from course. Then again, if vessels are passing each other starboard side to starboard side all clear, owing to the crossing of the lights, they are each misled into believing that the other vessel is approaching end on. If two vessels are passing starboard side to starboard side all clear, certainly they will pass close to, but clear. If the lights are screened to 4°, the vessels appear to be approaching each other end on, whereas, as a matter of fact, they are passing starboard to starboard. The result of that would be, in practice, that we have to port our helm, and bring both ships close together instead of keeping them apart, and each vessel will cross the other's bow. Take it the other way. Supposing I am approaching another vessel nearly end on, port side to port side, going clear, and I see the other vessel's starboard light, I shall have to port still further, as the rule directs me to. This would be dangerous in narrow channels, as passing unnecessarily clear of one object would throw you too close to another. And when you are going to sea against a 6-knot current a divergence of 4° of course would have as much effect as a full point, and that makes a very important difference in narrow waters.

1363. You know the Board of Trade attach great importance to this, that if the vessels are screened very fine, you might be green to green, starboard to starboard, and yet in a position which would be one of danger if the vessels kept their courses. Do you follow me?—I am trying to follow you. I think I do follow you. What you mean is this. If the vessels are passing each other starboard to starboard, green to green, of course they can pass each other if the light is screened rightly.

1364. No. I think that is precisely the point to which I wish to bring your mind. What is suggested, as I understand it, is this. Supposing the lights are screened very fine, there might, in fact, be positions in which the vessels would be green to green; that is, neither would see the red light of the other, and yet if they kept on their courses, without altering, they would not go clear?—No, sir, I do not agree with that view.

1365. I dare say you will admit that it is so in theory?—It is not within my experience; if a vessel has his starboard side pointing to another vessel's starboard side, of course they must pass clear.

1366. That is your view?—That is my view.

1367. But you know, that is not so strictly as a matter of theoretical calculation; if you screen vessels to 1° or 0°, it is possible to place them in a position where neither would see the red light of the other, and yet they would not go clear?—Well, you would have the masthead light to indicate the position of the ship.

1368. Yes, that may be?—The masthead light would indicate the position of the ship; I think I grasp what you mean; it is about this dark line, is it not?

1369. Let me illustrate it to you, because I want to have your view (*describing with models*)?—It is so. Yet the case would never occur in practical navigation.

1370. In theory, that is so?—It is in theory so, but that is not starboard side to starboard side, but starboard bow to starboard bow.

1371. (*Rear-Admiral Andoe.*) May I ask why it would not arise in practical navigation?—Because the slightest alteration of the helm would make it impossible.

1372. Because the green light shows across, and you give your helm a little touch in time?—Yes. You could not possibly steer two vessels so fine. Of course, I admit it is starboard bow to starboard bow, but in practice it would not occur.

1373. (*Captain Castle.*) In practice you would starboard?—Yes.

1374. (*Chairman.*) Supposing you were in that position, and you saw the other vessel approaching in that way?—No sailor ever steers like that.

1375. Would you consider it your duty to starboard?—Yes.

1376. You would also have the masthead light to guide you?—Yes.

1377. Do you think the Order in Council of January 1893 has, in fact, increased the crossing of the lights?—Yes, it has in many cases.

1378. But in some has it not also diminished it?—I believe it has.

1379. In your experience, what did pilots and shipmasters understand the rule to be before the Order in Council?—We have always understood that the expression "crossing the bow," meant crossing the path of the ship, a line projected ahead of the line of the keel. We never dreamt it meant crossing the ship's deck, crossing the ship itself.

1380. You understood crossing the bow to be crossing the projected line of the ship's keel?—Just so.

*Mr. W. H. Colquitt.*

8 May 1895.

1381. In your experience, was the old rule always observed?—No, I am afraid it was not. I believe the practice of surveyors was different; and some surveyors used to screen the lights one way, and others a different way altogether—I think a most dangerous way. And I am very thankful indeed to the Board of Trade for calling attention to the matter; many collisions which it was so difficult to account for, no doubt, can now easily be accounted for.

1382. Do you mean that collisions have been brought about by the crossing of side lights?—I have no doubt about it. I have had scores of instances within my own experience, where I have been proceeding up my channels, with vessels on my starboard side, where they ported across my bow. I could not understand it at the time, and used to put it down to bad steering or bad look out, or some unimaginable reason. But I can understand now that although I could see his green light he could see my port light.

1383. (*Captain Castle.*) That is due to want of management?—I only know the fact. I do not know the cause.

1384. (*Chairman.*) That is due to what is called the port-helm rule?—I believe the porting has been due to the screening of the lights. I have ported myself, I have no doubt, in many instances when I have had his starboard bow.

1385. I observe you said if you could only see both his lights, and he could see only one of yours, that that would be a more fruitful source of danger for the two vessels; if one saw one light, and the other saw two lights, when they should see either one or two, of course that is a source of danger?—A very fruitful source of danger indeed, I should think.

1386. Can you tell me, in your experience, of any cases you have known of danger arising from the lights crossing?—I know of one particular case. I think it was in January 1893. I could give you the name of the ship only I have not got my pocket-book here which has it in. I was in charge of a steamer coming from Point Lynas up to the North West Light Ship in a narrow channel, and I saw a vessel approaching me with her starboard light in sight some distance away on the starboard bow; I starboarded a little to increase the distance.

1387. When you saw her how did she bear?—About half a point on my starboard bow. While I was in the act of starboarding I noticed the vessel port. She was too close to port my helm, so I determined to keep my helm, and I ordered my vessel's helm to be starboarded, with the intention of passing the approaching vessel green to green, but almost immediately after I had given the order I saw the steamer's red light. In order to avoid the approaching steamer, I continued my vessel under her starboard helm, and the approaching vessel continued under her port helm till we both came right round pretty well stern on. I afterwards happened to meet the master, and to get charge, as pilot, of this vessel that I had met in this way, and I said to the master "Why did you port right across my "vessel, you were going clear?" He said "We were "not going clear, I saw all three lights of your "steamer quite distinctly, and therefore ported, in "accordance with the rule."

1388. So he saw your red light, when, in fact, you were starboard to starboard?—Starboard to starboard we were; and I attribute his having seen my red light to the fact that my red light was so screened as to be seen on the starboard bow of my vessel.

1389. (*Rear-Admiral Andoe.*) Because the lights of the two steamers were not screened similarly?—Just so, owing to want of uniformity in the screening.

1390. (*Chairman.*) Now, just one question about what is called the dark lane—if there is no crossing of the full rays, is there not danger from a dark lane?—No, sir, no practical danger. I have not seen it. I have had experience about this dark lane in taking pilots and putting them on board ships, and I have pulled in a small boat straight for the masthead light, to see if I could find the dark lane out, and in a few cases I have actually gone close up. You can see it, but it is scarcely worth while speaking about. I have noticed it in a tug boat when I have been going up narrow channels. I have seen the two lights and the masthead light quite plain, but suddenly they have become obscured when she has been close to.

1391. Do you attach great importance to the side lights as indicating the change of course, or deviation of the vessel?—I attach very great importance to it. We Liverpool pilots attach great importance to it. I think everything else should give way to that consideration.

1392. As a matter of practical suggestion, what do you think would be the best rule to lay down?—I hardly think myself competent to give an answer on that point, except what I gave in the previous answer. I think 2° of angle would be quite sufficient.

1393. You think 2° would fairly meet the case?—Would fairly meet the case. You can get the full illuminating power of the lantern where you want it. You get more direct light where you want it, viz., right ahead, and the more obscure rays across the bow.

1394. Two degrees?—Yes, 2°. If you have an inch and a quarter wick, you will have all the illuminating power you want, and the fainter rays you may have lightly on your bow. I should think that would meet it. The lights would converge at 14 times the distance between the two lights.

1395. Would you screen to the edge of the wick?—The outer edge of the wick is my idea. I should prefer 2° from the outer edge of the wick.

1396. (*Rear-Admiral Andoe.*) What reasons have you for preferring the outer edge of the wick to the inner edge of the wick?—Because it is the only aspect of the matter I have studied. I know something about the inner edge of the wick; but I think the outer edge of the wick would give us all we want.

1397. You say you prefer the outer edge of the wick?—It would give you the full illuminating power of the lantern right ahead.

1398. And if the wick were screened from its inner edge to the outer edge of the chock parallel to the keel, it would amount to the same?—Just so; exactly the same.

1399. You are giving, I presume, the view of pilots, rather than of the masters of vessels?—I am here to represent pilots alone; but I may say that the views I express agree with the views of every master I have came in contact with.

1400. Where do you Liverpool pilots take charge?—The Middle Mouse, about five miles to the westward of Point Lynas.

1401. Near to the Liverpool Bar?—No, 40 miles to the westward.

1402. You said just now that practically there was no dark lane?—Practically there was no dark lane.

1403. Does that proves that the lights always do cross considerably?—Well, of course, if the lights cross, there cannot be any dark lane; if they cross close enough to the ship's bow.

1404. Is it your experience, as a rule, that there is no dark lane?—I have seen the dark lane.

1405. Within your own experience of many years, as a rule you say there is no considerable dark lane?—There is no considerable dark lane, in my opinion.

1406. Therefore you believe the lights must cross?—I know, as a matter of fact, they have been crossing for years.

1407. In navigating the narrow channels, what is your rule as regards steamers passing each other in opposite directions?—To keep on the starboard hand of the channels in which the vessels are approaching each other.

1408. That leaves you red to red, going up and down?—Just so.

1409. When you see a steamer approaching and showing both side lights, and you consider you are as far over your side of the channel as you consider safe, would you alter your course, or would you trust to the pilot of the other ship keeping clear of you, knowing that the pilots understand how each other will act?—Yes, we should know.

1410. Without considering the steamer's lights?—Without considering the steamer's lights.

1411. I mean the bow light?—No; the first consideration of the pilot is to avoid a collision, even if he puts his ship ashore. If I was going up on my right side of the channel, and I saw a steamer coming down and showing me his two lights, I most certainly would consider it my duty to port still further, even if I ran the risk of going on to the bank.

1412. And going across her bow?—No, I would port still further; therefore I would get her on my right side.

1413. (*Captain Castle.*) That would be going up?—And he would do the same coming down.

1414. (*Rear-Admiral Andoe.*) Then you might put the ship ashore?—Yes, I might.

1415. Would you not trust to your brother pilot knowing perfectly well what you would do?—I do not like to trust anybody where a collision is involved.

1416. You would rather put the ship ashore?—I would rather put the ship ashore than strike another vessel, and then, of course, if I have got aground through the obstinacy of the other vessel, he will have to bear the blame.

1417. In this case you do not take the side lights as merely indicating that the pilot is coming down necessarily on her side of the channel, but you treat them as if you were in the open sea?—I treat them as if I were in the open sea.

1418. Do many collisions take place between steamers at night in narrow waters?—Yes, I am afraid there are a good many. I have no personal experience of them, but there are a very great number.

1419. In the Mersey?—In the Mersey there are, I am afraid.

1420. I mean of ships of considerable tonnage, passing up and down in charge of pilots?—They are not many, considering the enormous number of ships, but still there certainly are a number of collisions.

1421. When compared with collisions which take place in the channel?—Yes.

1422. There are more in the Mersey?—I should think so.

1423. And you attribute that to the crossing of the side lights?—Partly. Of course it is due to many causes, a collision is; but I think it is partly due to the crossing of side lights.

1424. Do not pilots very frequently in navigating narrow channels, if they think action should be taken by the other ship, call one another's attention by blowing the steam whistle?—Yes, but we are rather averse to that in Liverpool, we are afraid of the confusion. We do not do it except as a last resort.

1425. You do do it?—Yes, but it must be a very extreme emergency.

1426. If she is going to pass you too close you do it?—Yes, in an extreme emergency.

1427. So as to give her a hint?—So as to give her a hint to go further away.

1428. Before the 4° regulation came out were you aware that the rays of the side lights always did cross?—No, I did not think they did. I did not personally. Before the Order in Council of January 1893, I was not aware of any crossing.

1429. Do you know that a very large percentage of the vessels that sailed from Liverpool had their bow lights screened to considerably more than 4°?—I am told so. I was not aware of the fact.

1430. You were not aware of it before?—Not till this inquiry. I have no knowledge of it myself.

1431. Now, for the safe navigation of ships, are you of opinion that the bow lights should be screened so that the full power of the light should be seen right ahead—as fully as on the bow, for instance?—Certainly. Yes, I think that is desirable.

1432. Are you aware that it is practically impossible to have a full light right ahead, unless some of the light is allowed to cross the bow?—A certain portion of the light's rays.

1433. (*Captain Thomson.*) You said you were in favour of an international uniform rule?—Yes.

1434. That, as I suppose, is because when you meet a foreign ship you want to be certain her lights are screened the same as those on your own ship?—Certainly, I want to know how to deal with her; I want to know my difficulty. I might pass one vessel with the light screened at an angle of 6°, and another at an angle of 2°, and another at 1°, and you cannot tell at night whether she is a Belgian, an Englishman, or what she is.

1435. Do you consider that in the case of meeting ships, 600 yards would be a critical distance?—Yes, it is time to do something when you are within 600 yards.

1436. In ordinary ships it would not be necessary to do anything before that distance—say 10 knot steamers?—I think the duty of a proper seaman is to take proper precautions immediately he sees the light, even if it is five miles off.

1437. I say "necessary." You do not think it is necessary to port your helm five miles off?—Yes, if I saw a vessel five miles off, and saw her side lights, I would port a degree or two.

1438. You said you thought 2° a safe angle of screening from the outside of the wick. If you were 600 yards off the steamer meeting you, and if her lights were screened to 2° from the outside of the wick, have you any idea to what angle you would see her light at that distance, both lights?—The lights would converge within 600 yards if screened 2°. Taking a ship 50 feet beam, the lights would converge 700 feet from the two lights with the 2° angle.

1439. That was not quite my point. Supposing you have a steamer on the starboard bow, to starboard of right ahead, and you are meeting that ship steering a parallel course, and her lights are screened to 2° from the outside of the wick; have you any idea up to what angle you would see her red light?—Well, I would see the green light from right ahead to 2° on the port bow; if the vessel was 600 yards distance I would get reduced rays of the light 2° on the port bow, and the full rays of the light right ahead.

1440. You are looking at the other ship's green light, when that ship was a mile ahead, or two miles ahead, would you see both her lights?—Yes.

1441. Her red and green?—Yes, her red and green.

1442. As she approached you, suppose you both remain in that position, there would come a time when you would lose sight of her red light?—Yes, certainly, when she was very close to I should.

1443. Have you any idea at what angle, or rather what bearing in degrees from your fore and aft middle line, you would lose sight of that red light?—2°; I cannot give you further than that.

1444. You think you would lose sight of the red light when she made an angle of 2°?—Yes.

1445. As a matter of fact, with a powerful light you would not lose sight of that red light until she made an angle of 6°?—Well, I am afraid I do not understand. I should reckon you lose sight of it at 2°.

1446. Because you think at this distance the screening of 2° to the outer edge of the wick would cut off all the rays of the light at that angle?—What I say is this, if you screen your light so that the outer edge of the wick makes an angle of 2° with the foremost end of the screen, you are bound to see the full rays of that light right ahead, and the reduced rays on the other bow.

1447. You said that when you were meeting a ship port to port and red to red and you saw all her three lights, and were going clear, and you were sufficiently on her port side to go clear of her, that you would port still more; why would you port still more?—To increase the distance between the two vessels.

1448. Why?—Well, for safety.

1449. But that suggests you were not going safely before?—What I said was, if I made myself understood, that if a vessel was approaching me with her three lights, at any distance, I considered it my duty to port a little more, and bring her a little more on the port bow. Of course, if she were four points on my port bow I would not, but if she was only 4° on my port bow, I most certainly would port another 2° or 3°.

1450. I understood you to say you were passing clear?—No, I mean when they were end on; I was treating it that they were end on, when, as a matter of fact, they were not. That is our trouble.

1451. I thought your trouble was, that a ship could be passing clear of you on her port side showing both her lights?—Yes.

1452. And you said, if that was the case you would port still more?—Certainly, I would port still more, because I would not know whether the ship was end on or not.

1453. That appears to me as if you thought before that there was a risk of collision, or else why should

*Mr. W. H. Colquitt.*

May 1895.

you port still more?—There is always a risk of collision when vessels are approaching each other with all three lights in sight.

1454. Screened to 4°?—Yes, certainly.

1455. Therefore the ships would not be passing clear of each other?—In fact, they are passing clear of each other, but they appear not to be.

1456. You mentioned that when steaming against a six-knot current you port a quarter of a point, and the effect is the same as if you ported a point; what do you mean by that?—I meant that if you catch the tide on either bow, it forges you right ahead and across the Channel.

1457. But this is the case of two ships meeting, both ships are in the same current, and both are affected by the same current?—They are both affected by the same current, but they are going in opposite directions, and one has got the current on the stern, and the other on her bow, and that makes all the difference.

1458. That makes a great difference?—Very great difference.

1459. Theoretically or practically?—Practical difference. It is a matter of every-day experience. There is no doubt about it. In fact, I may tell you, if it is hazy weather, and we are running up to the Rock lights, and we are not quite sure of the ship's compass, we would sooner it be on the flood than on the ebb. A quarter of a point on the bow in such circumstances is a great deal of importance, because you would be ashore before you got half way up under those circumstances.

1460. I quite agree that where you have a fixed point like the shore it does make a great difference; but if you were out of sight of land, the current might be running 100 miles an hour, and if you ported to a meeting ship, you would pass her at a distance due to the angle to which you ported; nothing else would happen?—Of course, there is no practical difficulty in wide waters.

1461. It makes no difference with regard to wide waters, you say?—No; it is only where a ship is proceeding against the tide in narrow waters. That ship must not divert from her course more than is possible.

1462. If I am meeting a ship and if I port a quarter of a point, I shall pass her at a distance on my port side due to my change of course?—No, I am afraid I should pass you too near.

1463. Why?—Because you would have the current on your port bow.

1464. That is, I know, an expression generally used by seamen?—There is no doubt about it. If you are proceeding against a current and you catch it on one bow or the other, say half a point, it will make a point or a point and a half difference in your course; it is a fact, and there is not the slightest doubt about it.

1465. Of course when you are steering the ship up the river against the tide you naturally give her very small helm?—For that very reason.

1466. That is, having regard to the land?—Yes.

1467. You have heard the expression "green to green"?—Yes.

1468. Tell me what you understand by "green to green." Ships passing each other?—Starboard side to starboard side.

1469. If the green light of one ship is right ahead of the green light of the other, would you call that green to green?—If the green light of one ship is right ahead of the green light of the other. Well, when I have a vessel right ahead of me and pointing in an opposite direction, I expect to see the three lights.

1470. I am giving you the case when the green light of one ship is right ahead of the green light of the other?—Do you mean exactly; absolutely right ahead.

1471. Right ahead?—I cannot suppose that case if I understand you correctly.

1472. I now take this case (*describing*). *There* is one green light, and *there* is the other green light. I am looking parallel to the line of the keel and see approaching *this* green light right ahead of *my* green light. Would you call that green to green. You would not call that passing green to green, would you?—It is passing green to green, and it is the duty of any practical man to starboard a little more.

1473. You would not call that passing?—I should call that passing.

1474. *That* I would call passing (*describing*)?—Yes, and you would starboard a little more.

1475. That would be green to green?—Yes.

1476. And in that case those two green lights will make an angle with each other?—Yes; but I never heard of two vessels colliding in that way, each with the other's starboard side open. I can almost fancy it is an impossibility.

1477. Still, you admit it was a case of green to green?—Then you must get out of it. It is *there*.

1478. You spoke of meeting ships passing starboard to starboard. What part of the river would that be in?—That is between Port Lynas and the North-West Lightship in the open sea.

1479. Now, about the question of "right ahead" what do you understand by the direction "right ahead"?—Right ahead? I mean right in a line with the ship's keel, projected ahead.

1480. Parallel to the ship's keel?—Yes.

1481. That is, if you are standing on the starboard side of the bridge, and looking ahead in a line parallel with the ship's keel, if you saw a green light you would say it was right ahead?—If I got a light amidships, if I saw it was in a line with the foremast, I would say it was right ahead. As a matter of fact, if you want the exact bearing, you must get right amidships. If you get at the side of the ship it is likely to prove deceptive. If you want to get a bearing or to know the exact position of the light you must stand right in the centre of the ship.

1482. Supposing you have a buoy not very far off, and are in a ship with a large beam, would you not to clear that buoy walk the same side of the ship on which the buoy is?—Certainly, because that is the side nearest danger.

1483. Would you not look ahead in a line parallel with the keel to see if you could clear that buoy?—Of course you would look along that line to the buoy and clear it.

1484. And if the buoy came on that line, would you not consider it right ahead?—No, sir, it is not right ahead.

1485. With regard to the question of the right and the wrong side of the river, the rule of the road says you must be on your side of the river when it is practical to do so and safe. Supposing from any cause you happen to be on the wrong side of the river or channel, that would not exonerate you from having to follow the rule of the road?—No, certainly not.

1486. In fact, pilots have always to go by the rule of the road?—We could not conduct the navigation of the port unless we carried out the rule of the road in its entirety.

1487. (*Captain Hallett.*) You advocate screening from the outer edge of the wick for all lights?—Yes.

1488. Is that because of the different way in which wicks are placed; sometimes athwart-ships and sometimes fore and aft?—Yes, and sometimes circular.

1489. Is that your reason?—That is one of my reasons.

1490. So that your screening shall be such as to shut off all rays of that wick in whatever way it is placed, whether fore and aft, or athwart-ships?—Yes.

1491. Or at an angle?—Yes.

1492. That is the reason you want it cut off from the outer edge?—From the outer edge. I think it is a great deal better if you take it from the outer edge.

1493. Then, if the wick is placed athwart-ships, and you screen 2°, you know you get your full light ahead?—Yes.

1494. You do practically?—Yes.

1495. Have you had any experience of electric lights?—No, none whatever. Of course I have seen them on board ships.

1496. And you have met them?—Of course I have seen them at sea.

1497. Do you know if there is any greater convergence from electric lights, practically?—No, practically I have never noticed any difference between them and the oil lamps.

1498. (*Captain Castle.*) You were speaking of the number of collisions in the river; are not the bulk of them with small vessels?—Yes, they are.

1499. Those—I do not know what you call them?—Grabbers we call them, small vessels, the bulk of them are, that get in the way.

1500. They are very often getting in the way of steamers?—Yes, the fact of the matter is they hold no certificate and you do not know who is in charge; they have no pilots, they do not care for anybody, they do not care for rules or regulations—they have nothing to lose, whatever happens, for they are carrying cargo, and the Board of Trade does not insist on their holding a master's certificate or a mate's certificate, or anything; you might have a navvy directing them.

1501. You say it is a common thing for vessels shewing their green light a little on the bow to port and come across?—It is a very common thing.

1502. I am not speaking of the river, but down towards Port Lynas; it is no uncommon thing for ships being a point on your starboard bow still porting and sometimes more than that?—Not a point—I would not like to say that, half a point very likely; but, of course, if you are a point on the starboard bow, there would be no cause for a man doing that, no cause whatever.

1503. The screening of the lights would have nothing whatever to do with that?—No.

1504. I have seen instances myself where a ship has been 3 points on the starboard side?—That is one of the things you see but you cannot account for them.

1505. With reference to going up the river, is it not much safer to go up on an ebb tide than the flood?—Yes.

1506. You are speaking of the tide catching the bow?—Yes.

1507. And the ship is much better handled?—Yes.

1508. With the tide against you?—Yes, the flood tide gets you on, and the ebb tide keeps you right away.

1509. That is one of the risks?—That is the main risk. There are rivers you are not allowed to go up on the flood tide.

1510. (*Mr. Bolam.*) You have a large number of sailing ships in the Mersey?—Yes, a large number.

1511. Is there any special rule of the Harbour Commission that these vessels should take a particular side of the channel?—There is a rule that each vessel shall navigate on the starboard side of the channel.

1512. Even sailing ships?—Yes.

1513. You said you were not aware that the side lights crossed the fore and aft line of the ship before 1892?—I did.

1514. Do you mean that you were not aware that the whole beams crossed, or that you were not aware that the outside beams crossed?—I was not aware that the full volume of the light crossed.

1515. But you were quite aware that the reduced beams did?—Yes, I was aware that the reduced beams did.

1516. When you were speaking about vessels coming up and going down the river and altering their helm and the tide catching the stem or the stern, you are alluding rather to the different force of the current in the centre of the stream and at the side?—No; whether you are in the centre or on the side the effect is the same; there is a slight difference, but not very appreciable.

1517. Because if the current is greater in the centre than it is a little on one side, when vessels alter their helm that would twist the stern of the one ship across the channel and tend to straighten the other ship in the line of the channel?—Certainly, it would have that tendency.

1518. How many miles from Liverpool do you, as a pilot, have charge of the vessel?—Sixty miles.

1519. Are you responsible for the navigation of that ship through all that 60 miles?—Yes.

1520. So that practically you not only want a rule of screening to assist in navigating vessels up the river [illegible], but you also want a rule of screening for your 60 miles of ocean navigation?—Just so. What I say is this, if you reduce the screening of the lights to the lowest possible minimum it will materially assist people in the narrow waters, while it will not handicap them in wide waters.

1521. When both vessels see both lights dead stem on, what is the best way of avoiding collision?—Port in accordance with the rules.

1522. Is it an advantage or a disadvantage to get a coloured light as promptly as possible, one light to one light?—Very important.

1523. What you want is to see the bearing change?—Yes.

1524. And for this would you require a large angle or a small angle?—A small angle.

1525. So if vessels come stem on, in your opinion as a practical man, as a pilot, small screening points to avoidance of collision?—Yes, it would be so with me.

1526. I should be glad if you could state roughly to what angle vessels yaw. Take a fine passenger steamer in fine weather, how fine can you steer her?—Take our fine Atlantic steamers, it would be a bad quartermaster who could not steer within a quarter of a point.

1527. And tramps?—Three quarters.

1528. Sailing ships going free?—Two.

1529. And sailing ships sharp braced up?—Well, half a point.

1530. (*Chairman.*) There is only one question I want to ask you, and that is in reference to vessels having a list?—Permanently?

1531. How would that affect screening?—It does affect the steering.

1532. You are speaking about the steering. I was speaking about the screening?—Well, I have never noticed if it ever had any perceptible effect, perhaps it might have, but I should not like to give you an answer to that, because I have not noticed.

1533. Can you give me any idea, practically, what sort of list different vessels get. You have to bring vessels into Liverpool. Have many of them a list?—Yes, some of the timber vessels have come in like *that* (*describing*) with an angle of 45°, and some grain vessels sometimes are listed a good deal, although they try every means to avoid it. But I should think 10° a very heavy list.

1534. If that has an effect on the screening that is an important matter to be considered?—It is an important matter to be considered, but I can really give you no opinion, because I have not looked it up and never thought of it till you suggested it.

1535. (*Rear-Admiral Andoe.*) What do you consider about the average which ordinary steamers, nine or ten knot vessels, will steer in moderate weather coming up the Channel?—An ordinary tramp. A great deal depends upon the discipline. Some masters are very particular and their officers are very particular, and others are just as careless. You go on board one vessel, and the master is very easy, and you go on board the same ship with a different master, and he will, perhaps, steer within a quarter of a point. It is not a question of the capability of the ship.

1536. I am speaking of the helmsman, I want to know what you find in practice these ships generally steer to in the channel?—If they keep within half a point I am quite satisfied.

1537. A quarter of a point either way?—No, half a point either way. I am quite satisfied if they keep within that; and a good helmsman will keep within that. Others will exceed that, and will steer right over, but they get a rap from the officer on the bridge; they must not exceed 3° or 4° either way.

1538–9. (*Mr. Bolam.*) You say the best man would only steer to 3° or 4°; that is more than a quarter of a point?—3°, I should think an officer in a liner would never think of grumbling at a quartermaster if he could keep her within 3°, and if he exceeded that he would admonish him.

1540–1. (*Rear-Admiral Andoe.*) Practically it requires the best helmsman to keep a ship within 2° or 3°?—Yes.

1542. (*Captain Thomson.*) You have said some ships steer to two points and some 3°; had you in your mind at the time, the alteration of the direction of the ship's head by the compass-card, or the real alteration of the ship's head by land—which do you mean?—No, by the compass.

1543. But you are aware that does not correctly show the corresponding alteration of the ship's head?—Yes; because the compass may be sluggish.

1544. The real direction of her head may alter, perhaps, 6°?—That is quite possible.

*Mr. W. H. Colquitt.*

8 May 1895.

1545. (*Rear-Admiral Andoe.*) I would like to ask you, taking one of the Thompson compass-cards which you have seen on Atlantic liners, is there any question that you can steer, as far as the card is concerned, correct to a degree or two; you have no hesitation in saying that?—No, the card is correct.

1546. What the card shows in moderate weather is correct; there is no swinging of the card?—No, but I can quite believe the ship's head swinging a degree or two and it not being indicated by the compass at all, because no matter how excellent the compass—even Sir William Thompson's compass—it cannot follow the ship's head immediately.

1547. Therefore, if anything, the indication of the compass-card is really less than the swinging of the ship?—It cannot be more, it may be less.

*Mr. J. T. Posgate.*

Mr. JAMES T. POSGATE called and examined.

1548. (*Chairman.*) I think you are one of the Trinity House pilots?—Yes.

1549. How long have you been a licensed pilot?—About 23 years.

1550. Do you act generally as pilot, or do you act for one particular line?—I am engaged by the Orient Company as their pilot. I have been so for about 12 or 13 years.

1551. What is the range of your pilotage; how far do you take vessels down the Channel?—I am licensed to the Isle of Wight, in the English Channel, and to Orfordness in the North Channel, the limits for which pilots are licensed under the Corporation of the Trinity House.

1552. Have you come here to represent your own views or the views of the body of pilots as well as your own?—Well, not only my own; I think I can safely say I represent the pilots also; that is, the Thames pilots.

1553. I daresay you are aware there has been a memorandum* from the Trinity House pilots of the port of London, protesting against the rule of the Board of Trade, and that is signed by a very large number of pilots?—Yes, sir.

1554. Amongst others, I see your name as one of the signatories?—Yes.

1555. I may take it the views of these gentlemen are substantially the same as your views on this point?—Yes.

1556. I do not know if you can give me off-hand about the number of the pilots in the port of London?—About 300 altogether, I should say; but then that is including what we call the exempt men in the river.

1557. But fully licensed Trinity House pilots; how many are there about; about 120, is it not?—What, for the sea?

1558. Yes?—Yes, for the sea. More than that, about 140.

1559. I observe that this is signed by 117 of the Trinity House pilots?—Yes.

1560. So there is something like unanimity in the views of the pilots on this subject?—Yes, there is.

1561. Now, what is your view as to the manner in which lights should be screened?—Well, I think that the lights should be screened as nearly as possible right ahead of the ship.

1562. Yes?—From right ahead to two points abaft the beam, as the Act says.

1563. Then, as to the crossing of the lights, I daresay you recognise that if the lights are exhibited so as to show their full light ahead, it is necessary there should be some crossing?—Yes.

1564. Of some of the rays?—Yes.

1565. Now, what is your view about that crossing?—Well, I think that if they could be screened—if it were possible to screen the lights so as to cross about one mile ahead of the ship—I am speaking now of one of the large mail boats, of 50 feet beam.

1566. One mile ahead?—That would be a very small angle. Certainly inside one degree.

1567. Do you mean one degree measured from the outer edge of the wick, or from the inner edge?—From the outer edge of the wick.

1568. There is a difference?—Yes.

1569. You have said from the outer edge of the wick. Do you think that is as convenient a mode of screening—I mean apart from the number of degrees, and merely as a mode of screening—do you think the measuring from the outside of the wick is as convenient as any other method?—I think so. The Trinity House Corporation went into it at one time. They rather leant towards screening from the middle of the wick, but there is very little difference between the two—a very slight difference.

1570. So that you are satisfied with the screening from the outer edge of the wick?—Showing you inside one degree.

1571. (*Mr. Bolam.*) Does the witness's expression "small difference" refer to the angle of screening, or to the most convenient method of screening?

1572. (*Chairman.*) I was asking the witness as to the method of screening, apart from the angle employed. I mean an angle of 2° from the outer edge of the wick would, of course, be a different angle from 2° from the inner edge of the wick. I was not alluding to the angle, but the point from which the screening should work?—Yes.

1573. And I understand that from this point of view it is as convenient to work from the outer edge of the wick as the inner?—Yes.

1574. Now I want you to be kind enough to give us your views. Why you think the screening should be as fine as you suggest; why should it not be 4°?—Because if you have it 4° a ship that is passing on your starboard or port bow—for instance a ship on your starboard bow would see your port light, and of course the one on the port bow—what we term fine on the port bow—would see your starboard light; he is not right ahead.

1575. You attach importance to the lights being screened as fine as possible?—As fine as possible.

1576. Do you think that applies equally to open water and to narrow channels, and that it is as important in the one as the other?—Much more important with narrow channels. If you only have two side-lights to deal with in the open sea, a 4° angle would be a safe one. Where you have only two ships to deal with, of course, it would make you get out of each other's road more. But in narrow waters you cannot have that degree.

1577. Of course, in the Thames you have experienced a great deal of work in narrow waters?—Yes.

1578. And it is speaking from that experience that you think the screening ought to be so fine?—As fine as possible; so that the lights are seen ahead at a fair distance. For instance, in Sea Reach, you might be going down with a steamer—you might be between the Mucking Light and the Nore Light and meeting three steamers, and you can put each of the steamers where you like and they would show you all three lights; with the steamer on your starboard bow you would see all three lights, and with the one on the port bow you would see all three lights; and with the one ahead of course you would see all three lights.

1579. Whereas, if the screening were fine, you would have two distinct?—Yes; and the least alteration made in the ship's helm would be indicated at once with a fine screening.

1580. You do, as I understand, attach importance to the full light of each light being seen right ahead?—Yes, right ahead. But I do not see the importance of having them seen right ahead close under the bow.

1581. That leads me to ask you what your view is about what is called the dark lane and the danger of it. What do you think about that?—I never experienced a dark lane. I do not say there is not a dark lane, but when you get into that dark lane you will be too close to a ship to do anything. That is with the screening of the lights ahead, because these powerful lights they have now show a different light altogether to what there was when the law was made, and when these side lights were first instituted. You have got to deal now with powerful oil lamps—mineral oil—and you have to deal with electric lights, too; and it is no uncommon thing now to see a steamer's lights five miles away from you on a clear night—electric light.

* *See* Appendix 6, No. 2.

1582. Now, before this rule as to the 4° screening came in, are you at all aware what the angle of screening in the vessels in the port of London was?—No, I am not. Speaking for myself and the pilots, we were under the impression that the lights were screened according as the Act was worded. The construction we put on it was that it was from right ahead to two points abaft the beam. I have seen vessels with their lights crossing before this came forward, this 4° screening. I have seen them.

1583. But your practical belief, on which you acted, was that the vessels were screened fine?—Fine.

1584. And that the lights did not show to any extent across the bows of the vessel?—No.

1585. I should like to have your views on this, for it is a matter to which the Board of Trade attaches great importance. You know the view taken by the authorities of the Board of Trade is that it is important to have a screening not quite so fine, in order to give the fullest effect to the rule or rhyme "green to green, "red to red, perfect safety, go ahead." I do not know whether you have followed the argument which is put forward on that point?—No, I have not.

1586. Just let me put it to you. The suggestion which is made is this: that supposing they are screened very fine, say, one degree, and you had two vessels approaching so that each would see the green light, and only the green light, of the other, and supposing they were advancing on parallel courses, then that would be, if they kept their courses strictly, a position of danger, although it would be a position in which they would be green to green (*describing with the models*). What do you say as to that?—I think that is too fine. We consider that, practically speaking, they are right ahead, the way you have placed them now.

1587. They are showing green to green, I mean them to be green to green, so that if they kept end on there would be a collision?—Yes. But you have not put the beam of the ship between them, there is not a beam.

1588. I am putting them so that they would be green to green, and at the same time so that there would be a danger of the ships or their yard-arms coming into collision?—Yes.

1588*a*. What is suggested is, that under those circumstances that is a position of danger, that is to say, there would be a collision if they kept their courses, and yet, owing to the extreme fineness of the screening, all that would be seen would be the green of each vessel. Now, practically, do you think that is a position of danger?—No, I do not think so.

1589. Supposing you were on one of those vessels?—Yes, and neither of us could see a red light.

1590. Yes, and neither of you could see a red light, what would you do?—Starboard, certainly.

1591–3. Supposing you saw the green as fine on your starboard bow as I placed it, then you would give a touch to the helm?—Yes, because you see the red light is not seen. I certainly should starboard so long as I could not see his red light.

1594. So that you do not say that is a strong reason in favour of the lights crossing at a greater angle in order to avoid that position of what is called danger?—The moment you get them so fine ahead, you know these ships are always sheering a little or deviating from their courses slightly to a matter of 2°.

1595. Exactly. Now, as a matter of steering, within what degree does a vessel usually steer?—Take a mail steamer, and she will steer within a couple of degrees easy enough in fine weather.

1596. That is very good steering, is not it?—That is very good steering, a couple of degrees each way.

1597. Generally the average is something rather more than that?—Yes, and I am very sorry to say that the modern vessels are getting worse.

1598. They do not steer quite so close?—No.

1599. Why is that?—Oh, because they are not built to steer.

1600. (*Mr. T. Sexton.*) They are built to carry?—Yes, built to carry, you cannot steer them.

1601–2. (*Rear-Admiral Andoe.*) Talking about steering, what is the average as far as you know, which the ordinary ocean tramp would steer in moderate weather in the channel?—Well, I tell you it is no uncommon thing to see them go a point and a half each way, and two points each way.

1603. Notwithstanding that we are considering the desirability of screening to a degree?—Yes, screening to a degree.

1604–6. In navigating the narrow channels of the Thames, for instance, the Ouse channel, or the Edinburgh channel, and still more so in the case of narrower channels like the Girdler channel, what is your rule as regards steamers passing each other in opposite directions—which side do you keep?—Well, we passthem on our port side in those channels.

1607. You keep on the starboard side of the channel?—On the starboard side of the channel; but if a man was well on my starboard bow, I should not certainly port to go over to him, I would let him pass that side if he elected to go that side.

1608. But, as a rule, pilots are supposed to keep on their proper side of the channel?—As a rule, but in Sea Reach you cannot do that. You cannot do that in Sea Reach at all times of the tide on account of the shoal water.

1609. But if you found yourself on the wrong side of the channel, would you cross the bows of the other vessel to get on your right side?—No, you cannot do it in Sea Reach. If you go down Sea Reach with a deep boat—if you are coming up you could keep right—but one coming down has to keep northward of mid-channel to pick the water.

1610. Therefore you cannot comply with the rules of the road in narrow waters?—No, and I cannot comply with the Thames Conservancy rules, not wholly or fully.

1611. If you see a steamer approaching you showing both his side lights, and you were as far over on your side as you think is safe, what action would you take?—I should not take any action at all.

1612. Leave her to get out of your way?—Yes, if you put me into a position that I could not port any more, I would not be justified in putting my ship ashore.

1613. You would not be justified in putting your ship ashore?—No, and you would expect him to follow the rule of the road and port a bit.

1614. Therefore you are guided in the narrow channels by the local regulations rather than by the rule of the road at sea?—Yes, but they both apply there.

1615. You cannot port your helm?—No, but he can port to come up.

1616. He can?—Yes.

1617. But you cannot?—And it is a rule of the road for him to do so.

1618. Do many collisions take place between steamers at night in the narrow waters of the Thames—the entrance to the Thames when they are in charge of pilots?—No, not many; not many in comparison with the traffic; there is enormous traffic.

1619. But in comparison with the collisions that take place round the coast of England?—No.

1620. Less in proportion?—Less in proportion.

1621. Does not this fact show that having pilots on board following their local regulations prevents the collisions rather than the side lights?—It does, to a certain extent; yes.

1622. And is not this also the case because the pilots understand one another and what each other's actions will be in the different parts of the river?—Yes, it is so, and what you are continually seeing vessels doing, if you meet them in the same position. For instance, I have been going down Sea Reach on the bridge of a steamer at night since these lights have been screened at the 4° angle; a steamer was going up on my port bow, and the captain has said "That vessel is coming on," and I said, "No, it is the screening "of the side lights, it is all right." He said, "You "can see she is coming right on you." I said, "No, "she will be all right," and she passes all right. If the captain had had charge he would be doing something that was not necessary, only it was my knowledge, and I knew what the other pilot would do.

1623. Therefore pilots trust one another to do the right thing?—The right thing, yes.

*Mr. J. T. Pesgate.*

8 May 1895.

1624. And they are not guided so much by the different lights as they would be at sea. Is that the case?—Yes.

1625. And supposing you see a vessel not acting as you think she ought in passing you, is it not the custom amongst the pilots to call attention to one another by the steam whistle?—Yes, if we see he is going into danger in any way we do that.

1626. Are you of opinion that for the safe navigation of steamers generally it is desirable that the side lights should show as strongly right ahead as at any other point?—Well, I do not know it is quite as desirable they should see the full power right ahead, because if you have the masthead light you know there is a a vessel of some kind or other. I know there is some danger then. I do not think it applies to them with equal force as it does to a sailing ship, because with a steamer you have got, in addition to the two side lights, the masthead light. There is a light there, and it tells you there is a vessel of some kind there, and you can form your own opinion, generally speaking, that it is a steamer's masthead light, although you may not see his side lights.

1627. Are you of opinion that it is not as necessary to see the side lights of a vessel with the same brilliancy directly ahead of a vessel as, say, at four point on the bow?—I do not think it is as necessary perhaps with a steamer, inasmuch as you have got the masthead light, but it seems to me necessary it should be so with a sailing ship, because a sailing ship is only dependent on her side lights for safety.

1628. You do not depend on the masthead light to show the direction in which a vessel in steering?—No, but you know as a fact there is something there, and you must not run over it; you must be on your guard.

1629. But in thick weather you want to see how you are steering coming up channel?—At once; you want to know what to do.

1630. And supposing you are between one point on the bow and right ahead, then the two lights are dimmed somewhat?—Yes.

1631. You cannot see them as well as you could if you were approaching the vessel at four points?—No.

1632. Do you think that is desirable, considering it is a point of danger?—Well, I do not know that it is desirable exactly, but still it does not seem to me to apply to a steamer so forcibly as it does to a sailing ship.

1633. No, I did not say that. I refer to a steamer?—Because there is a masthead light. You have got to port; you need not run over it; there is a light of some sort.

1634. Before the 4° regulation came out were you aware that the rays of the side lights always did cross?—No, not before; I have heard so since, because of the tables that the Board of Trade issued, showing the difference in the angles of screening, but, as I told the Chairman just now, we were previous to that under the impression that the side lights were screened according to the interpretation we put on the Act, viz., from right ahead to two points abaft the beam, and we were not aware they crossed the bows to any extent.

1635. You were not aware that a very large proportion of the ships sailing from the English ports had their lights screened four degrees?—Not then, but we are now.

1636. You were not aware then?—No, that is what I say; we have only found that out since the discussion came on about the side lights, and through the Board of Trade publishing the tables.

1637. If the screening took place so that the line drawn from the inner edge of the wick to the outer edge of the chock on the screen were parallel to the keel, so that the full force of light might be thrown right ahead as well as anywhere else on the bow; are you aware that the rays of the light would cross at a comparatively short distance?—I am aware of that, yes; that is why I advocate screening from the outer edge of the wick, and then you have to consider that the flame is wider than the wick.

1638. If you were to screen as you propose, 1° from the outer edge of the wick, do you know that much of the light would be cut off from being seen right ahead?—Well, how far ahead, sir?

1639. Anywhere ahead?—Well, I beg your pardon, sir. If you are a mile away from one of these big ships at night, her two side lights look no further apart than those lights (*pointing.*)

1640. But the chock would actually cut off a large portion of the rays from going beyond at all?—It might, but somehow you look right down those screens. With those short screens you cannot screen the light so far ahead as that to a mile.

1641. You cannot what?—You cannot hide the light that way.

1642. No, but you spoil the light?—You might spoil it a little, perhaps.

1643. Now supposing it were proved beyond doubt that the average screening had been 4° or more before this new regulation came out, do you consider that any alteration should be made, or that they should go on as formerly?—No, I consider it should be made.

1644. Alteration should be made?—Alteration should be made.

1645. In what direction?—As I say.

1646. Towards reducing the angle?—Yes, to screening the lights as fine as it is possible to screen them.

1647. Although it might be a distinct alteration from what had been the former custom?—Yes, but there has been no uniform custom hitherto. They have been all at different angles.

1648. You said just now that so far as your experience goes there is practically no dark lane?—No, practically no dark lane.

1649. That proves, of course, that the rays of the light must have always crossed?—Yes.

1650. And that rather near to the bow of the ship?—Yes, you may say that. I never found a dark lane yet, but I do not deny there is a dark lane if you get near enough to the ship; but you are then too close to do anything.

1651. (*Captain Thomson.*) You have practical charge of ships, I believe, right down the channel, have you not?—I am licensed to the Isle of Wight.

1652. But you have experience of avoiding collisions in the channel generally?—Yes, certainly.

1653. In the case of meeting a vessel is your practice the same in the channel as it is in the river?—No, not exactly.

1654. What is the difference?—Well, you are bound to pass vessels very close, green to green, in the river, very close; for instance, if you are in any of the channels where there is not much room and a man coming up or going down, as the case may be, passed on the starboard side, you are bound to pass close to him.

1655. In the river it is a necessity; you cannot avoid it?—It is a necessity in the river, you have not the room.

1656. You have not the room you have in the sea? No. Then you would not run the risk. I mean you would not be justified to go past the steamer within almost touching distance, so to speak—hailing distance.

1657. Now, you advocate a screening of 1° from the outer edge of the wick?—No, I do not advocate screening to any degree; I say the lights should be screened as fine as possible. I would not object to a 1° angle.

1658. As near as possible?—As near as possible right ahead.

1659. Then, if the lights are so screened as near as possible right ahead?—As I said, the lights should converge in a steamer of 50 feet beam about a mile ahead of the ship.

1660. In the river, if the lights are screened as nearly as possible right ahead, you would see the green light, and he would see your green light, and you would keep on a port course, passing close to him?—Yes.

1661. But you might pass very close?—You might pass very close.

1662. And in the river or in the channels you do not consider that a foolhardy thing to do, because it is a necessity?—Yes. You are passing vessels within your length in the river, but at sea you consider a vessel very close to you when it is so near as that.

1663. Now at sea you might pass a ship under those conditions, if you did not alter your course, green to

green at a distance, say, of 20 feet?—Oh no, I do not think so.

1664. You would not consider that safe?—No, I do not think you would pass her within 20 feet. You would be able to form a better opinion of the ship's distance from you.

1665. I mean if you did not alter your course under the same conditions?—Yes.

1666. But that would not be safe?—No, it would not be safe.

1667. If, on the other hand, you had a larger angle of screening, you could not possibly pass a ship so close, green to green?—Not at sea.

1668. But in the river you could do it?—You could do it, but then it is sometimes the fact that if he was so close on your bow as that you would see his port light, and you would be altering your course.

1669. Seeing his port light?—Yes, if you put her so fine as that, you put him in a position to pass more than 20 feet at sea. In Sea Reach in that position to pass at 20 feet I should see his port light.

1670. With your fine screening?—No, with the 4° angle you are talking about.

1671. In the river you would see his port light?—Yes.

1671*a*. Yes, but still, if the channel was narrow, you could not afford to port; would you consider it would be safe to pass him, starboard to starboard, seeing his three lights?—I do not know; that would depend on circumstances.

1672. I understood you to say just now you did. When your draught of water did not admit of porting, you did pass like that?—Yes, I did.

1673. Therefore, in the river, you at times do so?—Yes.

1674. But it is contrary to the rules of the road?—Well, it is contrary to the rules of the road. When you put it so fine as that, a man going only 20 feet off my line of course, I should assume he was as near as possible right ahead at one time—when we first sighted him.

1675. Is it not, perhaps, the most difficult part of your work, drawing the line between keeping your proper depth of water, and altering your course as it may be necessary to avoid collision going through the channels?—Yes, there is the difficulty.

1676. And as long as that difficulty exists, you would never be able to say precisely whether you could obey the rule of the road or not; it is left to your judgment?—Yes, of course, it is left to your judgment. I was only following you out as to what you said about applying the rule of the road, but I said previously, you cannot possibly carry the rule of the road out always.

1677. But you always would if you could?—Yes, if you could.

1678. You mention a case in which you had two ships going down the river, or going up, showing all three lights on your starboard bow?—I said in Sea Reach it is no uncommon thing to see three vessels approaching you and all three showing both side lights with the present system of screening 4° inboard.

1679. What would your practice be in that case?—Well, that just depends upon the ship I was on board of.

1680. If the depths of water admitted, would you not port to both those vessels?—I might do it or I might not.

1681. You might not?—No, I might not.

1682. Even if you had water and room to do so?—Well, there might be other vessels that prevented me porting on our starboard bow.

1683. That leads to another question. Does not the rule of the road apply to two vessels only?—Well, if you put me at sea I should say yes, we would port.

1684. You would?—Yes.

1685. You would on the river if you had room?—There might be other vessels. There might be room but I am speaking of two vessels if there were other vessels about.

1686. But at sea you might have other vessels about?—Well, hardly, you could not assume that.

1687. Your own judgment has to be exercised with discretion?—Yes, of course it has.

1688. Do you not consider that this Article 15 of the Rule of the Road means that when two vessels are meeting each other end on or nearly end on, so as to involve risk of collision, they are both to alter course to starboard so as to pass port to port?—Yes, port to port.

1689. Do you not think that applies more or less, in spirit at all events, to all these schedules or sub-articles, whatever they are?—Yes. Well it does.

1690. That is the spirit of the rule of the road, that two vessels meeting end on should alter their course to starboard?—Yes; "end on, or nearly end on," that is how it is worded.

1691. You told us just now that if you saw a green light practically ahead of you at night you would starboard?—If I did not see his port light I should, because there would be nothing to indicate to me but what he was crossing me, although it would not be my duty to do it; sometimes we have to do it to avoid collision.

1692. Is it not a fact that from the point of view of pilots you generally meet ships—you do not often cross ships in the channel?—No, we are not crossing the ships.

1693. You do not look at the matter so much in that light?—We find we are crossing ships sometimes when they are going out on the Foreland.

1694. As you say, when you saw that green light, that ship might be standing at right angles to you?—Yes, of course it might.

1695. Then why should you starboard?—If he is on my starboard side?

1696. Yes, why should you starboard?—I have to keep clear of him if he is on my starboard side, and by starboarding a little it would ensure more safety.

1697. It would be very awkward if you were going down a river and had many ships crossing you, if you had to starboard for every green light you saw ahead?—Of course it would.

1698. Therefore, in many cases, you would not starboard?—No.

1699. Therefore, if a ship, showing a starboard light, came right on to you there might be great risk of a collision?—But I am not going to let him do that exactly.

1700. (*Captain Hallett.*) You could tell by the alteration of the bearing of that green light if she is coming straight at you or crossing your bow?—If she was coming fine——

1701. If she was crossing your bow you would know it from the alteration of bearing?—Yes, if she was crossing at right angles you would probably have seen it before she was crossing.

1702. Is it not the case that in the river and in these narrow channels from your accurate knowledge of the banks and the draught of the ship you can judge where the ship is going to pass you?—Yes.

1703. You can form a judgment there that you cannot form at sea?—Of course.

1704. So that the practice in the river is much more dependent upon your personal judgment than upon the actual position of the lights that you see?—Yes.

1705. Or the rule of the road?—Or the rule of the road.

1706. (*Captain Wilson Barker.*) Do you think the 2° would be rather fine for sea work?—I think it would be too much.

1707. Too much for sea work?—Well, I think 1° would be better.

1708. One degree quite sufficient?—Yes.

1709. For sea work?—Yes. I will tell you what happened to my brother, who is a pilot, going down in one of the New Zealand boats, to show you this 4° angle and the objection to it, and how it very nearly resulted in a collision. The New Zealand steamer, which we will call A, is proceeding down channel between Dungeness and the Royal Sovereign light, steering west, and is meeting B proceeding up channel on a parallel course about one point on A's starboard bow. A intends passing B on the starboard side, when A sights another steamer C right ahead showing both side lights.

*Mr. J. T. Posgate.*

8 May 1895.

A ports half a point so as to pass C on port side, still keeping B on starboard bow; but A's side lights being screened to an angle of 4° inboard, A after porting the half point opens her port light to B, who at once ports. A has to hard-a-port and just avoids colliding with B. C has also to hard-a-port to avoid colliding with B, and B, to avoid A, crosses C's course.

1710. What disadvantage do you see in that position?—I think, if the lights had been screened fine they would have passed in between each other, very nicely—there is no doubt about it. Six weeks ago I was with the "Ormuz," and we stopped 26 hours in the Downs in a fog. The day previous had also been thick in the Channel, and on the fog clearing we proceeded and passed that night some 100 steamers between the Downs and Beachy Head. I merely mention this by way of illustrating the importance of having the side lights for the purpose of safe navigation screened to a fine angle in crowded waters.

1711. The question is whether he can be trusted altogether to work his ship in that way you are discussing?—Of course, that is the difficulty.

1712. (*Chairman.*) What I gather you desire to do is to make it as clear as possible from what he does whether he is experienced or whether he is not?—Yes.

1713. (*Rear-Admiral Andoe.*) I think the people we have least to consider are the pilots, because they are always at it, and they know what one another will do. They see a big ship is coming along and know he has got a pilot on board, and each knows exactly what the other will do?—Yes.

1714–5. What would you do when the vessel yawed, that is to say, if he did not steer well, and you saw sometimes one light and sometimes the other?—There is nothing else for you to do but to port.

1716. In passing that is what they do?—Yes, but you must not forget that all that time the man is coming on.

1717. (*Captain Barker.*) No doubt that is a puzzling situation to be in, but we have to consider that there may not always be experienced pilots, and you have to provide for the weakest link in the chain?—Yes, that is so; that is why I suggest this.

1718. Do you not think many collisions happen through each man thinking the other man is going to do something different from what he does?—Yes.

1719. Each thinks the other is going to get out of his way?—Yes, and officers will not give way in time. And the consequence is that very often difficulties arise and danger ensues.

1720. What do you think as to the position of the lights with regard to one another; what do you think of the vertical plan?—No, that is wrong.

1721. You think they ought not to be in a vertical line?—On the bridge is the best position, as the ships are reckoned, but there is a better position than that, but you cannot carry it out. You have got it *there* [*describing*] putting the masthead light *there*, and the side lights *here*, and the masthead light being a distance above the deck equal to the beam of the ship. Then you get these two lights crossing either way. He is coming to you *there*, and you have got the masthead light over the port light, and you know he is going all right, because there is an angle of about 45° there; if he ports a little, and brings you open to his port light, you know he is coming towards you, and in this case you know what he is going to do. You know he is going farther away from you, but *that* is the best position [*describing*] but you cannot carry them in that position, because, when you get on a vessel like that, 40 feet forward, you get in the narrow part of the ship. But *that* is about the best position.

1722. (*Captain Castle.*) In a line with the masthead light?—No, forward of the masthead light. Put the masthead light there, and you get the two lights in one.

1723. (*Mr. Bolam.*) You would have them as much before the masthead light as the beam of the ship?—As much the width of the ship ahead of the masthead light.

1724. That would equal the distance of the line joining the side lights?—I do not believe in the vertical position but in the bridge position.

1725. Your district of pilotage is a compulsory one?—Yes.

1726. What vessels are compelled to carry pilots in your district?—All passenger steamers, all vessels carrying passengers, and all vessels that are bound to foreign ports, that is south of Brest, with cargo.

1727. That is, home trade cargo vessels are not compelled to have pilots?—No, but home trade passenger ships are.

1728. Then a great number of vessels must be going through your compulsory pilotage district not carrying pilots?—A great many.

1729. So that every vessel going up and down does not have the benefit of the assistance of an experienced pilot?—You see all the coasting vessels, do not carry a pilot, but there is no doubt that the captains from continually trading in and out of the port are equal to the pilots.

1730. Within your district a great number of the masters are, I believe, qualified to act as pilots?—Yes.

1731. So that practically a very large percentage of the vessels going through your pilotage district would not have special pilots on board in addition to the ordinary people of the ship?—Quite so.

1732. When you said you did not know before 1892 that lights crossed the bow, did you mean the full light or the diminishing light?—I meant the full light.

1733. You knew the diminished rays crossed the bow?—Yes.

1734. Do you say that in restricted navigation, practically river navigation, the narrow angle of screening is imperative for safety?—I do.

1735. Do you say that your difficulties as a pilot, with all your skill and care, are increased with a wide angle?—I do.

1736. Do you think that a small angle is practically as good in the open sea as a large angle?—I think so.

1737. Then, in point of fact, if that small angle is imperative in your navigation, and is equally good in open sea navigation, you would say that both for sea navigation and for your restricted navigation a small degree of angling across is the best thing?—One uniform screening, I think, is best both for river and sea.

1738. (*Mr. Scrutton.*) The dark lane does not trouble you?—No.

1739. I suppose the real reason is you never allow yourself to get so close?—Yes, probably.

1740. Have you any idea how many registered vessels come up to port day by day, every 24 hours?—No.

1741. Supposing I said there were 150, should you think it reasonable?—In 24 hours, in and out?

1742. Up?—I do not know that it would be 150 day by day.

1743. On the average. That is the average you may take it, 54,000 in a year; and of course they go down again. When these regulations were made in 1892 as to the 4° angle, did you notice any difference?—What, in the navigation of ships?

1744. In regard to the lights?—Yes, there is an element of uncertainty now existing, when you see a vessel on your starboard bow, whether he will continue to pass you there.

1745. How does that arise?—Vessels you are passing in the daytime, starboard to starboard, with confidence, at night time port to you, and we consider it is only the screening of the lights and their seeing the light across the bows causes them to alter their course.

1746–7. The evidence we have is that the lights were screened even to more than 4°?—Before 1892 we used to say, "He is on our starboard bow; he cannot "see my port light." But now we know the port light is screened 4° across the starboard bow. So that is constantly before us, and we think he can see the port light probably.

## Thursday, 9th May 1895.

PRESENT:

THE RIGHT HON. SIR FRANCIS H. JEUNE IN THE CHAIR.

Rear-Admiral ANDOE.
Captain WILSON BARKER.
Mr. BOLAM.
Captain CASTLE.
Sir FRANCIS EVANS.
Sir EDWARD HARLAND.
Captain HALLETT.
Mr. SCRUTTON.
Captain THOMSON.

Mr. C. HIPWOOD, *Secretary*.

Mr. THOMAS TASKES HOGG called and examined.

*Mr. T. T. Hogg.*

9 May 1895.

1748. (*Chairman.*) Mr. Hogg, I think you are one of the Trinity House pilots for the Port of London?—Yes.

1749. And you came here to express your opinion, and may I take it your opinion is shared by, at any rate, the great majority of the Trinity House pilots?—Just so.

1750. How long have you been a pilot?—Twenty years.

1751. Have you acted chiefly for one line of vessels?—The last 14 years for the British India Company.

1752. Acting for one company in that way do you confine yourself absolutely to that one, or do you do other work as well?—I have done other work, but you may take it I have confined myself for the last 13 or 14 years to the British India Company.

1753. Those are big vessels mostly?—They are all large vessels.

1754. What sort of tonnage?—Well, the largest one is 5,000 and some odd hundred tons registered tonnage, the Golconda going down to 2,000 and so on—not less.

1755. What is the variation of the breadth of the beams, and the distance between the lights of these vessels?—From 45 to 50 feet.

1756. What part of the Thames do they come up to? Do they come to Tilbury or to London?—They come up to the Albert Docks, but I only pilot them from Gravesend to the Isle of Wight.

1757. Before the present 4° rule, what is your view as to the angle of screening which practically was in force so far as your experience went? Do you think the vessels were screened finer than that or broader?—A great many were in line with the keel, and others were at various angles, and the only remark I ever passed was, that there was something the matter with the screens or that they were badly screened, as we saw the lights showing across the bows. That is previous to two years ago; but, of course, we take it for granted that what they ought to be, according to regulations, is in line with the keel.

1758. That is just what I wanted to know. Before the rule was in force, what is your belief, first of all as to what the state of things was?—My belief was that the screening of the side lights was in line with the keel, and all that we saw that were not in line with the keel we considered were defectively screened.

1759. So that before the rule was made, you did not think that the line of the lights crossed or ought to have crossed?—I thought that they ought not to have crossed.

1760. In some cases perhaps they did, but at any rate you considered it was wrong if they did?—Certainly.

1761. Now, I should like to know what your view is. Do you agree with this 4° rule?—I do not. I consider it ought to be in line with the keel; on the starboard side of the ship, that is, from right ahead to two points abaft the beam and nothing else, and on the port side of the ship the same way.

1762. Of course, you know if you have 4° there is a certain amount of crossing of the lights, the amount depending upon the breadth of the ship?—The breadth of the ship.

1763. Now, why do you consider it objectionable that there should be that crossing of the lights?—I have two special reasons. The first is that a short time ago I passed a large steamer in the English Channel, and her green light which was probably a blue-green—the best colour—I saw on my port bow crossing the other steamer's bow about two points. His red light was dim, and the result was that all that I saw was the mast-head and green light; but I saw that he was not starboarding, otherwise I would have had to stop. And as we drew nearer towards him, I could make out his red light very dim; in fact, nearly out, I suppose. Now, if that green light had not been crossing that steamer's bows I should not have looked for it. I should have looked for his red light, and when I saw it, I should have simply said that man had a bad side light. Now, reverse the position and place the other steamer on my starboard bow. There are two kinds of lights, what they call the yellow-green and the blue-green; the yellow-green light at a very short distance becomes a dirty white, and you cannot see it very far; the blue-green light is very good and you can see it at 3 or 4 miles. Now, imagine that you have a steamer on your starboard bow carrying one of these yellow-green lights and that her lights cross. You only see a mast-head light and a red light, and you suppose that he is porting his helm, whereas probably he is doing nothing of the sort. There is no doubt in my mind that the crossing of these lights has in great measure been the reason why a great deal of porting has been going on which is unnecessary. There is existing at the present time, and it is no use disputing the fact, a class of men who when they have your green light open to their green light will port; if asked the reason, they would say it was to see your red light. The crossing of the lights, the red light crossing the bow, would simply intensify that porting of the helm, and there is no doubt that this porting has been productive of a great many collisions in its time.

The second reason is one that I do not suppose people have paid very much attention to. The rays of the red and green lights cross the ship's bows; and there is no doubt in my mind, from what I have seen during these last number of years, that these rays of light affect the vision of the people on the bridge in a way which they are perfectly unconscious. Time after time you will hear the remark of the officers on the bridge with respect to sailing ships, "That man has just put his side light over." The red or green light has just penetrated the rays that go round the bows of the ship. Considering this effect of your own side-lights, it is my opinion that the best place for them is the sides of the bridge. You minimise their bad effect by being on the bridge in a line with them. Of course it is not fair between the look-out and ourselves, because we have night glasses and are constantly searching the horizon, and therefore we see what they do not, but take two men of equal powers of vision and let one man stand on the forecastle and you on the bridge, he below the rays of the light, and you above them, that man would see a light with his naked eye before you would with your naked eye. I contend, that the more the lights are crossed the greater is the effect on the vision. It is upon these grounds that I prefer that the lights should be in a line with the keel. You will never get over this blinding

*Mr. T. T. Hogg.*

9 May 1895.

effect of the side-lights; there it will be as long as ships are ships; but you can modify it, and for this purpose it it is preferable to have the lights in line with the keel.

1764. Of course you are aware that if the lights are to show the full 10 points—2 points abaft the beam and 8 points forward—they necessarily must, to some extent, cross, or, at any rate, the rays of them must cross?—The diffusion of rays, if we allow it to be 3°, would just give you what you want—the red light ahead; allow the diffusion of the light to be 3°, and I believe it is something like 3°, then, if the lights cut in a line with the keel with a diffusion of 3°, you would have just what you want; you would have the lights cutting right ahead of the ship, and the finer cut the better it is.

1765. As I understand your position, you do attach importance to the full light being seen ahead of the ship?—Yes, in a line, as I have described it.

1766. And I understand your view to be that, subject to the full power of the light being seen ahead of the ship, you would desire to minimise as much as possible the crossing of the lights?—That is my opinion.

1767. I do not know whether you have ever considered the exact angle at which it is desirable to screen. Have you ever considered whether 2° from the outer edge of the wick would give a satisfactory result?—We have had them from 2° I apprehend, and 1°, and right ahead; the nearer you can come to lowness that way the better. If I might take the liberty of showing you a sketch of the 4° which I have made out.

1768. Yes, certainly?—This (*producing a diagram*) is one of the ships I go down with; it is all to scale, I have worked it out. There is the trigonometry of it, if you wish. This ship is 450 feet long.

1769. This is all to scale?—Yes; there is the scale which it is done from. Now, this ship is 450 feet long from stem to stern, and from these two side lights, which are 50 feet apart, there is a distance of 150 feet to her stem. Therefore, it follows that *this* light from its outer edge of the wick, and *this* light from its outer edge of the wick, must cross at 207·5 feet ahead of the ship; that is what it works out to. Now at the distance of 1 mile, here is the red light, 425 feet broad, and the green light 425 feet broad. *That* is the plan of the light. Now, as I have already suggested, the diffusion of light is equal to 3° more; you then very nearly double this distance in the sea mile. This is cutting as though there were no diffusion of light, but a dead straight cut from the outer edge of the wick.

1770–1. (*Sir F. Evans*). You are only dealing with the red?—Yes. Now if you extend it you have 1,275 feet at 3 miles, and if you extend it as far as you generally see the lights you have 1,700 feet at 4 miles. Now allowing that there is 3° diffusion of light in addition, you see how very much, as you come along, you would have the red light. Now *here* is a ship at 4 miles off just coming up, and allowing the diffusion of light to be 3° beyond the actual screening, you would have this vessel right in the red light of the first steamer. There is no getting out of that fact. Further, the man on the first ship sees the second ship's red light. Here are two vessels, each actually in the red lights of one another, with not the slightest necessity, as far as the line of their keels is concerned, to do anything but keep their course, and it creates the element of doubt, which is what you do not want. *Here* is the green light showing also; *here* is his mast-head light, and *here* is his red light also, and here is my mast-head light, and my red light, and my green light. There is no necessity of either of us to alter our course. The probability is that one of us will. I am going to port to that red light.

1772. (*Chairman.*) Which it would be his duty to do, practically speaking?—Yes; that is how the thing works out. Now there is another thing; there are the 4° across the bow. Now, supposing that was a clean cut and there was no diffusion of light, that is pretty much what is ahead of your ship when you are looking ahead, but if you introduce the diffusion to the extent of another 3° you would have your red lights showing much further across.

1773. You get so much more?—Yes, and the other ship is the same.

1774. I should like to know your view about the dark lane?—Now there are two laws, as far as I can make out, in connexion with this dark lane; there is the law of optics which I know very little about, therefore I do not go in for that. The distance between the lights is 50 feet; now if those lights cut straight, without any diffusion at all, they would simply go round the world and come to where they came from, and they would be simply 50 feet apart all the way; but, according to the law of optics, or, in other words, narrowing in, if you subtend an angle like this by a dark lane of 50 feet—you then have this result, that if, which I should not like to see, you were sitting on a rock a quarter of a mile ahead of the ship, and the ship was not deviating the least to port or to starboard, she would come right over you, and you would never see the side lights; that is, with a clean cut light and no diffusion. But if that vessel deviated, the angle at a quarter of a mile is 1° 53′, and if she oscillate 1° either way you would see the light owing to the narrowing in. As I said just now, the optical view of things is that, as you go from them, you narrow them, and at half a mile it comes to 56½′. If you were to sit there you would not see the light, but if the ship oscillates the least bit you would.

1775. So that even supposing the dark lane ahead was really an absolutely dark lane, the effect would be limited to those very small degrees of variation?—A quarter of a mile, half a mile, and so on. Then you must consider this; that were you to ask any captain, pilot, or master of a ship that has navigated the 80 millions of tonnage that passes up and down the Channel in 12 months, I do not think you would get any one of them to say they ever have seen a dark lane. In times past and times present, we suppose things were the same, but in times that are past, you went in for more crossing of the lights. I do not think I can tell you anything more about this.

1776. (*Mr. Scrutton.*) May I ask one question in explanation. This is arranged for 4° screening?—At 4°.

1777. Then you speak afterwards of 3°. What did you mean by that?—Diffusion of light. This is done as though there is no diffusion of light in any sense at all.

1778. Then what is meant by the diffusion of light at 4 miles distant. Diffusion of light could not interfere at 4 miles distant?—Then you would have exactly what I have drawn out.

1779. Then you would come back to your 4°?—4°.

1780. (*Chairman.*) The rule is now to screen 4° from the outer edge of the wick. Apart from the question as to the size of the angle, do you think it is a convenient plan to screen from the outside of the wick, and take that as a point and fix the screen up?—I think the outside of the wick is a convenient plan, and I also think screening ought to be done at night and not in the day-time, so that you can really see what it is. When you do it in the day-time, there is a certain element of doubt, some crossing at 1°, some at 7°, some at 11°, one at 12°, and one crossing about the foremast. It is a peculiar fact this crossing of the light about the foremast; you could see his lights, but you could not tell what position the ship was in, if he was going to port or starboard.

1781. I want to ask you the view you take of the objection which is put forward on behalf of the Board of Trade, which suggests that if the lights did not cross at all you might have two vessels approaching one another green to green, and that if both vessels kept exactly the same courses, they would, in fact, come into contact with one another. Now these models are at the present moment, strictly speaking, green to green, and supposing the lights do not cross at all, this vessel would see only the green light of that vessel, and that vessel would see only the green light of this vessel. In other words they would be green to green, and if they were to keep their strict course, there would be a collision, if not of the ships, at any rate of their yard arms. Now it is suggested that that is a position of danger, whereas green to green is supposed to be a position of perfect safety. That is suggested as the reason why the light should cross to some extent?—As a matter of fact, if that was the position in practice such as you put it, no two vessels would keep on like that; either one would starboard and see the other was doing so, or probably both would starboard if they wanted to starboard; but, according to what I have already stated, this fellow would most likely port his helm; he is far more likely to do that than to starboard.

1782. You think there is too much porting?—There is; that has been the curse, and has brought about more collisions than anything else, and we have to contend with that.

1783. But you think in practice they would not act like that?—I do not think in practice any two ships would act like that.

1784. Of course, it is the duty of each ship to watch the advancing light of the other?—You could not do it. It is not possible. This vessel would oscillate. I never find fault with a quarter-master if they keep to 2° of the course, but as to keeping to 1° that they cannot do.

1785. That is considered good steering?—Yes, I never grumble at 2°.

1786. (*Sir F. Evans.*) I have not heard any question put as to the degree of rolling?—You may make use of another word, yawing.

1787. It was only as to this question as to 1°. That is a very little when you take the size of the ship. What line was that you are speaking of, a man sitting on a rock right a-head of the vessel?—I have worked it out. That is what it comes to, 1° 53′.

1788. One and-a-half?—2° you may term it.

1789. Two degrees of rolling?—Yes, of yawing.

1790. Oh, you mean the yaw of the ship?—Yes.

1791. I did not understand you then?—That is what I meant.

1792. (*Chairman.*) It has been suggested that some consideration ought to be given to the fact that vessels very often have a considerable list. Have you noticed, at all, whether that list has any practical effect in altering the angle at which the lights are seen?—Yes, one light will appear higher than the other.

1793. And, more than that, if the vessel is down a good deal, the flame remains, of course, perpendicular, but the effect of the chock turning over is to obscure it?—It would be so.

1794. Do vessels come to the Thames with much list?—I have seen, perhaps, one or two in 12 months with a list, but there is more seen of that in ships at Liverpool.

1795. Now with regard to screening, I suppose it is more important in narrow waters than in the open sea?—I have spoken to several of the river pilots in my time about the crossing of the lights, and their opinion is it would never do for them up in the Pool, and all round about London. They say they want the lights not to cross. You see you may have three or four steamers, and the lights are all crossing. I have seen them coming down three abreast in Gravesend Reach; and you may take seven steamers, and I will guarantee that you may stand on the bank at Gravesend and not one of the lights will you see the same. Some you can see half a mile, some one mile, some two, some four even, in that short distance. There is no uniformity in the power of side-lights.

1796. That depends upon the strength of the light?—On the power of the side lights which they are carrying, and the glass of the side lights, and the position of the mast head light. If the side lights of every ship were uniform it would be a great advantage. There are a great many steamers who have their side lights on the fore-castle, and others have them on the bridge. Vessels performing the same manœuvre do not present the same appearance.

1797–8. You lay great stress upon their being uniform as far as possible?—Yes. If you look at that light you will see how it is. There ought to be a uniform effect in the screening of side lights; there ought to be no element of doubt. What we are driving at, I understand, is to minimise all doubt.

1799. (*Mr. Bolam.*) Where would you put the side lights?—Astern of the mast head light.

1800. Abaft the foremast?—Yes.

1801. (*Chairman.*) Would you think the lights ought to be always kept abaft the foremast?—Yes, I do, for the reason I gave you, to modify the rays of light that are passing around the bow.

1802. (*Rear-Admiral Andoe.*) They have to place side lights where they can?—In aiming at the impossible we get the best light.

1803. You would have to build the ship for the side lights instead of placing the side lights according to the build of the ship?—Well, I do not know how that may be.

1804. In navigating the narrow channels of the Thames like the Ooze or the Edinburgh, or any of the narrow channels at night, are you guided more by local considerations; that is to say, do you keep always on one side of the channel or the other irrespective of the bow lights of the ship which is approaching you?—We keep our own side aboard as much as ever we can; that is to say, we keep our starboard shore going down.

1805. Supposing you see a vessel approaching you showing her two bow lights, would you cross over the channel, or expect her to move till she got on to her proper side of the channel?—If there were any element of doubt in the matter I should stop my ship.

1806. But you would not go the wrong side of your channel?—Not if I could help it.

1807. If you could not help it of course you would; therefore, whenever you see two lights coming down upon you, you trust that the experienced pilot who knows the local considerations of the channel, will keep on his side and clear you?—That is what we expect he will do. There is one exception to that; at low-water time it cannot be helped, if we are going down on the lowest part of the tide when there is just sufficient water. If we see we cannot port without going ashore, and we cannot starboard very far without going ashore, and if any steamers were coming up and they tried to insist upon porting their helm, I simply stop and let them do what they like. If they like to cross my bows I cannot help it.

1808. The side lights are no particular guide to you, because you know you must keep in a certain position in the channel?—And you stop.

1809. And you trust the other ship having an experienced pilot on board will do the right thing?—Yes, we expect they will do so.

1810. Do many collisions take place between steamers at night in the narrow waters at the entrance of the Thames?—There have not been very many. The cases of the collisions are up in the Lower Hope and Gravesend Reach. Lower down we have been very free, considering the amount of traffic, from collisions.

1811. But compared with the collisions that take place in the Channel?—There are less in the estuary of the Thames and more in the Channel.

1812. Does not the fact of all large vessels that are in the narrow waters having a pilot on board account for there being fewer collisions?—I should think it does.

1813. As they perfectly understand the action each other will take?—Certainly it does, and if all ships were made to carry pilots up and down the estuary of the Thames it would be a very great blessing.

1814. Are you of opinion that for safe navigation by pilots in narrow waters it is desirable side lights should show as strongly right ahead as anywhere on the bow? As clearly right ahead as on the bow?—I see no reason why it should not, beyond what I have already stated.

1815. You think it desirable the lights should do so?—It is desirable that you should show the full light for this simple reason.

1816. One moment; before the 4° regulation for screening side lights came up, were you fully aware of the fact that the rays of light did cross on most ships?—Only from what I saw and from what I thought was wrong; beyond that I was not aware of it. I believed the regulation was being carried out.

1817. You remarked just now you never saw a dark lane?—No, I do not know that ever I did.

1818. You think that is the general opinion of ship-masters?—I am not saying there is not a dark lane.

1819. Does not that point to the fact that the rays of light must have always crossed?—They may have crossed. The 3° diffusion would certainly do away with the dark lane.

1820. If the screens are so placed that a line from the inner edge of the wick to the outer edge of the chock is parallel to the keel, and consequently in the fore and aft line, you are aware, I presume, that the light from the wick must cross the bow at a certain angle?—Yes, from the outer edge of the wick.

1821–2. Well, at first the whole breadth of the wick. The line drawn from the inner edge of the wick to the outer edge of the chock being parallel to the keel is a straight fore and aft line. Therefore, the breadth of the

*Mr. T. T. Hogg.*

9 May 1895.

wick outside that line must show a certain amount of light across the bow; it is practically impossible to prevent it. Do you admit that?—If that be so you simply still further confirm the fact that the dark lane has no importance as a consideration.

1823. (*Sir F. Evans.*) Reverting to your answer just now. You take the breadth of the wick at about an inch and a half, do you not?—Something like that, an inch and a quarter, or an inch.

1824. It is not material as to the exact width, but supposing it to be an inch and a half, and you were to take a line from the inner edge of the wick to the outer edge of the chock and make that parallel to the keel, the outer edge would be placed at an angle.

(*Mr. Bolam.*) With the 36 inch screen it is 1° 36′, and with a screen the Germans use it is 1° 27′; that is, one and a half degrees on the average.

(*Chairman.*) We have always called it one and a half.

1825. (*Sir F. Evans.*) If you call it one and a half, then, it would have this advantage: ahead of the ship the full light would show, and it would have the advantage according to your views as I understand them, that it would throw the point where they converge at the greatest possible distance away from the bow of the ship, provided you may see the full light?—Yes.

1826. Do you think that if you can throw this point as far as possible away from the ship that increases the safety of the ship, do I understand you to say that. Do I not make myself quite clear?—Yes, you make yourself perfectly clear, but what I have said is simply this, that that light showing right parallel with the line of the keel wherever it cuts, the full volume of that light ought to be seen.

1827. So it would if you train it from the inside of the wick to the outer edge of the chock; that would give a full light right ahead of the ship?—That is all we want.

1828. Now if you take the outer edge of the light to the outside edge of the wick, that will give you as a result an angle of 1½°. Now I want to ask you why you said 3° in your evidence just now?—I have not said so in my evidence. I did not say anything about it. I spoke about the diffusion of light.

1829. (*Chairman.*) You said 3° of diffusion?—That is all.

1830. What you meant to convey was that apart from the full range of light you ought to add 3° more for the diffused rays?—Yes.

1831. (*Sir F. Evans.*) As I understood, you said that 3° was the right degree to screen it?—Oh, no.

1832. Afterwards you said you assumed the diffusion of light as 3° in addition to the screening, whatever that may be. I want to get clear what your views are. Do you think it is sufficient if you screen from the inside edge of the wick to the outer edge of the chock, so as to get the full light and minimize in that way the angle at which the lights must cross?—Yes.

1833. (*Captain Thomson.*) Has your experience in piloting ships and avoiding collisions been mostly between Dungeness and Gravesend for some years?—The Isle of Wight and Gravesend.

1834. You said there are certain men in charge of ships at sea who always, or very often, port their helm?—To a green light.

1835. If they have occasion to think that the green light seen is that of a ship meeting them?—On the bridge we can see the sins of other people, and we are unconscious of our own, and if there are any sins on our bridge we have not been conscious of them. I will give you one case which occurred at night about a fortnight ago. I was between Dungeness, and the "Royal Sovereign," and a steamer was on my starboard bow 4 points. I saw him with his masthead and green light, and practically had no reason to think anything more about him. We were travelling about 13 knots. The first thing I saw was he put his helm hard-a-port and tried to cross my bows. He could not actually reach us. Then, when he found he could not reach us, he starboarded his helm and kept his course again. Can you conceive of such a thing as that? There was not any question of rays of light.

1836. (*Captain Castle.*) Where was he?—4 points on my starboard bow.

1837. Four degrees?—No, 4 points right away on my starboard bow. I could see his masthead and green light, and the next thing I saw was his working over to port to try to see my red light, and he could not reach us.

1838. (*Captain Thomson.*) That is the worst case, I suppose, you have known?—That is the worst case.

1839. You have seen other cases?—About three weeks ago there were three steamers showing their masthead lights and green lights off Folkestone, and they saw mine. With all this angling the first man kept his course, the second put his helm hard-a-port and he had to throw himself right across, and I had either to stop or angle and go under his stern. The third one kept his course and I was able to go under his stern. Then he starboarded and kept his course. These things are constantly occurring in the English Channel.

1840. Am I right in supposing from your experience that, when you approach a ship that you have reason to suppose is coming end on or nearly end on to you, and you only saw her green light, you would be rather careful as to whether you would starboard. You would not starboard to a ship that was going to port, or that you had reason to think might port?—If I had any element of doubt I would stop the ship.

1841. Therefore, when you have a ship end on to you, showing a green light which does not alter its position, you think the safest thing is to stop?—I do.

1842. Do not you think that in that case, or whenever it is a case for doubt, it would be much better if the rule to port, or to alter course to starboard were carried out by both ships?—When a green light is fine on the bow?

1843. Yes, or ahead?—Well, when you see three lights ahead, you port your helm and show your red.

1844. This is a case when you see only one light?—But why not both starboard in a case of that sort instead of both port, and give each other room?

1845. The only reason why you cannot both starboard is, that there is nothing in the Rule of the Road to tell you that you are both to starboard. You may starboard, but you do not know what the other man is going to do?—The probability is he will port.

1846. You see that that only occurs when your side lights are screened very fine. You could not see a green light only, or a green and white ahead or very fine on your starboard bow, if the ships are approaching end on, or nearly so, unless you have very fine screening; if the angle of screening was a little broader you would see both his lights then, and you would do what?—Well, if the masthead and the two lights were seen each man would port.

1847. There is no doubt about that, is there?—No, I agree to that.

1848. It is better, perhaps, to have some degree of crossing for that reason, so as to avoid any risk of one porting and the other starboarding when each of the two ships are meeting so as to come into collision?—I quite follow you.

1849. I am going to ask you with regard to the diffusion of light you mentioned. Have you any idea how that diffusion of light comes about?—No, I cannot go into that matter. I leave that to those who are able to deal with it.

1850. You think, practically, it will amount to about 3°?—That is my view.

1851. Therefore you think, at a distance of 400 or 500 yards, with 4° screening you would probably see a ship's light to about a 7° crossing angle?—That is just what it would be.

1852. And also when screened to 1° from the outside of the wick?—It would be equal to what you now state, 4°.

1853. (*Captain Castle.*) Speaking of a light right ahead, you say it should be in a line with the keel; do you mean the line of the keel with the stem, or the line from the lantern parallel with the keel?—I mean that a light should cut right ahead both sides to two points abaft the beam. I do not know where you are going to cut it from as regards the lamp. I cannot say.

1854. I want to know whether you would have it in a line with the keel, or in a line with the lantern?—What part of the lantern, the wick?

1855. Yes, the wick?—If you take the outer edge of the wick it would narrow it, and bring it to pretty much what you state.

1856. It would not show a bright light ahead?—Yes, it is essential to show a bright light, and the full volume of the light, because a shaded light would lead you on a dark night to think you were further off the ship than what you were. All lights ought to show their full volume if possible, because according to the intensity of the lights you are very much guided whether you are close to it, or far from it.

1857. The mast-head light is a certain guide too?—Oh, yes, you have got that all the time to guide you.

1858. That is a guide as well?—Yes.

1859. Do you think it is possible to have a uniform light in small vessels and large ships?—If you go into the River Thames you will see the barges have the best lights going, and that is the smallest class of vessels.

1860-1. But they do not go to sea?—No, but they have the best lights; and the man who is liable to be run over should have the best lights, for his own safety.

1862. With reference to keeping your own side going up the river, according to the Thames Conservancy rule, you have to keep your own side; but you meet lots of vessels, sailing vessels and schooners, reaching across the river?—It is purely a matter of judgment what you do then. We have a rule amongst ourselves that if you cannot get out of the way, you give four blasts, and let him get out of the way.

1863. But the Conservancy Rule are the same as the sea rules?—Yes, precisely, as far as that is concerned.

1864. And they hamper you very much at times, no doubt?—I should think so. We do the best, and they do the best. You cannot find very much fault with them. The barges are very much better than they used to be. When you are coming up amongst 400 or 500 barges it is a quick eye and a quick judgment to see what you have to do.

1865. (*Mr. Bolam.*) You have said that the pilots do not want the light to cross a fore-and-aft line?—No.

1866. Have you ever heard of any pilot who wanted the chock brought so as to come in front of the whole of the wick?—No.

1867. At the utmost they only want the chock brought fore-and-aft to the inner edge of the wick?—So I have heard.

1868. So that the person who is supposed to have advocated that the chock should obscure the whole of the wick does not exist, so far as you know?—No. Mind you, I am speaking of the river pilots from Gravesend up to the Albert Dock, and I am not one of them.

1869. When you say the pilots do not wish the lights to cross, you simply mean they do not want the full volume to cross, but they do not object to the diminished rays crossing?—I do not suppose they do, but that is very narrow water, a ship's length.

1870. In intricate navigation in channels, you said in reply to Rear-Admiral Andoe, of course in your vessel you give your vessel all your experience?—Naturally.

1871 And another vessel that you see coming in something like the opposite way, you also expect she is in charge of an experienced pilot?—Naturally.

1872. Is it always the case that the vessel you are meeting, and perhaps slightly crossing in the pilotage navigation, is in charge of a pilot?—Certainly not.

1873. So you do not know whether she is or is not in charge of a pilot—No; it is an element of doubt.

1874. (*Captain Hallett.*) Do not they fly a red flag?—We carry the flag, according to the instructions, night and day, but it would take a good pair of eyes to see it at night. They may see it on a moonlight night, but otherwise you could not see it.

1875. (*Mr. Bolam.*) You have drawn a sharp distinction between the full light, and the reduced rays, and the diffused rays; can you give me any idea how far from the other ship at the utmost you have seen the diffused rays—that is, the third type which you have named?—No, I could not.

1876. Can you say whether you have seen the diffused rays at a long distance from the other ship, or is it only at a short distance?—Oh, that is a question I could not answer.

1877. Could you not give any idea, because it is a matter of considerable importance?—The fact of the matter is that it is so regulated by the state of the atmosphere that you really could not tell. The other day I saw a light of one light ship apparently stuck on top of the other; all the way down the mirage was so great that it would give a very peculiar effect to any light. Some nights it is perfectly clear, and other nights it is so peculiar, when probably the atmosphere is thickened by a southerly wind, which gives very different results.

1878. Can you say what in your experience in the British India Company, and the other large companies' ships, with an experienced man at the helm, is the very finest steering that can possibly occur, for instance, the British India Company's vessels?—Well, I should say a couple of degrees on each side of the course. I should not grumble at that.

1879. But can you steer finer?—I do not think so.

1880. A witness yesterday gave us some information about yawing generally. Can you give us your experience as to what other vessels would yaw—tramps for instance?—Not particular to half a point.

1881. Or sailing vessels going free?—They will yaw too.

1882. How much?—Going free they will generally come up probably a point, and running—the last ship I had running took three points each way.

1883. And a ship sharp braced up?—Well, if they are fine ships, they will pretty well, in my opinion, come down very small, probably to a quarter of a point.

1884. When you see a green light a little on your starboard bow, and the bearing does not change perceptibly, it is green to green still, is it not?—Yes.

1885. Do you believe that is "perfect safety, go ahead"?—It has just been demonstrated that it is not.

1886. Did you ever believe that it was "perfect safety, go ahead"?—No; I am sure I would not keep my vessel in that position.

1887. Supposing lights are screened so as to be hidden just 4° from stem on; would that 4° be a sufficient angle of safety so that master and mates at sea could always say that whenever a green light is shown to a green light at an apparently small angle, that would be safety?—That would be better.

1888. If the other ship is just ahead with an angle of 4° and stem on to you, and you are stem on to her with a 4° angle?—She would pass 1,700 feet on my starboard side at that.

1889. It depends upon the distance you are off when you see each other to begin with?—Yes; but she would be coming along that line. This chart demonstrates that fact.

1890. Then do you think that 4° in the case of ships that see each other at a very long distance off to begin with, would be a sufficient angle of safety?—I can measure it off.

1891. In a general way?—In a general way, taking ships as they go, if the vessel was fine on the bows, 4° or half a point as the case might be, at half a point of course they would go clear; but each would starboard his helm to show the other what he is doing, naturally, and they would not come into collision.

1892. So that when vessels, even with the 4° angle of screening, each see the green light just with the red out of sight, instead of saying "perfect safety, go ahead," each would starboard his helm a little, so as to throw the other a little more on the starboard bow?—They would both starboard.

1893. So that in point of fact, if with the 4° angle—as compared with the 3° angle—it is always alleged that you have "perfect safety, go ahead," that would not really be a much better angle than the 2°?—It would be practically the same.

1894. Take, for example, the man you mentioned who was four points on your bow and altered his helm; 4 degrees would not satisfy him?—No.

1895. (*Mr. Scrutton.*) You spoke about it being necessary to be on the wrong side going down river, because of the want of depth of water. That is a matter that could be remedied by dredging?—Yes. That is a matter which I pointed out, if you remember.

*Mr. T. T. Hogg.*

9 May 1895.

1896. Do you know the proportion of vessels that come up the river, and have regular pilots?—They all take their pilots at Dungeness.

1897. That is not my question?—I do not know the number that come up the river without pilots.

1898. Have you any idea of what the proportion of ships that come up without pilots bears to the proportion that come up with pilots?—I do not know the number.

1899. I will tell you; the regular pilots only take one vessel out of four?—That I do not know.

1,900. This is got from the returns, that out of 54,000 vessels that are reported in the year, it averages very little over 12,000 who come through with pilots.

(*Rear-Admiral Andoe.*) Steamers?

(*Mr. Scrutton.*) All sorts, every registered mercantile vessel.

1901. Those, of course, that have not regular pilots, the captains and mates who pilot them have to pass an examination, have they not?—Yes.

1902. That is sufficient, is it not; they have to satisfy the Trinity House that they are competent to take charge of their own ships, have they not?—Up and down, certain vessels. They are not put through the same examination as a regular pilot.

1903. Would you hold that they are as efficient as the regular ones?—Certainly not.

1904. Do you consider that to be an element of danger in the river?—I am not talking about that at all.

1905. No, but I am asking you the question?—No; it has nothing to do with the side lights.

1906. Supposing the lights were screened parallel, without any angle, would you expect, if you were a mile off, with a vessel right ahead, to see both those lights?—You would see them—well you have got one degree.

1907. No; I am supposing, for the sake of illustration, that the two vessels are approaching one another absolutely on the same line?—You could not; but if you are a quarter of a mile off, let alone a mile off, and you yaw just a degree one way or the other, you would see the light—as the ship yawed a degree one way or the other you would see the light.

1908. That is your judgment?—Yes.

1909. Is it a matter of opinion, or do you think you could say you have seen it?—It is a matter of calculation.

1910. (*Sir Edward Harland.*) If the chock was placed so that a true line from the inner edge of the wick would just clear that chock, and assuming that the wick were an inch and a half, or an inch and a quarter in width, would, you consider that the ray of light—a slightly reduced ray of light—would, at some distance ahead of the ship, cross the line of the vessel sufficient for your purpose?—Yes.

1911. You expressed yourself upon that subject satisfied with the ray crossing the line of the vessel to that extent? Yes.

1912. To pursue that a little further; supposing that the chock of the screen was thicker and the line drawn from the outside of the wick just passed the chock; would that be an improvement, do you think?—I think from what has gone before, and from what people have talked—I am not an expert in these things—that the outer edge of the wick is the proper thing to take it from, whatever the results may be.

1913. That is, taking it from the outer edge of the wick. Supposing, for instance, that the screening was such that the ray from the outer edge of the wick would just pass the chock and run parallel to the keel, do you consider it would practically mean rather widening the dark lane. Would you be in favour of that?—Yes, I prefer the outer edge of the wick.

1914. (*Chairman.*) May I interrupt with one question. I do not quite understand. Do I understand that you would like to see the light screened in a line parallel with the keel from the outer edge of the wick, so that in point of fact that chock would completely cover the wick?—No, I did not want the chock to cover the wick at all. I do not know exactly what you are driving at. You must clearly understand I have nothing to do with the fixing of the light or the screen, or anything else. I am simply dealing with the point from which you can see them.

1915. (*Sir Edward Harland.*) Do you think that at half a mile, or a mile, or even two miles distance, the rays of light from the wick would still find their way by the process of diffusion?—By the process of diffusion and also by the law of optics; according to the description you have given they would.

1916. What would you compare the green or red rays of light in this lamp with, would you compare the process of diffusion in this light as something like what we all know is the case with the electric lights in a fog where the whole atmosphere is filled with the diffused rays of light, and at the same time you cannot see where the light comes from?—No doubt in a fog you cannot see the electric light at all.

1917. But you see the diffused light in the atmosphere?—Sometimes you do not do that.

1918. I am putting these questions from the circumstance of your showing us your drawing, and you describe the lines you had laid down as lines of 4°?—4°.

1919. At a certain point they crossed, and after that the port light showed on the starboard side—the green light showed on the port side a little bit, you said, in addition to the 4°. I think you said there was 3° diffusion?—That is merely a matter of opinion, I cannot put that down for a positive fact.

1920. Are you speaking of it from experience, or are you speaking of it merely as a matter of opinion?—I have been merely speaking from what I have been told as to the theory of 3° approximately.

1921. Then you have not calculated it yourself?—No, I have not.

1922. In some ships the side lights are abaft the foremast or abaft the mast-head light, and in some ships they are forward of the mast-head light, and other ships they are on the bridge; but in a good many ships, particularly sailing ships, the side lights are on the forecastle, frequently in lighthouses?—Sailing ships have no mast-head lights; do not forget that.

1923. There are many steamers which have the side lights on the forecastle in lighthouses?—Yes.

1924. Do you say there is any advantage in so placing the mast-head light relatively with the side lights that, when you are going end on to a ship, you could see pretty nearly in what direction a steamer is ahead of you or crossing your bows, as the case may be?—You would have to have two mast-head lights.

1925. No. Supposing the side lights are on the forecastle, do you think there would be any advantage in having the side lights placed with the mast-head light at a certain known and appointed angle, so that when the ship altered her course, you would be able to judge by the angle as to the course the ship was then on?—Everybody is perfectly agreeable to anything where uniformity comes in, but where there is one light *there*, and another abaft, and another abeam, it is certainly very wrong, and it does not matter which way you have it. If you put it like *that* you should become accustomed to it. It is purely a matter of opinion. I personally prefer them on the bridge, because it takes years before you get others to get the bridge idea out of their brains.

1926. Assuming that the side lights were placed on the bridge, but assuming the mast-head lights were placed somewhere at an angle of 45° up aloft more forward of the bridge, like *that*, it would be an advantage?—Well, if you could keep any particular angle it is better than an unknown angle.

1927. I am referring now to the question of placing the lights for this reason: supposing the side lights are on the bridge, but that the mast-head light is immediately below the side lights, then you will see—we will put the matter of the mast out of the question for the moment—you will see that no matter how the ship was approaching you, as the mast-head light was pretty nearly plumb with the side lights, you would not be able to judge as to the course of the ship coming towards you?—No. I quite follow what you say, but the suggestion was thrown out, I do not know whether by Sir Digby Murray or not, of having the lights on the bridge, and having your mast-head light forward where it is at the present time, and having another bright light at a given angle, by which you could always tell whether she was porting or starboarding, or the angle that the ship was at.

1928. Then, upon that point you yourself have not formed any very definite opinion?—I have not. I have not gone into the matter of which you are speaking at all. I am merely taking it, judging from what I have seen, that the arrangement of the mast-head light is the best.

1929–30. But I suppose you are taking it that most vessels either have the mast-head light forward or abaft the side lights?—Yes.

1931. (*Chairman.*) I want to get your view quite clearly. Figure No. 1 represents the chock screening the wick, in a line parallel with the keel, from the outer edge of the wick. No. 2 represents the same thing, with the chock screening the inner edge of the wick. Do I understand you to say that you would be satisfied, practically, with the screen as represented in figure No. 2; that is to say, a line drawn parallel to the inner edge of the wick?—To the inner edge? Yes; it gives the full light.

1932. Of course, if you have it screened as in No. 1, that is to say, the line drawn from the outer edge of the wick, and the whole wick covered, then there is not a full light shown ahead?—Quite so.

1933. And you appreciate the value of the international rule which says that it is the full light which is to be shown ahead?—Yes.

1934. (*Rear-Admiral Andoe.*) Have you witnessed any experiments which would enable you to form the opinion you have expressed regarding diffused light?—I have not had the opportunity of following out that experiment.

1935. Have you made any special study of optics which enables you to speak with authority as to the theories regarding them?—It is very easily demonstrated as far as optics are concerned. If you see two lights which appear very close together on the water, you find when you arrive at those lights that they are really very far apart.

1936. You do not understand me. Have you studied the question from that point of view?—I have told you already I have not done so.

1937. Is it not the duty of every officer and captain of a steamer to use night glasses, and are they not generally in use by them?—Oh, yes, we have the best we can get.

1938. I mention that because you refer to trusting the look-out man's eyesight?—Yes; but at the same time I said it was not a fair thing to do to judge by the look-out man's eyesight. We have good night glasses—the best we can get—therefore we are able to see further.

1939. You said just now that you thought that the side lights ought to be tested experimentally?— I did, in the chock.

1940. To prove that they are properly placed?—I think so, at night.

1941. Do you think that is practicable in the crowded docks, considering the limited space in which these vessels are?—There is nothing impossible in it if you have got a good long dock, such as the Albert Dock.

1942. In a crowded dock full of shipping and of limited space, would it not be impracticable?—You could take the centre. It was demonstrated according to a letter I saw some time since about the screening of one of the steamers. I do not know whether it was at Cardiff—one of those places—and they were supposed to be screened to 4°, and at night time the lights were lit and shone on to the sheds, and the angles were taken very carefully, and one showed 13° and the other 14°. I can quite follow your meaning.

1943. You gave just now an instance of a ship approaching you 4 points on the starboard bow, which put her helm hard a port and altered across your bows, and then put her helm hard a starboard, and run back again. You did not, I suppose, refer to that in any way as affecting the position of the screening of the lights?—Oh, no, I say it had nothing to do with the screening of the lights ordinarily. I said that was a thing you have to meet in the Channel. I said that with side lights crossing the bows and with a man of that description, if they had a good light, that they would put their helm hard a port.

1944. It did not bear upon the question of the screening of the side lights?—Not at all. I did not say it did.

1945. Do not the majority of the steamers coming up the Thames, in the narrow channels of the Thames—I mean from the Tongue light up—usually come up in charge of pilots?—All the coasting steamers, such as steamers coming across from Amsterdam and Rotterdam, and Calais, they are not in charge of pilots, as a rule.

1946. There is no local rule by which they are obliged to take pilots up as far as Gravesend?—No, but there ought to be one right up as far as Gravesend.

1947. What is the regulation now. Cannot a steamer approach as far as Gravesend without a pilot, if he chooses?—Between Brest on the one side and the North channel on the other, which really now means the Baltic, they can now navigate up without a pilot.

1948. (*Captain Castle.*) They call them exempt ships?—They call them exempt ships.

1949. (*Rear-Admiral Andoe.*) And they come up as far as the Nore without a pilot?—Yes, as far as Gravesend.

1950. Any ship?—Not any ship, only ships exempt from compulsory pilotage.

1951. What are the exempt ships?—Any place between Brest on the one side, and say the Baltic on the other side. If you come from any place there you are free.

1952. And it is the practice of those ships to come up without a pilot?—Yes, as a rule, I should think it is.

1953. (*Mr. Bolam.*) When you speak of the diffused rays crossing 3° in addition to those from the wick, are you speaking of what you saw, or is that hearsay? Have you seen the diffused rays, or is it only hearsay?—No, I have not seen them. I am only giving you my own judgment.

1954. (*Captain Thomson.*) There is one thing I should like to make clear. I understood you to say that there are some men in charge of ships that you had met in the river and the channel and approaches, who port their helm to a green light very often, or a glimmer of a red light on the starboard bow, as well as the green. I also understood you to explain to me that you thought in the case of a green light being seen fine.—It is the most dangerous thing you can see.

1955. That if the screening had been broader they would have ported of course, but they would have seen both lights, instead of the green only?—Yes.

1956. But then, you would have ported also; no doubt in that case?—No doubt. If I had seen what he had done—you know we do not come close together. Before anything of that kind arises people either port or keep their course, as the case may be, long before they meet each other. If the vessel ported her helm I should be compelled to do so to keep clear of him.

1957. If a man ported to your green light seen fine, of course you are not bound to port. You might starboard, might you not?—I would stop if there was any element of danger at all.

1958. But there is nothing to prevent you starboarding?—Supposing I had?

1959. If the lights were screened broader, he would port as before, but now there is no question as to what you would do; you would also port, and, therefore, there would be no danger?—I quite follow you.

1960. Therefore, do not you think that this question of porting to a meeting vessel showing a green light only has to do with the screening of side lights? In the one case, you see, there is doubt when they are screened fine, and in the other case, when they are screened broad, there is no doubt?—I apprehend that the trouble and care you are taking is to modify collisions, and to bring about a better state of things than has hitherto existed; and you will have the thanks of all the pilots in the matter.

1961. But I should like to make it clear that when a man ports to a green light seen fine, or a green light with a glimmer of the red light, the question of screening comes in, does not it?—I think so.

1962. (*Sir E. Harland.*) There is one thing I should like to refer to, with reference to the sinking of the "Elbe." It was mentioned at the time, I think, that these big powerful ships were disinclined to give way to smaller ones coming up in close proximity. That the custom with the big steamers, especially continental steamers, was not to give way, but to expect the small craft to do so. I am not referring to the custom with regard to British ships. But what is your experience upon that point? Have you found the large and powerful ships look to the smaller craft giving way to them, or that each, be they big or small, considers it her duty to obey the rule of the road?—No, we keep away. Are you alluding to the British India boats?

1963. No, not to anything in particular?—Very well. We do our best to keep away. If there is only a little jollyboat 10 feet long we keep out of its way.

*Mr. G. H. Little.*

9 May 1895.

Mr. GEORGE HERBERT LITTLE called and examined.

1964. (*Chairman.*) I think you are a master mariner, are you not?—Yes.

1965. Will you tell me what your experience has been?—I have had about 14 or 15 years in all kinds of steamers, in sailing ships, and up to chief officer in cable steamers and tank steamers, and in fast mail steamers out in the East.

1966. How long were you master?—I have not been a master. I say as far as chief officer.

1967. You say you have served in all classes of vessels?—Yes; and in the last few years I may say I have been very much connected with the trial of steamers, such as torpedo and mail steamers, and I do a lot of compass adjusting. Therefore, I am in a very good position to see a good deal of shipping which I should not see if I was simply at sea.

1968. And have you had to do with the navigation of ships, both in open waters and in narrow waters?—Oh, yes, considerably.

1969. Before the present Board of Trade 4° rule, what do you think—from your experience—was the screening of the side lights of vessels?—Well, sir, it is hardly a question of experience so much as one of actual fact. The actual fact is that these rays always have shown across the bows. It follows, as a natural consequence, from the shape of side lights, that the rays must cross, and ought to cross.

1970. To what extent do you think the rays have crossed?—Perhaps this illustrates it better by showing you the crossing. [*The witness produced a diagram, which he explained to the Committee.*]

1971. You will agree, of course, that, unless the chock is kept within the line of the inner edge of the wick, that you cannot see the full light?—No, you cannot see the full light; you can see the secondary rays. It is hardly the correct word to use, but it is difficult to find a better one—obscure rays, perhaps.

1972. What sort of power have those rays; at what sort of distance would they be seen?—I have made some experiments, but not sufficient to be of any value, and I really could not say; but I know this much, that if you stand very close to the bows of a ship you will see the different rays quite close to the stem; in fact, last summer, when this question was agitated, I stood at London Bridge and saw a very small dark lane indeed, a few feet before the stem of the ship. This plan is supposed to show you the lights as screened according to the old-fashioned rule.

1973. (*Mr. Bolam.*) Will you kindly tell us what you mean by the old-fashioned rule?—That is, with the chock coming out when the rays of light are parallel with the keel [*describing*]. There is another point I should like to mention with regard to seeing the rays of light abaft the 2 points—that is, the case which occurred in the disaster of the "Elbe." There you have a case in point. The "Crathie" ran into the "Elbe" because these lights did not extend far enough abaft. It is a help to a steamer to have the rays showing 2 points abaft, and I suggest, instead of having the side lights limited to throwing the lights 2 points abaft the beam, it should be more than that. Had the light been thrown 4 points abaft the beam, the "Crathie" would have seen her.

1974. There is a stern light, is there not, and the ship is really lighted all the way round?—That is hardly so in those large mail steamers.

1975. (*Chairman.*) What we wanted was your opinion about the Board of Trade rule; do you think it is a good rule?—No, I do not think it is, because when you have the two side lights in view it indicates one fact, that the vessel is coming straight for you. If you have the 4° rule, it is quite possible to see, not only one side light, but also the other, and you lose the whole distinctive value which you have of seeing two lights ahead. For instance, supposing I see a steamer's red light a little on my starboard bow, that vessel may be going anywhere on the opposite bearing and 10 points to the right. Suppose I just see a scintillation of the green light, she appears to be coming for me when she is really crossing. If I see both lights full, I know she is coming dead on to me; but supposing I see the red light and also the faint scintillation of the green light, it shows me she is not coming dead for me.

1976. Do you think that the screening should be arranged so as to prevent the rays crossing as much as possible?—Yes. If you follow the logical conclusion of Article 3, you cannot fix the side lights at present so that the rays do not cross.

1977. Clearly not. I think we are agreed just now that if you are to have a full, uniform light of 10 points, the rays must cross; but I want to know what your view is—whether you think the crossing should be as little as possible, or whether you think something should be adopted to make the 4° angle, larger?—I think the angle should be as little as possible. I think it should not be more than one or two degrees.

1978. Do you think any danger will arise from having the lights screened as fine as that?—Yes, I do; because, if you have the lights diverging, it is difficult for an observer on another ship seeing those two lights to say exactly where they are.

1979. You are not quite following the question. I understood you to say you thought there was danger in having the lights screened to as much as 4°. I was turning it the other way. Supposing they were screened fine, do you think that that causes danger? You know it is suggested by the Board of Trade that it does?—Yes; I understood you to refer to the lights being screened finer than 4°. I do think it is less danger then [*describing with the plan*].

1980. So you mean there is a larger area over which a vessel is not certain what the course of the other one is?—Yes.

1981. As regards the area of screening, it does not matter in your judgment, does it, whether the screening is from the outer edge of the wick, or the inner?—The screening from the wick, is an incorrect and unsatisfactory manner of screening—the wick ought to be circular.

1982. What rule would you like to suggest for screening?—I should say, if it were possible to devise such a thing as I think might be done, in time, that it should be in accordance with this diagram [*describing*].

1983. (*Mr. Bolam.*) Do you mean to say that you find a light where the wick is placed end on as strong as it is where the wick is placed broadside on?—No, I did not say that.

1984. How did you perform your experiment. If you performed it in the same way as I did, it will make your evidence of value?—But common sense tells you.

1984*a*. It is a dangerous thing to introduce common sense into optical experiments.

1985. (*Rear-Admiral Andoe.*) Might I ask if you have conducted any experiments?—Yes.

1986. On a large scale?—On a rough scale.

1987. Only on a rough scale?—Only on a rough scale.

1988. You have not gone through any very special training in optical matters?—Well, I was an engineer once with a firm in a large way in London—electrical engineers—and I had a lot to do with it.

1989. Have you ever been a captain of a ship?—No, never.

1990. What ship were you officer of?—I was chief officer in one of Captain Thomson's ships—in a cable steamer.

1991. How long have you served as chief officer?—For five years.

1992. (*Chairman.*) In your view the dark lane is not a matter really to be regarded?—No.

1993. But do you think any danger is likely to arise from the dark lane?—No, the dark lane has always existed, only seamen, as a rule, do not appreciate it.

1994. If you followed the screening of these lights, what system would you adopt?—I should put the lights' screens amidships (*describing on the plan*).

1995. (*Rear-Admiral Andoe.*) You would put the lights back to back?—Yes.

1996. (*Chairman.*) Your recommendation, as I understand it, is that there should be a complete change, and the lights should be put close to one another in a tower on the fore part of the ship?—Yes.

1997. (*Mr. Bolam.*) In sailing ships?—In sailing ships, no, because the speed is not so great in sailing ships, whereas the speed of steamers is increasing so greatly. I have seen it myself in torpedo boats. As the lights are screened, they do not give sufficient indication of what you are going to do.

1998. (*Chairman.*) However, what I understand is, you attach importance to uniformity in the lights which you see ahead?—Yes.

1999. And, therefore, if either of the two have to give way, you would say that you should see the lights ahead?—Yes.

2000. Even if you have to sacrifice to some extent the crossing?—Yes. I do not know whether it is necessary to show that; but I have another tracing which I have prepared [*produced*].

2001. (*Sir E. Harland.*) You have referred to having the red and green lights set back to back somewhere on the forecastle head?—Yes.

2002. Although probably 200 or 300 yards just immediately ahead of the ship you would not be able to distinctly define one light from the other. Suppose you were a mile away, do you think the two colours would be still as distinct?—No, the secondary rays in that case would pass also, but in that case it would be necessary to have the light screened out.

2003. But you think you would see a distinct red light and a distinct green light?—Undoubtedly. For instance, if you are on a railway, you can see the red light of a locomotive four or five miles, at the very least.

2004. But not two lights close together?—The red light.

2005. But here is a case of a red light being close to the green light?—Yes, but that leads me to another point [*referring to the diagram*].

2006. But, then, do you hold that at a considerable distance, a mile or two miles away, you would still be able to distinguish the colour, a defined light?—I do not see why you should not.

2007. Have you ever tried it?—No, I cannot say that I have.

2008. Then, theoretically, do you consider you should be able to see it?—Yes.

2009. But practically you do not know?—I do not see that it is a question which needs much practical demonstration.

2010. I am asking you the question, whether you can give me an answer from actual experience?—I think we attach too much value to this question of practical experience. It is not that; it is a question of scientific fact.

2011. But is not a scientific fact a question of practical experience?—I think not.

2012. (*Mr. Bolam.*) Do you really believe that your practical experience in this matter is of any value?—Oh, certainly, because certain practical experience is dead against what I have been saying this afternoon.

2013. But you would agree that all these matters ought to be subject to rigid experiments?—Exactly.

2014. And that those experiments ought to be properly conducted?—Yes, exactly.

---

## Wednesday, 15th May 1895.

PRESENT:

THE RIGHT HON. SIR FRANCIS H. JEUNE IN THE CHAIR.

Rear-Admiral ANDOE.
Captain WILSON BARKER.
Mr. BOLAM.
Captain CASTLE.
Sir FRANCIS EVANS.
Sir EDWARD HARLAND.
Captain HALLETT.
Mr. ISMAY.
Mr. SCRUTTON.
Captain THOMSON.

Mr. C. HIPWOOD, *Secretary*.

Captain JOCELYN FITZ-GERALD RUTHVEN called and examined.

2015. (*Chairman.*) You are the commander, I think, of the steamship "Ophir"?—Yes.

2016. What line?—The Orient Steam Navigation Company.

2017. In 1892, after the Board of Trade issued the new rules as to screening, I think you formed one of a deputation to the professional member of the Marine Department of the Board of Trade?—Yes.

2018. I think it was your object, was it not, to protest against this new regulation, and point out what you considered the dangers involved in it?—Yes.

2019. What did Sir Digby Murray tell you about it?—Well, he told us that, so far from it being an increase in the angles of convergence it was practically a decrease. That the angles of convergence up to that time had been very irregular indeed, and that the average angle of convergence up to that time was greater than this 4°, and he referred to the proceedings and recommendations of the Washington Conference, and also to his own experiments at Shoeburyness and elsewhere, and commented on our having no experiments to go upon.

2020. That was the fact, that at that time you had made no experiments?—I had made no actual experiments or measurements, but I knew that the chocks of the sidelights in my own steamer, which were fitted exactly the same, as nearly as possible, as the steamer which I had commanded previously, had been cut away so that the side lights should show across the bows very much more than they had ever done before in any of the steamers I had been in for many years; and I foresaw the great danger that would arise in navigation—that it would increase the risk of collision, and also that it might drive other vessels on or unpleasantly near some danger on the starboard side, because another steamer, seeing my lights with that broad angle of convergence (a sector of 8°, in which both lights were visible), would not know whether she was right ahead of my ship, or on my starboard bow, or on my port bow. To indicate this was one of the principal objects—perhaps the sole object—of the regulation that the side lights should not show across the bow.

2021. What, as a matter of actual experience in going down the Thames, or the English Channel, or along the coast of Spain, or elsewhere, did you find to be the result of the new rule?—We found that a large number of vessels that were on our starboard bow and that in daylight would have passed on that side ported their helms, and ran across our bow.

2022. In a crowded thoroughfare like the Channel, should you regard that as a source of danger?—Most assuredly.

2023. On one voyage I think you made certain experiments and calculations, did you not?—I did.

2024. And you embodied the experiments and the results of them in a paper in "The Nautical Magazine," did you not?—I did, and I subsequently wrote two more articles in the "Nautical Magazine" on the same subject.

*Capt.J.Fitz-G. Ruthven.*

15 May 1895.

2025. I think it would be convenient if you could give me at once the date of those articles?—The first one was in November 1892, the next one was in March 1893, and the last one was in June 1893.

2026. The conclusion which you expressed in those articles in effect was, I think, that the angle should be reduced to 2°, was it not?—In the first article that I wrote, I said 2°, fearing from what Sir D. Murray told us of the proceedings and recommendations of the Conference, that to get a larger reduction was hopeless. But the more I have studied this question, the more impressed I am that it is necessary to reduce the angle as much as possible to the very minimum that will fulfil the condition of the two side lights being seen ahead together in time to avert collision. The finer the side lights are screened to fulfil that condition, I think the better they serve the purpose for which they were introduced, and the more they reduce the risks to navigation.

2027. You speak of the lights being seen ahead. Do you also attach importance to the rule which directs that the full uniform light should be seen round 10 points?—I attach very little importance indeed to the fact of a full light and a uniform light being seen ahead except at long distances; the full power is not necessary at half or three-quarters of a mile. As long as the light is seen ahead, I think that is for all practical purposes of navigation quite sufficient, and it is very detrimental and risky to navigation that the lights should show so much ahead as to be seen across the bow of the vessel.

2028. So that if one or the other thing had to be sacrificed, I rather gather your view is to sacrifice complete uniformity over the 10 points than admit of the lights crossing?—Most assuredly and emphatically.

2029. When you spoke in that article you refer to of reducing the angle to 2°, I think the result of the Washington Conference had a certain effect on your mind, had it not?—Well, Sir Digby Murray, when he received us in deputation, attached great importance to the proceedings of the Washington Conference in support of his 4° angle. But when I read the proceedings of the Washington Conference for myself, I thought he misinterpreted their view, and I did not think it was debated from a navigator's point of view; the angle named in the resolution passed at the Washington Conference was in every sense a restrictive angle, whereas Sir Digby Murray's is a compulsory deviation.

2030. I think that your view rather is, is it not, that the half-point angle adopted by the Washington Conference was an error made at by the German Naval Delegate, owing to his doubling the angle which he professed to arrive at from a translation of an old English Board of Trade pamphlet?—Yes, there is no doubt about that. It is clear from the proceedings of the Conference that he doubled the angle. The crossing point that he named, viz., 10 times the beam of the vessel ahead, gives an angle of half a point as the *sum* of the two convergences, or the angle the most convergent port ray makes with the most convergent starboard ray; he doubled it by making *each* convergence half a point and the sum a whole point.

2031. In the past, when ships were smaller and slower, do you think that the importance of lights not crossing was so great as it is now?—I do not think that it was nearly as important in the old days of slower ships, carrying lights that only just complied with the law as to range.

2032. So that you think the importance of screening has increased in recent times, as ships have got bigger and faster?—Increased, yes, certainly.

2033. Before the Board of Trade Rule of 1892, do you think that practical seamen entirely understood what the angle of screening actually was?—I do not think they understood, or ever measured, or hardly ever, until quite lately, measured the angle of the most convergent ray at all. They screened the inner ray, the ray from the inner edge or the centre of the wick as nearly parallel as possible, and the ray from the outer edge converged and crossed so that the two lights showed ahead, and they thought that a sufficiently practical and proper interpretation of the Rule.

2034. I think that the old practice, in your view, was to have the line joining the inner edge of the wick and the outer edge of the chock parallel with the keel?—Yes.

2035. Your view would be, would it not, to give about one degree to two degrees convergence for the ray from the outer edge of the wick?—Yes, from one and a half to two degrees, according to the construction of the lamp and the width of the wick.

2036. You know it is said that there is a misprint in the paragraph of the Board of Trade Instructions of 1875, which directs screening from the inner edge of the wick, a misprint of *wick* for *lens*; but as the lamps were made, do you think there was any material difference between a screening from the inner edge of the lens and the inner edge of the wick?—I have been informed, I forget by whom, that Sir Digby Murray said that there was a misprint there, but in all the diagrams and the instructions to surveyors the two lines are practically identical (*i.e.*, the line joining the inner edge of the wick and outer edge of the chock cuts the inner edge of the lens), as far as the scale of the diagram will admit. I believe that in some lamps, constructed by careless or ignorant makers, the two lines would not be at all identical, but in the best lamps they are.

2037. In your view, what is about the maximum convergence ought to be allowed?—I think that is quite the maximum, and efforts ought to be directed towards reducing instead of increasing it, while maintaining efficiency.

2038. Would there be less objection to convergence with lights of low power than with those of longer range?—Yes; because the further the lights show, the greater the length of the chord of the sector in which both lights show. At 7 miles the chord of the sector with 4° convergence is a whole nautical mile across, and that is what the vessel might have to port. If she is about 4° on the starboard bow of another ship she has to go the whole nautical mile to starboard (to the right) to shut out the green light, as she is bound to do by law. If the lights are screened to an angle of only one degree, she has only to go a quarter of that distance. In the Red Sea, Mediterranean, &c., modern side lights are often visible seven miles, and sometimes even 12 miles.

2039. You will agree, in a certain sense, that uniformity of practice is desirable?—As far as possible, I think uniformity is most desirable.

2040. But you would not be prepared, I understand, to sacrifice to that uniformity what you consider the desirability of the lights not crossing?—The less the lights show across the bows, provided they can be seen ahead, the better for all purposes of navigation; and so I should rather sacrifice a little uniformity than sacrifice the other object and allow the lights to show across the bow.

2041. You feel a difficulty, do you not, in attaining absolute uniformity, having regard to the different illuminants in use?—There always must be some slight difficulty, more theoretical perhaps than practical, because of the difference in width of the wick.

2042. The electric side light, in your judgment, gives better results in this respect, does it not, than the more old-fashioned lamps?—Because the width of the wick is a factor that has to be taken into consideration. In all the electric side lights I have had—I have not seen a great many pairs of them—but all I have seen in my two last ships, not only my present ship, but on the previous one, the "Austral," if you look at the side lights from ahead, instead of there being breadth to them like others or width, it appears like a thin vertical line in the lens, and the moment the chock crosses that line the light is cut off.

2043. I think you were speaking just now of the difference between the effect of visibility at a greater distance and a less distance, because there is some difference in the result according to the power of the light employed?—I do not quite understand.

2044. I mean that according as you employ a more powerful or a less powerful light, if the rays cross, the greater the distance is to port or to starboard to which the area of double light is extended?—Yes, because the sector in which the lights are visible has a different length of chord; the chord of that sector increases in direct proportion with the distance. At 8 miles the chord would be double what it would be at 4 miles, or four times what it would be at 2 miles.

2045. In the case of lights of low power, I think you go so far as to say that you do not see any objection to the depth of the chock being increased rather than reduced, even if the full power of the light would not be seen ahead?—Personally, I do not see any objection at all, unless it is not in accordance with the International Rules, because if the light is visible—if that vessel's full light is visible at two miles there will be quite sufficient visibility at the crossing point, even with 1° convergence, to make that light perfectly well visible.

2046. There are places, are there not, for instance, the upper end of the Red Sea and the Mediterranean, where side lights of vessels are seen at considerable distances?—In places where the atmosphere is frequently very clear—clearer than it usually is about the coast of England—like the Mediterranean and the upper end of the Red Sea (and this is also emphasised sometimes by extraordinary refraction), I have seen the side lights of vessels as soon as they come above the horizon, 12 miles off. I have often seen some of our side lights and some of the side lights of the P. and O. and some other good lines going to the East 12 miles off. We have taken the time the lights have been first sighted and the time the vessel carrying them has passed us, and you can easily estimate the distance off when first seen.

2047. What lights are you referring to as seen at that great distance, oil lights or electric?—I believe both: electric, 12 miles; the best oil, 6 to 8 miles.

2048. I think you worked out a table showing the length of the chord of the sector in which both lights would be visible with 1° of convergence and 4° of convergence at distances of 2 to 12 miles?—Yes. The 4° chord is practically exactly four times the 1° chord, so that you have got to go four times the distance. If you are just on the starboard edge of the sector, you have to go four times the distance with a 4° convergence to shut out the green light—and you never know you are safe until you do that—you have to go four times the distance with a 4° of convergence that you do with 1°. Perhaps you have no sooner done it for the first vessel than you have to do it for the second, and no sooner for the second than you have to for the third, and you might go on doing that *ad infinitum* with a great number of lights coming up the Channel.

2049. You know it is said in answer to the objection you are urging that the rules are made for open sea and not for rivers and narrow navigation. What do you say about that?—I think it would be absolutely unworkable in practice to have two sets of rules. Who could say where one left off and the other began, and this question would have to be settled for every river which vessels navigate. It would be impossible, it would be absolutely unworkable. Besides, all the objections that I and others have urged against the 4° of convergence in places like the Thames and Mersey are equally applicable to the Downs and the English Channel, or any places where ships congregate together, such as the coast of Spain. You sometimes have as many vessels off the coasts of Spain and Portugal—at St. Vincent, for instance—as you do anywhere else, or off Tarifa.

2050. In crowded waters the effect is practically the same as in narrow waters?—Exactly, and there can be no possible reason for having two sets of rules.

2051. I think that you have a chart showing what the effect would be at a particular place, a place near Tarifa?—Yes, and this is only a typical example, and applies to hundreds of other places.

2052. I think there are some instances which you are able to mention in the course of your experience. There is one I think you mentioned in your article in the "Nautical Magazine" for June 1893. Will you tell us what that case was?—Well, that was the case of two steamers meeting in the Back Stairs Passage near Adelaide. In that article I did not mention their names, I do not mind mentioning them now. One was one of the Pacific Company's steamers, and the other was one of the French Messageries Company's mail steamers, and these two steamers met in the Back Stairs Passage. The French captain gave me an account of this himself, that he saw the English ship's green light and thinking that his green only would be visible from her bridge told the officer of the watch to starboard a little, to give her a little wider berth, than if they were passing port to port, and he went into the chart room. Immediately after that he heard his helm being put hard over, and when he went on the bridge to see what was the cause of it he found his own ship was turning round with her helm hard-a-starboard, and the English ship turning round with helm hard-a-port. He could not make out what was the cause of this extraordinary manœuvre, as he described it, on the part of the English vessel, until he found out on further examination that his own side lights were showing across, and that the English ship seeing his red side light across his bow had ported her helm. His helm was at the moment just a little to starboard, and it was too late to shift it a-port, and there was nothing to do but to ram it hard-a-starboard, and each ship made a complete circle, one to starboard and the other to port and then passed port to port

2053. Of course there was plenty of room, but do you think there would be danger in doing that manœuvre in narrow waters?—I think it would be most dangerous in the English Channel in narrow parts of it with lots of vessels about, or in *any* place where there is much shipping.

2054. I think you have been told by the captain of the French steamer that, in his judgment, at any rate, it arose from the red side light showing across?—Yes, and he told me a few years before one of the Messageries steamers had sunk another off Barcelona, and he believed it was because one of the red side lights was showing across the bow, and after this and what occurred in the Back Stairs Passage with one of our ships he wrote a very strong letter to the manager in Marseilles, pointing out the dangers that might be the result of screening side lights in that way, showing across the bows, as they were never intended to do.

2055. I think you are inclined to think, are you not, that something of that nature might have been the cause of the collision between the "Alvah" and the "Brinkburn" in the Straits of Messina?—I believe that was the cause of that collision; the two steamers were approaching one another on such courses as they would pass starboard to starboard.

2056. (*Sir F. Evans.*) At night time?—At night time. And the one that was coming from the northward, I think it was, took a sheer against her starboard helm not sufficient to show her red light, if it had been screened finely, as I contend it ought to have been, but as her lights were screened so that her red light showed across the bow, the other steamer, seeing it, immediately ported. Just as she ported, the first one, which had taken a sheer against her helm, began to answer her starboard helm, the two ships came into one another. I do not know which went down. One hit the other, and the one that was struck went to the bottom.

2057. (*Chairman.*) I think there was another collision in 1893 in the Thames between an English and a foreign steamer which you attribute to the English ship's red light showing across?—Yes, there was a collision off one of the docks in one of the upper reaches of the Thames. This English ship was going to dock, and the foreign steamer was coming down, and our senior Trinity House pilot told me that he heard from the piermaster they could see this English steamer's red light cross the bow, and although he signalled by whistle he was starboarding his helm, still the other steamer seeing his red light paid no attention to it, and ported his helm, and there was a collision. Luckily the ships had both very little way, and there was not much result from it.

2058. Well, not to go into more cases, I think there are other cases as well that you have heard of where this crossing of the lights has been a source of danger?—I am quite sure of it. I have seen so many steamers cross my own bows unnecessarily to begin with; not long ago, when this Rule first came out, one of our ships was leaving Plymouth, and one of the Pacific Company's line was approaching it on diametrically opposite courses in the dusk of evening, and they were approaching one another in such a position that they could pass starboard to starboard in daylight if they liked, but one steamer had just had her chocks pared away by the Board of Trade and her red light showed across her bow to the Pacific ship which then ported across her bow, fortunately, of course, there was a good look-out kept and no collision occurred. It was no fault of the officer of the watch, it was the way the side lights were fitted.

2059. Now, reverting for a moment to the Washington Conference, the rule they recommended was a restrictive one; it prescribed a limit which was not to be exceeded?—Yes.

2060. And you lay stress upon the fact that the Rule of the Board of Trade is an absolute Rule, viz., 4°?—The Washington Conference angle was a restrictive angle, and if they had had the benefit of the discussions that have lately taken place I think they would have restricted it very much more still. Sir Digby Murray's, on the contrary, is a compulsory deviation from parellelism exceeding the intended maximum of the Washington Conference by a degree and a quarter—1·2°.

2061. Now, what is the opinion (in your judgment) of the sea-going members of the nautical profession generally on this subject?—Well, I have talked this question over with a great many men in my own profession, a great many men in the navy, navigating officers in the navy in active service, and several of the Messageries' captains, and I have heard from our pilots the opinion of the German captains in the Atlantic service, and also in the North

*Capt. J. Fitz-G. Ruthven.*

15 May 1895.

German Lloyd steamers going to Australia, and I have never heard one. I think, yet that did not absolutely condemn the Rule, and I have letters in my possession from some of them saying so; condemning this angle of convergence in the most unqualified terms.

2062. I think you have heard as an argument against that view, that it is necessary in very hazy or foggy weather for both lights to be seen a short distance ahead in case of another vessel where only the most prompt action on the part of the officer on the watch can avert a collision; what do you say to that argument?—That was Sir Digby's Murray's argument to our deputation in support of it; but I say in a case like that it is too late to trust to side lights. You have not time to look whether there is one or two the best thing you can do if you get in such close proximity as about a third of a ship's length ahead is to go full speed astern, and the ship ought to be slowed down; that is the only thing you can do. I do not think that you would ever avert a collision if you were in such close quarters by means of side lights. In my ship it would be one third of the length ahead.

2063. As to the theory of dark lane which has been suggested, do you think that is a practical objection to fine screening?—No, I do not think it is any objection at all. I do not think you can produce a practical dark lane without diverging screening, and nobody yet that I know of has recommended that. With the fine screening I recommend, 1°, there would be no dark lane; I question if there would be one with even absolutely parallel screening.

2064. You are speaking of 1° from the outer edge, I presume, not 1° from the inner edge of the wick. The Board of Trade 4 is 4° from the outer edge of the wick?—Well, I say 1° from the centre of the wick. Most of my experiments and calculations have been made from my electric side lights, which have practically no breadth at all, and to make that conform as nearly as possible you cannot get absolute uniformity with so many different kinds of lamps and illuminants—I should take the centre of the wick. There is always a little light, too, from the outside of the lens, which in very close quarters would prevent a dark lane.

2065. I think it was pointed out to you, was it not, by the officials of the Board of Trade that some statistics showed that 4° of convergence was about the average of previous practice. What would you say to that suggestion?—Well, I got these statistics and dissected them for myself, and I found, whether by accident or design, that nearly all mail steamers and vessels of the best class, which would have powerful side lights, were left out of them. They were nearly all either cargo steamers or sailing vessels. In the Liverpool list, there were four Cunard steamers; they were the only ones that I could see that were mail steamers at all. In the London list there were a few more, but five of those in the London list had their lights screened parallel, and the others were from 1° to 3½°. The whole of our fleet and the Pacific Company's fleet, where the chocks had been pared away (I have this on the authority of our marine superintendent and Captain Conlan, Marine Superintendent to the Pacific Company) there was nothing said about them, There was nothing said about the P. and O. ships, (with a few exceptions in which the angle was less than 4°) which were altered previous to that measurement. I felt they were altered the wrong way, according to my argument. They were not altered to decrease the angle, they were altered to increase it.

2066. In your opinion there were whole fleets of steamers, of which yours was an example, where the angle of convergence was only about a degree?—Yes; I did not measure them all; I know they were all done on the same principle, and my own was a degree or a degree and a sixth exactly. I calculated it, to be accurate, from the shadow thrown by the side lights on the screen, the shadow of the chocks on the screen; then, when I actually measured the crossing points with the lead line in port afterwards, they agreed within 7 or 8 feet.

2067. You are speaking now of the electric light?—The electric light.

2068. I think you regard the question, as a practical rather than a theoretical one?—Yes.

2069. Now, I want you to tell us shortly the view you take of the regulation. The regulation says the side lights shall show from right ahead to two points abaft the beam, and not show across the bow. Do you think it reasonable to suppose that that should be interpreted to mean that the light should be shown immediately in front of the stem?—I think that a most unreasonable view, because if that were once admitted you could place the side lights in towers well forward where they would show three or four points across the bow, which would be an enormous infringement of the other regulation that the side lights shall not be seen across the bow.

2070. I gather that the reasonable interpretation in your view is that the phrase "right ahead" means ahead of the stem at such distance as will avert collision, and yet fulfil as nearly as possible the other condition of not showing across the bow?—Yes; I think that the only reasonable interpretation—makes the two views dovetail into one another.

2071. You will admit that there must be some limit of error to the angle of keel in practice?—There must be some limit of error.

2072. And do you think that limit might be put at 1°?—Yes, I think 1°, with electric side-lights, is as large a limit as ought to be allowed, but for the sake of uniformity—if it is considered that it is absolutely necessary to fulfil the law, that the full power of the side-light should show ahead—then we might allow a little more, as little more as possible, with side lights that have wicks.

2073. (*Captain Wilson Barker.*) That is to the centre of the wick, I suppose?

2074. (*Chairman.*) I think Captain Ruthven is speaking of all wicks in speaking of the centre of the wick?—I take the centre of the wick to correspond with the centre of the electric light, but as the electric light has no breadth practically, there would be slightly more convergence with the oil lamp which has a wick, and if the wicks were always thrown back at an angle of 45° instead of, as they are sometimes, at right angles it would subtend a smaller angle from any position ahead, and allow the side light full power on the side without making the converging angle so large across the bow as if the light was at right angles to the keel.

2075. Then, may I take it as a summary of your view that with oil lamps the convergence ought not to exceed 1° from the centre of the wick?—Yes, and for electric side lights too.

2076. And from electric light 1° from the light itself?—I think that would be the best solution of the difficulty, and that would be quite satisfactory to everybody who advocates fine screening and uniformity. I think that 1° of convergence is as much as ought to be allowed with the electric side light, which is the most powerful light, and that to assimilate that to steamers that burn oil, we might very well take the same convergence from the centre of the wick where oil lamps are used.

2077. (*Mr. Bolam.*) That is 1° from the centre of the flame?—Yes.

2078. I thought you said 2° to the Chairman?—No, 1°. That will make a little more convergence from the edge of the wick.

2079. (*Chairman.*) The outer edge of the wick?—Yes, when that question was first brought to notice by the action of the Board of Trade in their desire to increase the angle, I think the time was fast approaching when that angle would have had to be reduced in any case. I mean the broad screening, the irregular screening that was allowed, and sometimes broad angles. The American frigate brought forward at the Washington Conference as an extreme instance had a convergence of 1¾ points, about 20°.

2080. I should like to ask you this, as you have mentioned the centre of the wick; does it appear to you important, apart from the question of amount, which, of course, would vary, whether the point of screening be the centre of the wick in a case of oil lamps, or the outer edge of the wick; do you think it matters which you screen from?—It would make a slight difference.

2081. I know, but I was allowing for the necessary difference. But as a point from which to screen—apart from the question of angle of convergence—do you think it important to take the centre of the wick rather than, as the Board of Trade rule at present does, the outer edge of the wick?—The Board of Trade, as I understand, at present screens from the inner edge to the wick.

2082. No, from the outer?—They calculate the angle of convergence from the outer edge, and my proposal is that the line joining the centre of the wick and the edge of the chock shall make an angle of 1° with the plane of the keel.

2083. That is what I meant, the outer edge of the wick. You suggest, as I understand, that the angle should be calculated from the centre of the wick?—That is to

assimilate it as nearly as possible to the electric side light, and it would allow a little more convergence from the outer edge of the wick in oil lamps, and as oil lamps have not got quite the same range as the electric light, that slight extra convergence, I think, might probably not be harmful, and would tend to make the other condition fulfilled, of allowing more power to the light to show ahead; although, personally, I do not attach much importance to that—very much less than to the light showing across.

2084. Of course the objects, as I understand, of these side lights are mainly two: showing the course of the vessels and alterations in it, and also enabling the rule of the road to be carried out at night as well as in day light. Now do you think that those two objects are best attained by fine screening?—I think so; in my own mind I feel perfectly sure of it.

2085. I think, beyond this, you wish to offer a further suggestion, which goes rather beyond what we have been speaking of hitherto, as to a compulsory position for the side lights of steamers as regards the mast-head light of the vessel. Do you think it important that the place of side lights of the vessel should be determined?—It is not so important as the screening, but it is very important as indicating the course that a vessel is steering and the alterations in it. If you see a steamer steering across you not exactly at right angles but at an oblique angle, and you know that her side light is placed so that if she were broadside on the line from the mast-head light to it would make an angle of 45° to the vertical, the side light is in a first rate position for showing you any alteration in her course, not only the course she is steering, but you can see any alteration in her course. If it is placed at the same angle forward it will also indicate the alterations of the course; but in certain places last winter, like the Atlantic, where the ships had to dig their anchors out of the ice, I should say that would be a very bad place for the side lights. They might be covered with a coating of ice, or might be partially obscured by continuous showers of spray when the vessel is pitching even in ordinary temperatures, so I think further aft is a very much better position in that case for the side lights, and I would like to see them uniform. I should like all vessels to have them abaft; but beneath the mast-head light, (in the same vertical plane) I think, is one of the worst places in steamers whose foremast is very far forward; the forward position for the side lights is unattainable except by placing them undesirably near the stem and in some cases not even there.

2086. I think also you attach importance, do you not, to the consideration that as far as possible lamps should be subject to supervision as regards their construction and manufacture?——Yes.

2087. So as to insure as great uniformity as possible?—Yes.

2088. And you also think it desirable, as far as possible, that the force of the red and green lights should be equalized?—Yes, if it is possible. I cannot suggest a remedy; but if it is possible to devise one, I think it would be very desirable, because the red light is much better, and always has been, since the days of side lights, than the green. I think the power ought to be increased, the minimum power.

2089. If you like to say that, by all means do. I did not trouble you with it because that is rather a larger question. That would be very important as regards first-class steamers with electric light, and perhaps first-class lamps; but knowing what you do of the sea, and the nature of the great many vessels that traverse it, do you think a condition of that kind could be imposed?—It would not entail much more cost, and I think it would make very much for safety.

2090. In practice, I am afraid, even now, there are a great many vessels whose lamps by no means come up to the Board of Trade regulations?—Then they ought not to be passed. I thought the Board of Trade exercised sufficient supervision to look after that.

2091. (*Rear-Admiral Andoe.*) The side lights in your ship are lighted by electricity, I understand?—Yes.

2092. You do not object to the full power of your light being seen right ahead of your own ship?—Certainly not.

2093. You do not wish to cut off any of the power of your light from right ahead?—No, I would not like to cut off any of it.

2094. And yet you suggest it would be a good thing to cut off a considerable portion of the power or brilliancy of a side light which has an oil lamp?—Not a considerable portion of it. I would not object to a part of my own being cut off in the same way if it was cut off close to the ship with one degree of convergence. I do not care if three quarter power of mine were cut off by the chock *at a short distance* ahead of the ship.

2095. The old regulation required a line to be drawn parallel to the keel from the inner edge of the wick to the outer edge of the chock—taking that, and taking the breadth of the wick to be 2 inches, that gives an angle of something like 3°, although the screening is absolutely parallel in a line with the keel, do you realize that—what do you say to that?—If that is the case, I think it is too much, and might be reduced by angling the wick or adopting longer screens, or by both.

2096. It is actually a matter of calculation?—To begin with, I did not think that any wicks were quite so wide. I thought that about 1¾ inches was the widest wick, and in the widest wick the lamps are generally lit by illuminants which reduce it. I have not had very much experience of these lamps of late, because I have had the electric light; but there are some of the illuminants where the flame is wider than the wick; but I am informed that in the case where the wick is about 1¾ inch, the flame is really narrower than the wick.

2097. If you throw the chock out anything beyond the wick, of course you cut off a certain amount of light from ahead?—You would only cut it off at close quarters.

2098. If you put the chock in front of the wick I think you would?—Not in front of the whole of the wick—in front of the inner edge or in front of the inner half of it.

2099. The Board of Trade regulation was that none of the wick should be screened—I mean it implied that. That gives an angle of something very nearly 3°. Do you think that it has been realised by sailors, as a rule, that the light has always been thrown across the bow to a certain extent?—All seamen know that the lights have been seen ahead, that they must show a little across to be seen at a certain distance ahead of the ship.

2100. It is not many years since the chocks were placed; screens were fitted originally without the chocks, and parallel to the keel. In those days the angle must have been considerably greater than now, would not that have been the case?—Of course, if the screen was parallel with the keel, but I rather imagine, in those days, they allowed for there being no chock there, and made the screen slightly divergent.

2101. Can you state positively whether that was the case or not?—I cannot, because I have not any measurements.

2102. You only infer it?—I only infer it, and in those days there were very very few side lights that showed more than the regulation distance. These first side lights and perhaps rather rough screening supplanted no side lights at all, and my contention is that the improvement then introduced requires further development and accuracy to keep pace with modern requirements, just as we now steer to a degree instead of to half or a quarter of a point which used to be considered near enough.

2103. Now, from the point of view of a captain of a ship, when it is very often necessary to have the officer of the watch in charge of the ship at sea when in the track of steamers, as on the coast of Spain, for instance, and very often these officers are young and inexperienced, and some, perhaps, not very well educated, do you think it would be at all desirable to make any alteration in the lighting of the ship which would entail an alteration in that very simple rule, "Green to green, red to red: perfect safety, go ahead"?—I do not think it would; but I do not propose any such alteration; the gist of my suggestion is that the rule of the road shall be carried out at night time as in daylight; at present, ships which would pass one another starboard to starboard in daylight have to pass port to port at night time. Supposing there were only two ships, and one ship, when dusk comes on lights her lights before the other, they are then in different positions. If neither light their lights, they pass like that (*describing*), but if one of them switches on her electric light, that causes the other vessel to port, to pass to port, and *this* one wants to pass to starboard, seeing along the starboard side and no lights. I cannot see anything more likely to lead to a collision than that.

2104. Supposing that the lights did not cross, as they now do, with vessels passing one another, say red to red very nearly ahead of one another, and not seeing the opposite light, they therefore went on their course "red to red, perfect safety"—I do not say you would do it, but a young, inexperienced man with the rule of the road in his head might do it, and then there would be danger?—I

*Capt. J. Fitz-G. Ruthven.*

31 May 1895.

allow no inexperienced man in charge of my ship. I have only got very experienced men.

2105. I do not say you, of course. All ships that go to sea are not officered like yours. Ships' officers vary a great deal, and a great deal is necessarily left to the discretion of the officer, and when he sees one light only he says, I only see one light, I am going straight on, if anything happens I shall be all right; and so he acts accordingly, and gets very close to the other ship; whereas, if he sees the two lights, although rather on the bow, he knows perfectly well that both ships have to port their helm and go away from one another. Does it not appear to you that it would lead to what are called "close shaves" at sea?—No, I have seen no close shaves until this regulation came out in which the lights showed across, and immediately that came out, we found vessels which would have passed to starboard crossing our bows, and risking collision if we had not kept a good look out, so much so that I altered my chocks back again to what they were. I preferred to risk the displeasure of the Board of Trade than to run down a ship and to cause the loss of a number of lives.

2106. Have you heard it stated that a great many ships at Liverpool had to have the chocks increased because the angle was too coarse?—I never heard that.

2107. That they were too coarse, and they had to reduce the angle in a great many cases?—Well, I can quite believe that; that is what I did with mine after the Board of Trade surveyors cut the chocks.

2108. Therefore 4° was really less than the angle at which they were originally screened?—Do you mean when the Regulations came out they found they were screened too coarsely? Not that my side lights were screened too coarsely. That statement was made by one of the Board of Trade surveyors about one of our own ships. She was one of the ships which were examined in Liverpool, and when we went into it we found that the Board of Trade surveyor had altered the ship in London just before she went round to Liverpool. And it was a very extraordinary thing that when those statistics were prepared by Sir Digby Murray, there were hardly any mail steamers in them. I think in the Liverpool list there were four Cunarders, and one was 1°, another 1½°, another 2° or 3°, and another 2°, as well as I remember.

2109. Would you like to leave more to the discretion of the officer of the watch than is now properly left to him, or would you like what is called a rule of thumb left for his guidance; I am speaking now generally, not for experienced officers, but for seamen as a rule?—But I do not see how the finer screening would leave more to them. In each case the officer acts according to the lights he sees, the only difference being that with the broad screening he and the vessels going the other way are crossing one another's bows quite unnecessarily.

2110. We have diagrams before us here which show, if very fine screening were the rule, it would lead, if not to collisions, to very close shaving?—I have not seen them.

2111. (*Chairman.*) Do you regard vessels which are [*describing with models*] each fine on the other's starboard bow, as in a position of practical danger?—I have been in command of a ship for over 20 years, and I was a responsible officer for some years before that, and I have never, in my experience, seen a case where that would apply, where I thought there would be any danger. And if you put a case like that, I should not then stop here. An officer who will rub sides with another vessel passing starboard to starboard is just as likely to do the same thing on the other side if compelled to pass port to port.

2112 (*Rear-Admiral Andoe.*) Some of these tramps yaw a great deal, do they not, in their steering; have you noticed it?—I see them sometimes.

2113. It arises from bad steering?—Yes, from bad steering, I presume.

2114. Then in some cases it is very difficult to know what to do unless you can see both lights right ahead or nearly ahead?—If you see them like *that*, well, then, port; but it is very hard to have to do that for every vessel you come across in the Channel. You find one or two for which you have to do extraordinary things sometimes, if you come across a ship navigated like that.

2115. Does that not show that screening to a degree is rather unpractical, considering that ships yaw several degrees either way in steering?—I do not think so; on the contrary I think it a decided argument for fine screening when, if a vessel yaws and shows first red and then green, and so on, you can tell to a nicety how she is steering, and seeing her eccentricities give her a wide berth. I think the light showing at 4° across the bow would introduce a great risk of collision that was not there before, and it also may put vessels ashore when you are going up river. I gave a case on the chart *there*, to show how it might cause a stranding, and the same thing might happen going up a reach of the Thames. Here is some shoal water *here*. Now, these two ships would pass clear, but this green light shows across, and you do not know that it does; to make sure of being on her port bow you have to port more, and perhaps get into danger through it.

2116. But, then, coming up the Thames, ships are in charge of local pilots, who have local rules, and who understand each other, and know what each other will do?—I beg your pardon. As far as pilots are concerned, they conform to the rules as to side lights; and the Trinity House pilots were the first people to call my attention to the cutting away of the chocks and they objected as much as anybody to it. Our side lights were all right until this new rule came out and the surveyor cut away our chocks, and I have had mine altered twice or three times; and each time they were altered either way the difference was most marked in the way other vessels passed us, showing plainly the increased risk with the larger angle of convergence.

2117. Do you think it would be practicable always to place side lights well abaft the foremast so as to give a clear view right ahead?—Yes, they could always be placed so as to give a view. It will not do to put them in certain places and then put a boat in front of them. Of course the Board of Trade surveyor must look to that.

2118. Do you think it would be practicable to give such an order as that, that it could be carried out in practice?—Perhaps not immediately with uniformity; but it can very well be gradually brought about.

2119. Do you not think it would rather lead to disaster than otherwise, if you thought all ships were fitted in that way and dealt with them accordingly, and you found they were not so when you came up to them; would it not be misleading?—No, I do not think so, because seamen would know that the change was being brought about gradually. There are plenty of ships being fitted up now in that way, and we see they are fitted up in that way, and that the ship's side lights are abaft, and we can see the alterations in the course. There would be no more risk during the alteration than at present when the lights are in every conceivable position.

2120. Where are your side lights usually fitted?—Mine are abaft, but not quite so far abaft as they usually are, as the bridge of my ship is very far forward indeed—it is within 100 feet of the stem, and the ship is 500 feet long.

2121. Do you think they should be at all abaft the bridge? Would there not be a liability of there being a glare in the eye of the officer of the watch?—Of course you would have to provide against that. You must put them so that there would not be. My side lights are placed so that the plane passing through them and the mast-head light makes an angle of 42° or 43° with the vertical.

2122. (*Mr. Ismay.*) I think, perhaps, you may desire to explain. I believe that your bridge is quite exceptional in its position?—Oh, very exceptional indeed; the bridge is so forward.

2123. As a rule, the position of the bridge in most steamers would fulfil the conditions you want?—Yes, but the bridge in my ship is very far forward. A position can always be found for the lights at this angle, and so that they will not dazzle the officer of the watch.

2124. Of course you consider it a very undesirable thing, as a practical seaman, that there should be anything like a light or glare in the eyes of the officer of the watch?—Yes, and we cover our passenger lights when we get into narrow waters, I mean the lights on the promenade and upper decks in the neighbourhood of the side lights.

2125. What I take it is, you wish to increase the power of the lamps and reduce the angle, and by that means you get narrow screening with a longer range?—Yes; shortly stated, that is it. The fine screening is what I contend for, and uniformity is desirable; that screening would be equally effectual for small vessels; and for lamps of small power. The crossing that would be harmless in them would be very undesirable with lights of great power; and fine screening, I contend, would be equally good and perhaps better for the lights of smaller power too.

2126. You feel so strongly on the subject, I understand, that in spite of the Board of Trade Regulations you have decreased the angle?—I feel so strongly on the subject that I have altered my light screen back again. As fast as the

Board of Trade surveyors have cut the chocks away, I have put the pieces on again when I got away to sea, on the principle that I knew that I had plenty of lawyers as well as seamen of the same opinion as myself; and I thought that I would rather risk the displeasure of the Board of Trade than run the risk of running a ship down.

2127. Is that not misleading to ships who expect you are complying with the rule?—I do not think so.

2128. But they expect to find you screening to an angle of 4°?—It does not make any difference. They only get quicker across the sector than possibly they expected. Increasing the angle would be misleading to other vessels.

2129. Have you ever looked at your lights from your stem-head?—Yes, from the forecastle.

2130. Can you see both?—No; but by leaning a little over either bow you could see one or the other when screened to 4°.

2131. Have you been on board ships where you could see both?—I have not myself, because I get so much of my ship when she is at sea, I do not bother much about her when she is at home, or about any others. But our marine superintendent has seen some from the stem-head.

2132. It is so; as a matter of fact now, I think that you could?—Yes, from some.

2133. (*Captain Thomson.*) I suppose, in the evidence that you have given you have spoken from the point of view of a captain of a large ship?—Well, yes; I have given this evidence from my own point of view practically; but I do not think I have said a single thing that can be depreciatory to the side lights as far as other vessels are concerned in carrying out the Rules of the Road; and I have talked this subject over with men of all grades of my profession, and they are agreed on the subject—everyone that I have spoken to; nor can I see how the screening that is best for a large ship can be otherwise than good for a small one.

2134. There is one point to which I should like to call your attention. In the diagram, when you were describing the three lights of an approaching steamer ahead or a little on your starboard bow, at a distance of five to six miles, you said you had to port?—Yes, in *that* position [*describing*].

2135. Why should you port at that distance?—Because, if you see the three lights of the steamer, the rule of the road is that you should port. You cannot judge distance on a dark night. You see the three lights, and you want to shut one out as soon as possible, unless you are quite certain the distance is a long way off.

2136. If you meet a ship at sea five or six miles off, that vessel may not see you at all at that distance. Supposing you are in a small vessel?—I guarantee she will see my vessel if she has anybody looking out.

2137. But supposing you are in a small ship and not a mail steamer; take a little tramp, say, 80 feet long, and you see a vessel five or six miles off, that vessel would not port to you at all. She will keep on her course?—She ought to port and shut in the green light which, if there is no other danger in the way, is the usual practice as soon as the lights are seen.

2138. Now see what happens. The little tramp, taking you to be five or six miles apart, seeing you at that distance, will port to you, and he will be driven out of his course considerably, but you will keep on your course, and that is not keeping the rule of the road. The rule of the road is that both vessels shall port. Therefore you cannot take that rule to apply at a greater distance than two miles, because it is the legal range of the side lights. Another thing, if both vessels port is it not the case that they will deviate very little from their course?—If they both port? Well, they would not have to deviate very much. But still I put two vessels there, and I put a third one here, which does not come in, it is so very far off. My argument is the more the lights cross, the more you have to port. Supposing they are seen two miles apart, you have still to port when there would be no occasion to do it at all if the lights were screened to 1° instead of to 4°, and I can say safely I never had any trouble that way at all until the Board of Trade surveyor cut away my chocks, and then I altered them, after we had gone down Channel, and I altered them the next voyage, and again on the next voyage, and vessels running across our bow all the time and courting collision before I altered them back. Another thing, the legal range of side lights is not two miles, but *at least* two miles. It is quite impossible in practice to tell when lights are exactly two miles off, and even if it was possible it would be most undesirable to have to wait instead of letting the other vessel see your intention sooner.

*Capt. J. Fitz-G Ruthven.*

15 May 1893.

2139. Are you aware that if the screening is parallel with the keel, as has been advocated, the rule of the road with regard to meeting ships would be that you could not meet a ship end on or nearly end on at any time unless the stem of that vessel really cut between the side lights of the other vessel, are you aware that if parallel screening was carried out, the logical interpretation of the rules of the road would be, I think, as it was in the case of the Chili, that a vessel at night-time could not be considered end on, or nearly end on to an approaching and meeting vessel, unless the stem of that vessel actually cut between the side lights of the other vessel, or bisected what people call the dark lane?—Unless they were meeting stem to stem.

2140. Precisely?—I suppose that deduction could be made but I have never advocated absolutely parallel screening. There are two rules which we are trying to make dovetail the one into the other, and it is impossible that the light shall show ahead, and not show a certain degree across the bow, and that is why I recommend the small angle of convergence that will make the two rules dovetail into one another as nearly as possible, and which will interfere each with the other as slightly as possible. Make them to converge 4° to show a short distance ahead, and there is no saying *that* does not cross the bows, 4° is a material angle.

2141. I think you have called attention to the discrepancy between the rule of the road for daytime and for night-time?—Yes.

2142. That is to say, if one vessel should suddenly light her lanterns although it is daylight, or only just getting dusk, and she may see the other distinctly?—It is broad daylight at sunset when the law says the lights are to be exhibited.

2143. Now, in the daytime, meeting ships may have an angle of 4° with the fore and aft line of your ship, and be nearly ahead of you?—Yes.

2144. What angle would you call nearly ahead of you?—I should certainly not call 4°. 4° certainly does not come on the boundary. 2° might, it would depend upon how far you are off.

2145. Does the distance make any difference to my question? It is a question of direction, and not of distance?—It does in this way, as you said to me just now, you would not port for a vessel when she is 6 miles off, it does in a way, and it does not in a way. If I, at 7 miles off, saw a vessel in that position (*describing*) and she was 4° on the bow, I would not port my helm to go the other side of her, and I do not know that I would at two miles, not unless she was steering wildly and at night showing, or partially showing, her red light.

2146. Suppose half a mile?—Well then, I think I would rather starboard, the vessels would be near enough, unless I saw the other vessel port. Well, I should pass starboard to starboard in any other case, unless there were some peculiar circumstances, and the other vessel was doing what she ought not to do or I thought she was doing what she ought not to. She certainly could not port for me seeing only my green light, and my starboarding would only tend to draw me away from her.

2147. But do you not think, the other vessel being in this case at an angle of 4°, that she would have a reasonable cause to think you nearly ahead of her?—No, I do not think so, unless she saw both my side lights, as she would not if screened finely.

2148. You could not tell at what angle you would think she was really nearly ahead of you?—I think the distance makes a material difference, because you have got more time to pass her at a distance—and you can starboard and bring her another degree or two on the bow. I think the distance makes a material difference.

2149. You seem to have some difficulty in settling the angle in your mind?—Because I doubt whether it is possible at a long distance. I would be guided by circumstances, even at long distances. You can show the other vessel by starboarding a little (less the farther she is away) that you mean to keep on that side. I always endeavour to indicate to other vessels, as soon as practicable, what I intend to do. A much greater alteration of course and increase of distance would be necessary to cross her bow and get on her port side.

2150. Therefore a man might think himself nearly ahead of another up to—would you think 5°?—I do not think you would ever take five.

*Capt. J. Fitz-G. Ruthven.*

15 May 1895.

2151. It is an uncertain thing what nearly ahead means?—There is a certain amount of uncertainty, and it was introduced by the expression which, I believe, was brought in about the time I went to sea, "masts nearly in line." But I contend that 1° is about the same as "masts nearly in line." I brought that into one of the papers I wrote in the "Nautical Magazine." The rules of the road say you only port your helm in daylight when the other vessel's masts are in line or nearly in line. I say that 1° corresponds in my opinion to masts nearly in line, 2° might be doubtful. At 3° they are no longer nearly in line.

2152. In modern ships, where the masts are very far apart, or in cases where ships have no masts at all, you could not go by that rule?—No, and you could not measure the angle either. You would have to measure it by your eye, and act at once by your eye.

2153. I should like to ask you whether you think there is any difficulty in understanding the phrase used in the regulations for preventing collisions at sea, with regard to the fixing of the lamp. It says the lamps are to show a light from right ahead to two points abaft the beam, over a horizontal angle of 10 points?—Well, there is very little difficulty in fixing them.

2154. That is not my point. I want to know whether you think there is any ambiguity in that expression. Have you any difficulty in realising what that means?—There is a slight ambiguity, because right ahead may mean right ahead of the lamp, or it may mean right ahead of the stem of the ship. If I may refer you to what I put in this paper about that; it is better than I can express it off hand. I take a broad view of the regulations as a whole, which say that the side lights shall show from right ahead to two points abaft the beam, and not show across the bow. Even admitting that right ahead means ahead of the stem I think it quite unreasonable to suppose that this is to be interpreted, for instance, a foot in front of the stem, because then the side lights might show two, three, or four points across the bow, according to whereabouts on the side they were placed, and the model of the ship. The only reasonable interpretation is that it means ahead of the stem, at such a distance as will avert a collision and yet fulfil as nearly as possible the other condition of not showing across the bow. I contend that as there must be some limit of error to the angle with the keel, that limit may very well be put at 1°. By never letting the convergence exceed 1°, and by never letting the lights cross nearer the stem than 3 lengths or 30 beams of the vessel, the deviation from parallelism is so slight that the regulations will not be infringed, ships will pass one another at night as in daylight, and all the useful purposes for which side lights were originally adopted will be served. That is my view of these regulations.

2155. As I understand, you do think there is ambiguity in that phrase. It can be read both ways?—It can be read both ways, I presume, but I contend we must read it as it will best fulfil the regulations as a whole. The framers of the rule probably meant ahead of the lamp, but in another of the rules they infer that both lights will be seen ahead of the ship. My proposal leads to a minimum of deviation from both rules, besides being conducive to safe navigation.

2156. Can an angle of 10 points be more than an angle of 10 points, and cannot an angle of 10 points be limited by two lines of direction?—Most certainly it can, but I consider it most important that the forward limitation—the head limitation of that angle—should be most accurately fixed for safe navigation. An error of a few degrees in the limiting line abaft the beam will never bring about a collision. Still, it can be made as nearly correct as possible.

2157. With regard to that point, do you not think the case rather critical, where it is a question of whether a ship is an overtaking ship or a crossing ship on the starboard side?—I do not think so. There was a collision out on the Australian Station—I will not mention the names—the one ship said, "It is not my place to get out of the way," and the other ship said, "It is his place to keep out of my way," and so the collision happened, and the officers of both ships were condemned by court-marital. They were like *this* (*describing*).

2158. I do not think that was common sense if they were coming on like that?—If one had ported a little or the other starboarded or gone like *this* (*describing*) there would have been no collision.

2159. Was there not reason for their both thinking the other ought to give way?—That is what each said. There was a great conflict of evidence as to the course one or both ships were steering. Even a slight discrepancy makes all the difference, as to whether they were crossing or one of them overtaking, which made it, if there was any doubt, all the more necessary for both ships to act and sheer from one another.

2160. How do you suppose they could have known the truth of the matter?—Well, when they were getting too close together, if one had starboarded a little and the other had ported a little, there would have been no collision, and the finding of the court-martial was that they considered them both guilty.

2161. If it was the case exactly, of two vessels within the limiting condition and they both ought to give way, as a matter of fact could that not be settled by screening the side lights accurately to two points abaft the beam?—I do not think so, because to begin with it has been generally assumed that you are crossing if less than two points abaft the other vessel's beam and overtaking if more than two points, and you cannot find that in the rule of the road.

2162. It is not in the present rule of the road. Are you aware that it is in the proposed regulations for preventing collisions at sea?—Do you mean in the Washington Rules?

2163. Yes?—Well, I only glanced over that part of the Washington Rules; it is accepted sometimes, but it is not defined.

2164. The Chairman tells us that it is the law at present?—I have never been able to find it in the rule of the road. It is done generally. It may be law.

2165. Do you not think it necessary in that case to screen the side lights to two points abaft the beam?—Well, I do not mean to imply that it would not—that they ought not to be screened. I say screen them as near as you can, but I think that the line of the side lights ahead is immeasurably more important than that abaft the beam.

2166. (*Captain Castle.*) Vessels show a light over the stern?—Yes.

2167. (*Captain Thomson.*) You made some experiments* with electric light?—Yes, aboard my own vessel.

2168. What candle power?—32-candle power.

2169. You measured the angle by means of the shadow, I think, of the light against the chock?—The shadow of the chock on a flat screen that the light stands on. Supposing that is the fore and aft screen on its edge, there is the horizontal screen the lamp stands on, then you can rule a line along the edge of the shadow made by the chock on the flat screen, and then calculate the angle the line makes with the plane of the keel. I do not know whether an oil lamp would throw a sufficiently defined shadow; we carefully measured the angle of one side light and then the other on the other side, and found the crossing point ahead of the ship, and it agreed within 7 or 8 or 9 feet of the crossing point. I measured with the lead line, as I said before.

2170. You appear to me to have found fault with the rule of the road?—In what way?

2171. With regard to the difference between the rule for daylight and night-time?—I find no fault with the rule of the road. I find fault with the misconstruction. That does not allow the same interpretation and practice of the rule of the road at night as during daylight. I do not find fault with the rule of the road itself. I say that I want the same practice to obtain at night time as applies in day light, because otherwise it is deceptive and there is enormous risk to ships. Supposing you get a fleet of a dozen ships going that way, and a dozen ships going that way (*describing*), the law says that the lights shall be exhibited at sundown, but no two of those 24 ships exhibit their lights at exactly the same instant, and you have got a different rule applying, or a different method of applying it according to whether you see lights or not.

2172. (*Captain Hallett.*) With a view to what you said just now, about your being so very particular with regard to the line of crossing ahead, in preference to the line of crossing abaft the beam, does not that point in your mind to the necessity of laying down a certain direction for the wick to take in oil lamps?—It never occurred to me.

2173. With regard to the angle of crossing you may have a wick lying athwart ship, an inch and a half across, and another man may put his wick *that* way?—The point you speak about did not arise in my mind, but another thing did.

2174. The width of the wick is a great factor in the screening in the angle of convergence, and you say that factor should be reduced as little as possible?—I think it would be very advisable to throw the wick back, say, at an

* *See* Appendix 7, No. 1.

angle of 45°, so as to reduce the apparent width when looking at it from ahead.

2174*a*. To have some uniformity of position?—Yes, the wick ought to be in the centre, something like 45°; that could be fixed. The more it is thrown back to reduce the athwartship width the better.

2175. You are in favour of making a fixed position for the wick of all lamps so as to obtain uniformity?—Yes, and I see now how it is quite possible to get over the difficulties of uniformity of convergence to a great extent with single wicks of different widths, by setting the narrowest to, say, 45° to the keel, and the broader ones at smaller angles, so that they would all subtend the same angle at the crossing point ahead of the ship. This ought to be feasible if there was supervision in the construction of the lamps.

2176. With reference to the question put to you on the diagram, did you understand that that measurement, when you were illustrating it on the diagram with the models, would bring these two vessels within half a mile?—No, I did not.

2177. Because they must be in that position at half a mile, and for a mile they would be out of distance?—Then I would not carry an officer with me a second voyage who got into a position like that.

2178. Do you understand that the lights were not supposed to be visible, and that all the distances are not worked out more than half a mile?—That is a case where common sense and judgment are necessary.

2179. You could not be in that position within half a mile?—No. You have no business except in a fog to get there, to begin with, or only under very extraordinary circumstances indeed.

2180. (*Captain Barker.*) You said just now that in the tables of the Board of Trade about the screening of lights there were no mail steamers mentioned, giving the crossing of the angle?—I said there were very few.

2181. Perhaps you have not seen the report of the P. & O. Company?—No, I have not.

2182. That says that 80 per cent. of their vessels were screened to 4° or upwards?—Were not those measurements taken after the alteration?

2183. No, they were taken before—I imagine so—before the alteration?—I think not. In that report, if I am right, unless my memory very much misserves me, it mentions that the P. & O. were altered, and they gave that as a reason for not bringing any of them in. They were altered before any measurements were taken.

2184. The report is here if you would like to see it. [*A document was handed to the witness.*] I can certainly say that the two or three P. & O. captains I have talked to on the subject agree with me, and one of their most experienced captains, who is a friend of mine, agrees with me entirely in what I have said.

2185. We have here a summary* of the reports as to the angle of screening before the change. This is the report of the London district. It says "The majority of vessels were "screened to 4° or over. The old instruction was a rule "of thumb, and the result was dependent on the position "of the wick; in practice it was found the angle was an "angle of about 4°. From a return handed in by the "Marine Superintendent of the P. & O. Company it "appears that 80 per cent. of their vessels were screened to 4° or over"?—I think there is another list, this is not the one I have seen.

2186. Supposing the lights were screened so as not to show right ahead, do you think there would be any diffused rays showing across the bow at all?—I do not think there would be any from the light itself, but there might be a certain amount of light from the outside of the lens.

2187. That is what I mean, diffused light?—Yes.

2188. How far do you think that light would show?—Not a tenth part of the distance of the power of the light.

2189. Because many think if the lights were screened there would still be a lot of stray rays?—I would not go the length of screening the whole, I have not contended for that; but even then I do not think there would be enough to provide a dark lane.

2190. Do you not think the new rule may have made seamen a little nervous in navigating as they were under the impression that they were steering with the light screened parallel with the keel; do you not think that they got a little nervous?—Everybody thought the angle was increased, and as a matter of fact it was increased in whole fleets of ships to my certain knowledge. I do not think it made them nervous; I do not think that at all. Ships crossed our bow all the time, all through the alteration.

2191. What kind of electric light do you use in your side lights; is it the ordinary lamp that you use in the saloon?—Yes.

2192. Not a special light?—No.

2193. There is a certain width in that, it is about an inch wide?—No, it is not the way it is put in; when you stand forward of the light the light seems a thin vertical line.

2194. With the dioptric lenses?—Yes.

2195. With the fish globe lenses it would not be so?—Would it not?

2196. Not unless you get it right ahead with the dioptric lenses?—I do not know how that would be.

2197. The lamp is a 32-candle lamp?—Yes.

2198. Of course you are aware that in an electric light with the green light you get practically a white light?—I do not know whether you get a full green; we have a full green, I know that.

2199. With the electric green lights they have an orange colour at the back, do you know that?—I do not think so, not with ours.

2200. You will find probably, unless there is something to prevent it, that the electric light will kill all the green rays, and you will have a white light ahead of the ship, unless you have an orange light at the back?—Ours is a green light, and in passing our other ships at night their starboard lights have always looked green, possibly a shade paler than with oil.

2201. (*Captain Castle.*) That has been demonstrated in the P. and O. Company; they have peculiar electric lamps quite small. Are you aware that the London, Chatham, and Dover vessels are all screened to 4°?—No, I am not. Although they may have run clear they would have less difficulty in doing so if screened finer.

2202. And the South-Eastern boats 3½ to 4° and they are running across the path of ships going up and down the Channel?—Yes, I see here, in this list, a number of P. and O. ships, and it states that the angles were not measured till after the alteration.

2203. I suppose that is the most dangerous navigation you could have, across the Channel?—Yes, they cross the path of all the vessels going up and down the channel, but they meet few going the opposite way to themselves. With crossing vessels the convergence would be harmless if noticeable. It is in the case of meeting vessels that it is so mischievous and dangerous.

2204. (*Mr. Bolam.*) In the case of your steamer's side lights, you have reduced them to a physical line, practically as nearly as possible?—Yes.

2205. When you are compelled to screen from the outside, the effect of that would be that the whole force of your side light will be thrown the whole 4° across the opposite bow?—Now the whole force of it is thrown a degree and about 10 minutes of arc across the bow.

2206. That is after you put your chock on?—After I altered the chocks back as originally—I never measured them originally.

2207. I am asking you about the order. If your light is screened according to the new plan, each of your side lights will throw 10 points plus 4° of uniform, unbroken light?—Yes.

2208. And the same thing would be in every side light of the same kind?—Yes.

2209. And you would have a uniform and unbroken light thrown 10 points and 4° across the bow?—I would have a uniform and unbroken light from two points abaft the beam to 4° on the other bow, 116¼°.

2210. That rather seems to point to this; that to screen from the outside is a mistake, because it gives you no control over the uniform light, whereas if you screen from the inside you can have control, and get a uniform and unbroken light?—Yes.

2211. And you will be able to control the divergent rays?—Yes, with my electric side light there is no breath of wick at all; the inner and outer edge are the same.

2212. Quite so; supposing you screen 1° from the centre of illumination, you will be quite sure to cut off part of the

* *See* Appendix 2, No. 2.

*Capt. J. Fitz-G. Ruthven.*

15 May 1895.

light ahead—the uniform light, with broad wicks?—I do not quite follow.

2213. f you screen the light from the centre of the source to the edge of the chock, at an angle of 1°, then you will cut off some of the uniform light right ahead, where it has a broad wick?—Yes.

2214. Well, it would not be possible to do that under a rule of screening from the inside?—Well, it is absolutely impossible to carry out the existing regulations entirely as it is, so it is a question which is the least objectionable compromise.

2215. You think screening 1° from the centre of the source of light would be a correct thing in all ships and all lights?—I do.

2216. Both for electric lights and for wick lights?—I think it would be best for all classes of vessels.

2217. You, at any rate, would prefer to screen from the centre in preference to the outside?—Yes.

2218. Would you mind putting these two models end on and take the distance at 1,000 yards, say half a mile. *These* are end on—absolutely end on, therefore they are meeting, and therefore, of course, both port; put them a degree on each other's starboard bow?—There they are (*placing the models.*)

2219. Are they meeting or passing?—They are meeting.

2220. Now put them 2°, are they meeting or passing?—Meeting.

2221. Now put them 3°, are they meeting or passing?—Well, it is very hard to say where one rule begins and the other ends, but in practice I should call 2° as nearly as possible the dividing line between meeting and passing. It would be quite impossible at night to say whether a green light was 2° or 3° on the bow, and I should in either case starboard sufficiently to show the other vessel decidedly what I meant to do, unless he gave me the cue first by showing his red either designedly or accidentally.

2222. In fact there is a limiting case between meeting and passing which will never be got over?—It will never be got over.

2223. That must be always left to the intelligence of the officer on the bridge?—As matter of fact, it must be left to him.

2224. Put the models 1° on each other's starboard bow; there would be no difficulty in navigating with fine screening?—No.

2225. Now, put them 2° on each other's starboard bow; supposing you have a very fine screening, they will only see the green light *there*. What would they do?—They will only see the green light. They will be perfectly safe if they go on; you do not want the red as it is passing starboard side any more than port to port.

2226. Now put them 4° at, say, 1,000 yards. There again, they stand on both of them?—Certainly.

2227. Without altering their helm?—Yes, unless they thought they were going too fine or a little too close, when, of course, they would starboard.

2228. What I want to get is, whether 4° gives more angle of safety than the 2° angle of screening?—4°, I do not think it does, just the reverse.

2229. The point of the argument in favour of the 4° screening, as I understand it, is that green to green becomes perfect safety, go ahead. Then you can shut your eyes and do nothing?—Green to green. So it is with 2°, but you must keep your eyes open in either case.

2230. Is 4° better than 2°?—If you see any glint of the red light cross the bow, then you might port, but if you saw nothing but the green light, then I should say not. But this is a very different thing from porting for every vessel you see coming up Channel.

2231. If the two vessels were approaching half a mile apart seen 4° on each other's bow, and the screening was 4°, and they went on, two vessels of 60 feet beam would just clear each other's side at 119 feet, that is two beams. Would that be safety?—Two beams; they would not collide at that, and the same would hold good if passing port to port.

2232. At sea?—They would not in the open sea attempt to pass so close, and each would starboard.

2233. Would that be perfect safety?—No; but you get over that difficulty easily. It is only a mole hill; you get mountains by the broad angle of screening. They would see before they got close, and starboard a little more. I say these vessels would pass 365 feet apart* if they went on, but that would be most imprudently close, even in daylight, in the open sea. This is a case where the seaman's eye, instinct, practice, and experience come in, which no amount of convergence or theory can supplant. There is less risk of passing too close starboard to starboard than the other side, because it is the general practice of seamen to give a wider berth when passing starboard to starboard so as to leave no room for doubt in the mind of the officer in charge of the other vessel.

2934. What I want to get is, whether the instructions for screening at 4°, as compared with the instructions at 2° from the outside, gives any more absolute safety at those angles and makes the rhyme "green to green and red to red, perfect safety, go ahead," any more certain in the one case than in the other?—I do not want to make the rhyme right. I want to take care of the ships.

2235. You would rather sacrifice the rhyme?—Yes.

2236. Do vessels yaw a good deal in steering, especially cargo vessels and sailing ships?—Yes.

2237. With vessels steering in that way, is the 4° any greater safety than the 2° would be?—No, and 1° would be safer still.

2238. Even from those two points of view, from the point of view of the angle of screening, and from the other point of view of yawing, in the way of safety 4° would not be better than 2°?—No.

2239. Is there any advantage at sea at all, in point of fact, with a large angle of screening?—None whatever. The man that carries out the rules of the road so like an automaton as to rub sides with the fine screening will do the same with the 4° angle, which has all the navigational disadvantages I have enumerated. I have never heard but one argument in its favour, and that was Sir Digby Murray's own opinion; and he told us when we went to see him in deputation that if two vessels were approaching one another in foggy or hazy weather, and that if they could not see both side lights, there would be a risk of collision. Well, I say if they got as close as that the side-lights will not avoid collision. There is nothing but full speed astern.

2240. Have you a statement in your notes of the method in which you arrived at the conclusion that at the Washington Conference they inadvertently doubled the angle?—Taking the whole angle between the lights instead of the half angle. It is not in my notes, but it is in the "Nautical Magazine." There is no possible doubt about that. It is in the "Nautical Magazine" for March 1893, at page 208. This is the passage,—"It is rather amusing, if not instructive, to read the account given by Captain Mensing, of the German Navy, of how they came to adopt the half-point angle in the amendment they proposed. After stating that there were only two countries where the principle of the lights crossing is accepted, Denmark and Great Britain, he goes on to quote from a French translation of an English Board of Trade table, where it says 'that for the beam of a ship 20 feet broad, the 'shortest distance at which these rays should cross each 'other is about 200 feet, that is to say the rule laid down 'by the Board of Trade comes practically to this, that at 'the distance of 10 beams, or 10 times the breadth of 'beam, there should be a distance before which these 'rays of the side lights should not cross. That makes a 'half-a-point.' This is the angle under these conditions the the rays from the starboard side would make with those from the port. He at once proceeds to double it by reckoning it from the prolongation of the keel or axis of the ship. This error perpetrated by Captain Mensing escaped notice, was actually copied back into the British resolution which supplanted the German amendment, and voted for and against as if the angle had never been mutilated, while those who voted against, especially the Americans, no doubt did so, on principle, independent of the magnitude of the angle. I think it highly probable that some of those who voted for it did so, because they thought it in accordance with the rules formulated after long and extensive experience by the English Board of Trade. This proves that Sir Digby Murray's present angle of 4° is 1° greater than the maximum angle in the old Board of Trade regulations, and yet he wishes us to believe in the face of this and all the cutting away of chocks, that side lights are screened now at a finer angle than ever they were before."

2241–2. When the debate began at the Washington Conference the original motion was to amend the rule and prescribe that side lights should be fitted with inboard screens, and so on, so as to prevent these lights being seen across the bow within 100 metres ahead of the ship, and it

* *See* Appendix 7, No. 2.

was later that the proposal was made that the lights should cross at an angle not exceeding half a point?—I have forgotten that.

2243. That is the first resolution, and then it was seen that was not a good way of screening, and they proposed a resolution to deal with a crossing at a certain angle?—Yes.

2244. The resolution was in these words: "Side lights "should be so screened as to prevent the most convergent "rays of the light being seen more than half a point across "the bow"?—Yes.

2245. Do you know at all what beam the committee were thinking of when they suggested half a point?—No. As I have said, I read the proceedings themselves, and in the account given by the German Naval delegate, Captain Mensing, which I have already quoted, it struck me as extraordinary if the dimensions he named could give the result that he claimed, and I went into the calculation and found that he had doubled the angle.

2246. What do you say is the average beam of vessels?—My ship is 54 feet beam, and I suppose some of the big Atlantic liners are 60 feet and more.

2247. I have taken the average beam which you have given in your paper, about 32 feet?—I have given a few examples in that paper in the "Nautical Magazine." Two are large steamers, with their lights placed differently, one a sailing ship, the celebrated "Thermopylæ," and two schooners of the same length, but with different beams.

2248. In the Board of Trade experiments they have taken 30 feet as if that were a fair average?—Yes.

2249. I want to know if you noticed this: the first resolution which appears at Washington is that the outside rays should cross 100 metres ahead of the ship?—Yes. *Capt. J. Fitz-G. Ruthven.* 15 May 1895.

2250. If you take a vessel about 32 feet beam, I want to know if you have ever noticed that that makes each side light cross one-quarter of a point?—Crossing how far ahead of the ship?

2251. 100 metres. If you take a ship of 32 feet beam, and make the lights cross 100 metres ahead of each side light, the outer rays will be crossing exactly one-quarter of a point. If the second proposal were based on the first set that would seem to show it was a quarter of a point of each side light that was meant, and not half a point. I do not know whether you have worked that out?—No, I took it from Captain Mensing's account. There can be no possibility of doubt that Captain Mensing made this blunder quite inadvertently, and nobody saw it. If you take his own words you will see that is so.

2252. And that confirms your view?—Yes.

2253. (*Mr. Scrutton.*) If you are approaching a vessel at sea and see both lights, is it a rule that you port?—Both side lights, most certainly.

2254. Even if you are satisfied that the vessel is a little on the starboard bow?—Yes.

2255. If both lights are seen distinctly, you port, even though you may know that the vessel is a little on your starboard bow?—Yes, because, as I understand the rule of the road, if he did anything else and anything happened he would be held liable and have to answer for it.

## Thursday, 16th May 1895.

PRESENT:

THE RIGHT HON. SIR FRANCIS H. JEUNE IN THE CHAIR.

Rear-Admiral ANDOE.
Captain WILSON BARKER.
Mr. BOLAM.
Captain CASTLE.
Sir FRANCIS EVANS.
Sir EDWARD HARLAND.
Captain HALLETT.
Mr. ISMAY.
Mr. SCRUTTON.
Captain THOMSON.

Mr. C. HIPWOOD, *Secretary.*

Captain MATTHEW PEDDEN WEBSTER called and examined. *Capt. M. P. Webster.* 16 May 1895.

2256. (*Chairman.*) Captain Webster, I think you have been in command of both sailing and steam ships, have you not?—I have.

2257. Will you kindly tell the Committee what your experience is; how long have you been in command of vessels?—I have been in command of large sailing, ships, but principally steamships, for 28 years.

2258. I think you have been connected with Sir Donald Currie's Line, the Castle Line?—Yes, for the last 23 years.

2259. Have you been in command of any of those vessels?—Yes, nearly all of them.

2260. Has your experience extended to vessels of various sizes?—Yes.

2261. What sort of limits of tonnage?—In sailing ships from 1,200 up to 1,500 tons, and in steamers from 2,000 up to 5,500.

2262. Of course the breadth of beam of those vessels you have been in command of, or have had to do with, varies a great deal?—Undoubtedly.

2263. What are the limits of variation of the vessels you refer to, as to the breadth of beam?—From about 32 up to 52 feet roughly in steamers; there is less beam in sailing ships.

2264. Before the Board of Trade rule as to screening to 4° came into force, what was the angle in practice, so far as your experience goes, to which the lights of vessels were actually screened?—Well, my experience has been rather different from what has been said by the Board of Trade. My experience for the last 23 years has been that the lights have been screened in the line of the keel.

2265. You mean screened to the line of keel?—To the line of keel.

2266. Do you mean the inner side of the glass, or the inner side of the wick?—I should say the inner side of the wick.

2267. Had that been the case with vessels with which you were connected in the years before 1892?—It had. As a matter of fact, the Board of Trade surveyors reported that the whole of our ships were screened in the line of keel, and I was rather astonished that they should pick out one company and say that 80 per cent. of the Peninsular and Oriental Company's ships were screened at a large angle and not give the other side of the question, because undoubtedly the surveyors reported the Castle Company's ships to be all screened on the line of keel.

2268. So that in point of fact, in the case of those vessels, in consequence of the Board of Trade regulations the chocks have had to be cut down?—They have been altered, yes.

2269. Before the regulations came into force, what is your view as to what the state of things was. Did you think in point of fact that the side-lights of vessels did cross much, or that they did not?—In my experience at sea I certainly have met vessels where evidently the lights were crossing before. I have been at sea this year, and I think decidedly that has increased.

2270. Now I should like to ask you what your opinion about the Board of Trade rule of 4° is. Do you think its effect has been good or bad?—Well, I think that the effect of screening the lights at an angle of 4° in theory and science may be very well, but in practice you

*Capt. M. P. Webster.*

16 May 1895.

not only see the light at an angle of 4°, but you frequently see it up to 10° or 12°. It may be diffused light or reflected light, but that does not much matter with a seaman on the bridge as long as he sees a light; you undoubtedly are seeing those lights at a great angle. Now, I suppose that everyone is agreed that the object of the side-lights is that one ship may indicate to another the direction she is steering in. It is obvious to my mind that if you cross the lights at all,—we will suppose they are only seen 4° each side, that is an arc of 8°—you are diminishing the efficiency of that light to tell the way the ship is steering.

2271. So that in your opinion may I take it the lights ought to be screened as fine as possible?—Yes. I would rather, if there is such a thing, have a little dark lane, because ships do not travel on rails, they are constantly moving a little, so if there is a dark lane it would not last many seconds.

2272. Of course you know the international regulations enjoin an unbroken and uniform light over an arc of 10 points. Do you attach importance to a full and unbroken uniform light being shown ahead of the ship?—I do not quite follow your question, sir. The uniform light—I would like it to be seen as near as possible ahead, but I do not want it to go across, because my experience of the lights crossing is that you see diffused light, or you see the light a good deal more than the 4°. Therefore, I think the lights screened on the line of keel was a safer and a better principle.

2273. Can you tell us in this way. I daresay you have recognised that if an unbroken and uniform light, that is to say, a full light, is to be shown over 10 points of the compass, that it is absolutely necessary that there should be some crossing of the outside or converging rays of light?—Yes.

2274. Is it your view that that crossing should be made as slight as possible?—As slight as possible.

2275. What I understand you to say is, that if necessary you would rather sacrifice some part of the completeness of the uniform light ahead than have a great degree of crossing?—Exactly so.

2276. I should like you, if you will, to explain to the Committee what your reason is for thinking that the crossing of the light is a disadvantage?—Simply because as I said before whatever the arc is of your crossing lights—if you cut it off exactly at 4° that makes 8° altogether—it is impossible for a seaman on the bridge of a steamer to know within that arc how the vessel is steering. The vessel might be going *that* way, or *that* way, or *that* way [*describing*]. You cannot tell within the radius of that arc, whatever the crossing is, which way the vessel is going.

2277. As to the importance of a fine screening, do you think it applies most in the open sea or in narrow channels?—I think if the screen is adapted for showing across the bow that would be more dangerous in waters where there is a large amount of navigation than the open sea, certainly.

2278. As to the mode of screening, you know the rule of the Board of Trade is that the 4° should be reckoned from the outside the wick. Have you formed any opinion as to whether it is best to screen in relation to the outside the wick, to the middle of the wick, or to the inside of the wick?—No, I have not. I have only gone into the practical part of it in looking at the lights. I have read all the papers, but I have not paid the slightest attention to the scientific part of it at all.

2279. It is suggested on the other side, as against fine screening, that great importance is to be attached to the rule of the road, "green to green, red to red, perfect safety go ahead" And on that subject the suggestion of the Board of Trade is that if you get the screening very fine indeed, you might have vessels very fine on each other's starboard bow, and these vessels, if both kept their courses would come into collision. And it is said that under those circumstances, both the vessels being green to green, that there is not perfect safety if the screening is very fine?— Theoretically that may be correct, but in practice I do not think it is possible. We have great trouble with having poor lights on ships at times. There is no doubt about that. I do not mean in the ships I have been in. I have been in mail boats for a long time where we use electric lights, but we meet vessels with very poor lights, and I do not think you could screen the light so that two of them could come together starboard to starboard without seeing the lights in plenty of time, in practice.

2280. Supposing you saw the green light 2°, I will say, or perhaps 3°, upon your starboard bow, what would you do? A green, and only a green light 3° on your starboard bow?—I would, of course, starboard.

2281. You would starboard?—Certainly.

2282. You would think that that was a case in which it would be right, although green to green, according to the rule, is perfect safety?—Yes, but I would starboard on the principle that 2° is rather too close. I would go away a little bit.

2283. You would regard that as a matter of good seamanship, apart from the question of rules?—Certainly as a matter of good seamanship, because, if after closely watching the green light for, say, 20 seconds, I saw nothing but the green light, I would be justified in considering this a crossing ship, my contention being that it would be impossible for any ship to sail on a directly parallel course for 20 seconds, even with finely screened lights, without my seeing her red light, but taking into consideration that the angle at which the other ship was crossing *might* be very small, I say I would starboard a little, not only that by so doing I would pass the other ship at a more comfortable distance, but also to make certain that I would not show my own red light (by bad steering) to the other ship. I venture to say this is not in opposition to any "rule of the road." I think you should never go too close to a ship; when you see a light, or anything else, keep away from her. Do not shave too fine.

2284. So that you would not regard that as a position of practical danger?—No, but with 1° or 2° I would certainly say starboard a little and get a few degrees more.

2285. And I suppose you would carry that to 3° or 4° or as much as half a point, supposing she was half a point off?—In various waters half a point with a green light, you would keep on your course.

2286. But a quarter of a point; I suppose, that would be a case for a touch of the starboard helm, would it not?—Yes, I would feel inclined to do so, that is provided the navigation allowed my doing so.

2287. I think you have said that what is called the "dark lane" is not a matter which appears to you to be of practical importance, even if theoretically there should be some such occurrence?—That is so, from the fact that in the very finest steering ships, and I have been in very fine steering ships, you cannot keep many seconds in a degree the ship must move.

2288. What is the variation in a well steered ship?—Well, the variation is certainly a couple of degrees steering in the very finest way you can.

2289. Each way?—Yes, but I must say I have made a voyage where we have steered day after day, making 380 miles a day, probably 2,000 or 3,000 miles, and the course has not varied 1°. But that is in the gross. Still the ship would be moving a little in that each way.

2290. Of course, that is very good steering indeed?—Very good steering. It is only on a long course you could do it, and with very fine compasses and good steerers.

2291. Taking the ordinary ocean-going steamer, a steamer of the tramp class, what is the sort of variation?—The variation would be half a point certainly.

2292. (*Rear-Admiral Andoe.*) From the view of the captain of a steamer in the open sea where the shipping is rather thick, like on the coast of Portugal for instance, and having also in view that the ship must necessarily at times be in charge of an officer of the watch who may be young and inexperienced—possibly he may be well educated, although the officers of many of these tramps are probably not so—supposing, as you said just now, you saw a ship on your starboard bow 2°, you would starboard your helm?—A ship on my starboard bow—a green light I understood.

2293. A green light on your starboard bow?—Yes, I would move the helm, alter it a little to widen the distance.

2294. But supposing you were a tramp steering half a point or a point either way, and you showed both your lights at one time owing to a yaw to the ship approaching you, would not that vessel whilst you were starboarding your helm naturally port her helm to keep clear of you, seeing both your lights?—Yes, certainly, but I would also see her red light, and of course port.

2295. While you were going away on the starboard helm she would be going away on the port helm and that might possibly lead you into collision?—Yes, but I was not asked that question. I was asked what I would do if I simply saw a starboard light, if my starboard light was to his starboard light; and that is a very good illustration of my objection to the light crossing the bows, because I take it that if they were steering parallel courses, if they were passing ships, 2° on each other's bow, you would see both lights in both cases.

2296. Then you would both port your helm according to the rule of the road?—Well, according to the present rule of the road, and that I maintain is one of the dangers of lights showing across the bow. You might see both lights 4° and with diffused light 10° or 12° on the bow, and still you would be passing ships going parallel courses. You both port; if you happened to be rather close you would come into collision.

2297. In the case I pointed out just now, you would be giving starboard helm, the other vessel would be going port helm, going straight for one another; you would not be able to get out of one another's way?—Yes; but the case put to me was this: I see a green light, no other light, and I was asked what I would do, and I said as a matter of prudence I would widen the lights a little. There was nothing said to me about both lights.

2298. No, but if the other ship caught sight of both your lights at one time and went away on the port helm?—Well, if I only saw the green light——

2299. I merely point out that in the case where too much is left to the discretion of the officer of the watch collisions of this sort might occur from that cause?—Yes.

2300. (*Chairman.*) I suppose, you would say that if your lights were screened fine she would not see both?—Quite so. If she was 2° on my bow, and we were steering parallel courses, she would not see my red light if I starboarded a little—only seeing her green light I would not think it possible for her to be steering a parallel course.

2301. (*Rear-Admiral Andoe.*) But I presume that you are yawing, an ocean-tramp yawing?—If I were yawing it would mean that I would bring her green light on my port bow, and she would probably be doing the same, and according to the rule of the road (2° is practically end on) we would then both port our helms.

2302. I am also supposing that the vessel approaching is a mail steamer, steering a steady course, showing her green light?—Yes.

2303. You, the mail steamer, only show the green light to the tramp, and you see both of his lights, red and green, and port your helm, and run him down?—Yes. Well, there is a possibility of that; but my instructions to my officers on a mail steamer have always been these: There are not many ships that can go faster than you can, and you can turn right round, but do not go near any tramps at all if you can help it.

2304. You say you do not attach great importance to the full light being thrown right ahead. I do not mean ahead of the ship, but we will say ahead of the lamp. You do not attach as much importance to it being seen full ahead as you do on the bow?—No, I do not mean that. I do attach importance to the light being thrown ahead, but it should not go across the bow.

2305. Then you consider that it is as necessary that the light should show as brilliantly right ahead of the ship as anywhere on the bow?—As near as possible. I mean, of course, that scientifically it is probably an impossibility to make a lamp screened fine show as strong a light right at the end of the screen as it does anywhere else.

2306. You would not like the chocks of your screen to overlap any part of the wick in your lamp, so as to partly screen it from ahead?—I would rather do that than have the light across the bow. If it is an impossibility to get the whole of the wick of the lamp exposed without throwing the light across the bow I would rather cut off a piece of the wick.

2307. Is it not one of the most critical positions with ships passing one another, when they are nearly end on or within a point or so of each other?—Certainly.

2308. When you see the lights at night fine on the bow?—Yes, undoubtedly. I do not know about being critical, but it is one of the positions where you require to take very sharp action.

2309. In yawing first one light is seen and then the other, by which the officer in charge of the deck is left in doubt as to what course the approaching ship is really steering. That is entirely through yawing. What do you think of that?—Well, the officer of the ship that sees that ought to put the question beyond doubt, if he is in open water going up or down the coast of Portugal, for instance, by putting his helm over and bringing the light a couple of points out on his bow; two or three points.

2310. With a port helm?—It would depend on circumstances.

2311. Suppose he first sees one light and then the other?—If it is nearly ahead port his helm.

2312. Nearly ahead?—Yes.

2313. Previous to these new regulations, previous to this question being raised, did you fully realise the fact that the rays of all side-lights crossed?—I realised this, that I have never been able to discover a dark lane.

2314. Supposing it were fully proved that the screens of the side-lights of vessels have always been fitted so that the rays did cross the bow at a certain angle, say, 4° or thereabouts, would you be in favour of altering this old practice and substituting very fine screening without knowing what the consequences might be?—Well, you are putting a supposition to me, "suppose it was fully proved."

2315. Supposing it were proved, I do not say whether it will be or not, but supposing it were proved by evidence before us?—Well, yes, I would. I would be in favour of it.

2316. You would be in favour of altering the rule?—Certainly I would; but I do not for a moment think that it is possible that it can be proved.

2317. Supposing that the regulations were altered so that the lights should not cross the bow of the ship at all, and consequently that two steamers approaching one another very nearly end on would see each other's green light only, do you realise that they would pass, or possibly pass, exceedingly close to one another?—Certainly not, if they were both steamers.

2318. If they carried out the literal rule of the road?—If both steamers could see the green light only, and carried out the literal rule of the road and starboarded, they could not go near each other.

2319. Suppsoing you had an officer of the watch in charge of the ship, a young and inexperienced man, who said that the rule was, "Green to green, perfect safety, go adead," and thought there was no harm in giving a close shave as long as he was on the right side?—But we do not recognise inexperienced young men. The Board of Trade give them all certificates.

2320. Not in your company, but I suppose you may have tramps that you are glad to keep out of the way of altogether?—Yes, but the officers pass all the same examinations.

2321. Would you like tramps to give you a close shave?—I take good care they do not, I can go faster than the tramps.

2322. Do you think it would be desirable and conducive to safety that the side-lights should be fitted to so fine an angle that it would entail the cancelling of the present rule?—Of the Order in Council?

2323. Yes?—I certainly do; the 4° business, I certainly do.

2324. "Green to green, red to red, perfect safety go ahead"?—Not at all. I thought you meant the last Order in Council where the 4° angle was brought in.

2325. Would you like to see the permanent rule that you put into the hands of every young seaman and which he knows by heart, would you like to see that cancelled and a great deal more left to his discretion, in passing ships?—I think it is a great pity it was ever put into rhyme. I imagine a man before he becomes the officer of a ship ought to know enough of his business not to require a rhyme to remind him, but the practical part of the thing has worked admirably, and I would not alter any of these rules.

2326. Do you think it is firmly impressed upon the minds of the young seamen?—Undoubtedly it ought to be so; before a man becomes second officer of a steamer, he must have been eight or ten years at sea.

2327. By doing away with this rule you leave a great deal more to the discretion of the officer?—Yes, but I

*Capt. M. P. Webster.*

16 May 1895.

think the rule has answered admirably and you must have a rule of the road at sea, and you must have one that will be practically international. All I want to do away with is the rhyme.

2328. In fine screening, it would necessarily lead in many cases to close shaves unless the officer in charge of each ship uses discretion and judgment?—That is just the point I do not see; I do not agree with it.

2329. You think not?—I do not agree that fine screening would necessitate that at all.

2330. If you see a light 2° on your bow, you would either go straight ahead on your course or give starboard helm if it was the green light, and go away from it?—That is the present rule of the road.

2331. The rhyme is "Green to green, perfect safety go ahead"?—I think that is not so, if you will read the rule, that it is simply prudent even with green to green to keep clear.

2332. I am thinking now of the officers in charge of these tramps?—Of course, that is a very good point, but the officers in charge of these tramps ought to be as competent as officers in charge of the bridge of a mail boat.

2333. Ought to be so; do you think they are?—In many cases they are.

2334. Then why are you so anxious to keep away from them when you come across them?—Because in many cases they are not.

2335. Not what; not to be trusted?—Well, the fact of the matter is this, and probably it is rather beside the question, but the fact of the matter is that it is not the competency of the officers on those tramps, but it is that they are overworked and undermanned, and perhaps the poor officer is not on the bridge at all; perhaps he is down pulling a rope, or doing something else.

2336. (*Chairman.*) It is a question of look-out, very often?—Very often. Perhaps that is the reason of my keeping clear of the tramps. I do not say a word as to the officers; I only know they are overworked.

2337. (*Mr. Ismay.*) Do I understand you have been an officer since the new regulations?—Yes.

2338. And from your own observation have you seen any change in the lights?—Very marked. I ought to qualify that by saying that when the new rule came in force I was on shore. I paid a little attention to what was going on, and then I went afloat again; and probably I devoted a good deal more attention than I formerly did to notice the angle that I could see the lights at in different ships. In January of this year I was coming up the English Channel, and there was a very marked case of it. It was a hazy night. I was in a large ship, the lights were seen well enough. We were going along pretty well. I was on the bridge, standing not at the steering compass but at the standard compass in front of it, and there was a masthead and a red light reported on my starboard bow, and I took the glasses and looked. I saw it and said to the man, "port," and before the ship had answered her helm, the red light crossed the bow, and I took a bearing of that light, it was then some 7° on my bow, and of the visibility of the red light I had seen at first. Suddenly the green light loomed up. I was just in time to say, "starboard, starboard," and we passed very close. I think if I had continued to port we would probably have had a collision. Do you follow me? The red light I saw at a greater distance through the haze than the green light, and undoubtedly that ship was going a parallel course. I saw the red light. I took the bearing from the standard compass, and undoubtedly saw it 10° or 12° across the bow.

2339. And you would rather run the risk that might arise in the case put by the Admiral than such risk as this?—Certainly.

2340. And of course while theoretically it may be right to keep on, as a practical seaman you would naturally starboard when you see a green light?—Yes. In all those experiments with the lights, and I see some nice plans there, the fact is you are dealing scientifically with the thing. It does not apply to a ship, and I do not believe you can screen those lights to give a 4° angle. I have no doubt that all the gentlemen here have watched the history of the screening of lights, how the Board of Trade officers themselves have been probably working in the dark for all these years, and now there is an order to screen to 4°; and it may be diffused light or not, but whatever it is you see it at a much larger angle; on a dark, dirty night on the approach of a steamer you see a light, you cannot tell whether it is a light or diffused light, you see a light, and that is all you can go by.

2341. Where are your side-lights placed on board your steamers?—Our side-lights are in most of our steamers almost in a perpendicular plane with the masthead light, very near it.

2342. Do you think that is a good position?—I do not know, but there is one thing I am very certain of, that the Board of Trade, or the law of the land, ought to fix the relative position of the side-lights in all steamers to the masthead light.

2343. Would you not rather have your side-lights abaft the masthead light?—I think probably on the whole it would be better, but the distance abaft must be fixed and the height of the masthead light ought to be fixed relatively to the beam of the ship. You would find probably that one beam and a half of the ship would be a proper position for your masthead light, and then the side-lights one beam abaft the mast head light but, whichever position you fix, let it be universal.

2344. Would there not be a great difficulty in arriving at that?—I do not think it. I do not think there would be, but it would be a tremendous help in navigating in narrow waters or in dirty weather, if you knew that the side-lights and the masthead light were carried in a special position.

2345. Have you ever looked at your side-lights from your stemhead?—Yes.

2346. Can you see them there?—You can see the light from them. Yes.

2347. Both at the same time?—You could not see the lights themselves, but you could see the light from them. You do not require to do that in hazy weather; you can see them from the bridge of a steamer which has powerful lights, and for years past I have been with electric lights, powerful electric lights, the port light a 100-candle power light, and the starboard light to make it up to the same visibility as the port one, 200-candle power, double the power of the other; when a little haze comes on, you have only to stand on the bridge and you see the rays of light through the haze.

2348. What is the distance of your lights from the stem head?—The last ship I was in 40 to 45 feet; most of our lights are in towers.

2349. I think you have been on shore a long time?—I have not been long on shore.

2350. But an interval?—Yes.

2351. Were you superintending new ships then?—Yes, building.

2352. Do you know whether as a matter of fact in the Castle Line the chocks were reduced?—Oh, yes. I know that the point which struck me very much was that when the deputation waited upon the President of the Board of Trade I think I am correct in saying that it was stated that in one company in London, the P. and O. Company, 80 per cent. of the lights were above the angle of 4°, but there was never a word about the companies that had the lights screened in a line with the keel. Probably the gentleman did not know it, he was only speaking from his instructions, but certainly if the surveyors of the Board of Trade were asked now, they will tell you that in our company all the lights are screened in a line with the keel.

2353. And you think it is an omission on the part of the Board of Trade not to do it?—Oh no, I think it was rather a one-sided statement. I may tell you in connexion with the recognised rule as to the lights showing ahead to two points abaft the beam that some of the best lamp makers in the kingdom made the lenses of the lamps so that they could not show more than the 10 points, and the consequence is that if they were to show 4° across the bows they would take off the 4° from abaft the beam.

2354. You do not attach much importance to that?—No, but I want to show you really what has happened. One of our ships unfortunately came to grief and some of the salvage out of her was sent home, and amongst it was a pair of spare lamps, practically good new lamps, and they were sent down to Glasgow to be put in as spare lights for another boat, but they were condemned by the Board of Trade surveyors because they would not show more than 10 points; they wanted 4° more than 10 points. Those lights would not do so and they were condemned.

2355. Under the new regulations?—Yes.

2356. Then they were right there?—No, I do not think so; the regulation says nothing about it being more than 10 points.

2357. But the Board of Trade regulation says they shall be screened to 4°, and they were acting upon their instructions, were they not?—Oh, yes, perfectly. This is an old fashioned lamp—a shipping lamp, not a tower lamp.

2358. How do you account then for the Board of Trade having issued the regulation when there is so much opposition from seamen like yourself?—Probably by not taking the opinion of practical seamen; the work on board a tramp or even on board of a mail boat is very, very different from what it is in the Royal Navy.

2359. You think that they were not sufficiently practical?—That is about it, sir, really.

2360. And what you really contend for is that about the safest way to screen lights is to screen them so that they shall cross as little as possible?—So that they shall cross as little as possible.

2361. (*Sir F. Evans.*) I should like to make this point quite clear. When you say screened parallel with the keel, you mean roughly speaking that the screen is parallel with the keel, and the chock made so that the light that travelled from the edge of the light to the edge of the chock should be parallel with the keel?—Yes, I have not tested the rays of light business, but if the screen is put roughly parallel with the line of the keel, then the chock is placed parallel with the inner edge of the wick so that the edge of the wick shall not show across the bows.

2362. And you would take the light as a point, practically?—Yes.

2363. With respect to the placing of the lights, you say you attach very great importance, and I can easily understand it, to there being a uniform position of the side-lights in regard to the masthead light?—Undoubtedly so.

2364. Do you refer to a uniform angle?—No, I refer to this; that at the present time some ships carry their side-lights in the same plane as the masthead light; others carry them away abaft, and I think someone referred to the side-lights being away before the masthead light; you cannot judge, it is most awkward. If you knew the relative position of those lights you could tell at once what the ship was doing.

2365. That is to say if she was bearing a slight degree one way or the other you could notice it?—Yes, but not knowing the position of the lights you cannot now tell it, and you can understand that the point I want to make very clear is that the relative positions of the lights and the height of the masthead light should be regulated in all ships in some proportion to the beam of the ship.

2366. Now will you explain why, because I do not understand it?—We will suppose that a ship is 30 feet abeam, and that you decide that the proper height of the masthead light is a beam and a half, that would be 45 feet. We will suppose that the side-lights are to be a-beam, 30 feet abaft. You know that the lights are there, and you can judge very easily; but if you leave the height of the light without any proportion to the ship, it simply means that you will not regulate the light in the same way for all ships. I am giving it as a beam and a half; the actual height of course would vary; the larger the ship the higher she can carry them.

2367. I quite understand that it would give you a uniform height, of course?—And it would also allow you to judge the size of the ship you are approaching.

2368. Is that a matter of importance?—Oh yes, everything is of importance at night. You say to yourself "that is a big mail ship; we must be careful what we are doing," or it may be a smaller vessel.

2369. But still the greatest value would really come from its being a certain distance abaft the masthead light, so that you could see the decreasing angle in a moment?—I think putting the lights in the same plane has something to be said in its favour, but I think a certain uniform distance abaft the masthead light is the better plan.

2370. (*Captain Thomson.*) You said the side-lights in your vessels previous to the new Board of Trade rule were screened, I think, parallel to the keel?—Yes.

2371. Can you tell us what lamps were used when that was the case?—Electric lights.

2372. When that was the case?—Yes; as nearly all our lights are in towers, it does not matter whether they are electric or oil lamps.

2373. And 100 or 200 candle power electric lights?—Yes.

2374. Do you know what kind of filaments those lights had?—I think that in the first experience of them, we broke up a lot of them, but I could not tell you; they were incandescent lights.

2375. You do not know the shape of the filaments?—Oh, they were curled flames.

2376. Swan-Edison?—Yes, Swan-Edison.

2377. Can you tell me about what the diameter of the curl or flame was?—Well, they changed very much. I think we were about the first that used them, and they improved them very much afterwards. I do not think they would use them so powerful now. I think we found that we had them rather too powerful.

2378. If you did use 100 candle power filaments I should think that the filaments would be quite an inch wide?—No, not at all. Do you mean that the coil was an inch wide?

2379. The width of the filament. The angle at which it extends with the right angle; that is from one side to the other?—Oh, yes, it would be so.

2380. Were your lights screened from the outside or inside of the filaments?—That I could not tell you, but I know that the lights were not seen across the bows. I have experimented with them myself in dock. I could not tell you exactly how they were screened further than that I have gone ashore in Cape Town and seen and examined them myself.

2381. Practically you thought your lights were screened parallel with the keel, but you did not know the details of the screening?—No, I know that the lights did not show across the bows; therefore I assumed they were screened parallel with the keel.

2382. Do you not think it perfectly impossible using 100 candle power incandescent lights with a filament 1 inch wide subtending a degree and a quarter, that such a light would not show across the bows, or across the fore and aft middle line of the ship?—You could screen it so that they would not show.

2383. How could you screen it so that it would not show across the bows?—Probably if we found that it did show across the bows with great power, they would bring the chock further over to the outside of that filament.

2384. You would cover the filament with the chock?—I did not say so. I have already told you that I cannot tell you that was done, but I know that the lights did not show across the bows.

2385. I only want to arrive at what must have been the condition to satisfy what you said. I think I may say as a matter of fact, that a light of that power, and with a filament an inch in diameter at right angles to the keel, screened at the outer edge of the filament, would show across the bow at a moderate distance 7°?—Then we had the rays screened so that they would not show. It must have been outside of that.

2386. I think you said that with the 4° screening, according to the present Board of Trade rules, you were uncertain of the course of a steamer up to 8°?—Certainly, and up to 20° or 24° with diffused light.

2387. A meeting steamer?—Certainly.

2388. Is that quite the fact of the case. Are not the steamer's masthead and side-lights a partial indication of how a vessel is steering?—Not at all. There is no rule where they are to be placed. How can it be an indication?

2389. Is not the masthead light of a steamer always placed in the midship line?—Yes.

2390. If you see a steamer approaching you with a masthead light bisecting the two side-lights, does that give you any indication of how she is approaching?—You do not see a steamer at all; you see the three lights, perhaps the steamer is rolling. It does not give you the slightest indication.

2391. Even if the ship is rolling or pitching or even yawing, and you see that on an average the masthead light apparently bisects the two side-lights does not that

*Capt. M. P. Webster.*

15 May 1895.

give you any practical indication of how she is approaching?—Not practically.

2392. You do not think it gives you a practical indication that she is coming end on?—Yes, we are supposed to know she is coming end on; but I want it defined closer. I say that with the lights crossing the bows we cannot tell; she may be coming close on to us, or she may be 8° away from us.

2393. Do not the side-lights show with different intensities. Does not the light nearest you show stronger than the light on the opposite bow?—That depends upon the lamps. The lamps are very different.

2394. But with all lamps?—With lamps of the same power, yes. I understand what you mean. But we are speaking of my being on the bridge of a steamer looking at a light at night; I do not know what sort of lamps they have got. I see a light, that is all.

2395. I understand you to say that every little detail is of help in judging the distance and course of a steamer?—Yes.

2396. Then you do not think the two facts which I have mentioned are a help in showing you how a steamer is approaching?—I do not see if the lights are crossing the bow. You cannot tell within 8° what way that vessel is going. It is impossible.

2397. You do not think I am right in supposing you can actually tell in some cases when a steamer is approaching you immediately end on at night. You can also tell in some cases, in general cases, when she is steering away from you, that is, if she is on your port bow, and steering a course to pass to port of a parallel course, or if she is on the starboard bow, and steering a course to starboard of a parallel course?—No, you cannot judge under present conditions; if you adopt a universal placing of the lights, then your argument might come in, because with the slightest yaw of a ship with the side-lights in a fixed position, at an angle to the masthead light, she would show very quickly, but at the present time there is nothing to guide you.

2398. Then what you consider ought to be done is that there ought to be a fixed position for the lights, so that you could tell how the ship is steering within 8°?—Yes, I think you could, because if the ship yawed 8° you could tell.

2399. Then if that was done one of your present objections to the 4° screening would cease?—No, because you would still be in doubt. One objection is this arc of 8°, and with the light screened to an angle of 4° this arc is often 22° or 24°. The side-lights are to indicate the way the ship is steering, and I defy any person on a ship to tell on a dirty night exactly which way the ship is going within that arc.

2400. And you are in favour of a uniform pattern for lights?—Yes, decidedly.

2401. And you would have a small ship and a big ship carry the same pattern of lights?—I would not exactly say that. I would say that you ought to have a minimum power for any sized vessel, but you would not limit the large mail boats that carry more powerful lamps.

2402. You do not think then that a uniform lamp would be of advantage?—No, I think it is probably better that those fast-going ships ought to be seen at some further distance than the small ones, because undoubtedly on board of those fast mail steamers you have a better look-out than you have in the other ones, and every man knows that you are going fast, and every person is on the *qui vive* for the smaller vessel.

2403. And how far do you think you would see the side-lights of the smallest vessel on a fine night?—The Board of Trade says it should be two miles.

2404. Do you think it is that?—No, I do not think so.

2405. Do you think about one mile?—Yes.

2406. You think that would be the minimum?—No I thought you were asking me how far I could see it at the present time.

2407. Yes, certainly?—The Board of Trade says it shall be two miles, but I do not think you do see them two miles; I should say about one mile.

2408. Are you aware that good colza oil lamps have been seen at a distance of 12 miles?—Oh, yes, I daresay—why not?

2409. You think that is probable. Are you aware of that?—I am.

2410. And are you aware that the electric lamps, one especially of 200 candle power which you have mentioned, would give a light about 12 times greater than these colza oil lamps, which are seen at 12 miles?—That would depend entirely upon the colza oil lamp; we had those before the electric light. We had magnificent colza oil lamps with Chance's reflectors and everything. They are a very different thing to your ordinary colza lamp.

2411. That is what I am speaking of, a first-class colza oil lamp and a first-class Harvie lantern, that can be seen at 12 miles?—Yes, but that would be the white light, not the coloured light.

2412. I am speaking of the coloured light?—Well, it would be under a peculiar state of the atmosphere; it would be refraction. It would be a rarefied atmosphere. That is not the natural light. It is a phenomenal thing. You can see that off the Cape of Good Hope frequently.

2413. I only wish to compare the positions. If you could see the colza oil light 12 miles under ordinary circumstances, I think it follows you could see your 200 candle power lights at a greater distance, almost as far as you could possibly see it, according to your elevation?—Under those circumstances I question if you would see the electric light one yard further than the colza oil light, because you are seeing the oil lamps under abnormal circumstances, circumstances that are not natural at all, and I question very much whether you would see the electric light any further.

2414. I want to ask you a question about the period of oscillation of a steamer when steering to 2°; can you give the Committee any indication of what the length of time occupied is in making a complete oscillation of 2°?—It would depend very much upon the helmsman.

2415. I think that is a debatable question whether it does or does not. Can you give me your idea of the time that would be occupied in swinging that 2°?—Do you mean if I want to bring her those 2° straight off, or if the man is trying to keep her as steady as he can.

2416. No. I think you misunderstand me. You have told me already that when a skilled helmsman is steering her she oscillates 2°; that is, her head swings like a pendulum 1° either way. A pendulum has a period of time. In what time does that oscillate? Can you give me the time which is occupied during the period that she oscillates that 2°?—But the ship is under the control of a man who may be a good or a bad steersman. The pendulum is going naturally. There is no period whatever of oscillation.

2417. You think if your ship is going 18 knots, perhaps there would be no period of oscillation?—At 18 knots there would be no period. It depends entirely upon the man at the wheel.

2418. Do you think she would swing 2° under ordinary steerage in a second of time?—Well, she would do it in two or three seconds.

2419. (*Captain Wilson Barker.*) I think your lights are screened to about 1° to the inner edge of the wick?—Well, they are screened now, of course, according to the recent Order.

2420. Supposing they are screened to 1° as before from the inner side of the wick which would allow about 1¼° across the bow if it was an inch wide. You can take that as about right. Supposing you saw a vessel coming down on your starboard bow with her green light open about 2°, you said just now you would starboard to that vessel, did you not?—Certainly, for the reasons already given.

2421. Suppose the other vessel not seeing your other light but only seeing your green light, holds on, and you only starboard a degree or two, as he comes closer to you he probably might see the diffused rays from your red light?—That is my argument against the diffused rays.

2422. And then he will probably port his helm; you cannot cut off all the diffused rays, but they are only visible at a very short distance?—If you see a green light 2° on your starboard bow I maintain that if you see nothing but that green light you must take that ship as a crossing ship and your duty would be to starboard.

2423. Suppose the other man does not look at it in the same way?—Very well, that is how collisions arise.

2424. Because you see as he comes close you may think it is perfectly safe; but he sees the diffused rays from your red light very likely, or the glimmer, and he thinks probably you are altering your helm as he gets close?—But do you not see if I am starboarding my helm I am shutting in my red light all the time very rapidly?

2425. That is so if you put the helm over much, but I understand you to say you would only put it over slightly just to give her a little more room?—Yes, but when you go starboard for a while in that way you would certainly go away a point.

2426. Then there is no reason why you should not port according to the regulation?—Pardon me; if I see a green light the ship may be crossing my bows, I may be running into that ship if I port.

2427. You have got the masthead light to tell you?—That I have not. That is exactly my argument; the side-lights and the masthead lights are placed in any position you like, and I cannot tell how that ship is going.

2428. But if that light was screened to 4° that would show exactly whether the vessel was coming down ahead or not?—How so?

2429. Because you would see the red as well as the green light, and then you would port your helm?—Yes, that is so.

2430. I am speaking of two vessels which are meeting end on with a very fine screening—that is the case I am supposing. You say you would starboard your helm a little bit. I am saying you would only starboard a little to give a little wider berth; there is no reason why you should starboard at all if you follow out the regulation?—With ships of wide beam 2° is not wide enough.

2431. But supposing the other man thinks it is enough. We have to consider a young man who is in charge for the first time perhaps as officer of the watch. He knows the regulation says, "Green to green," and he is perfectly safe?—The regulation; I do not think you can read it that way if you see a green light right ahead and you see no other.

2432. This is on the bow?—2° on the bow is a very small angle. In fact if you are walking on the bridge of a steamer you can only take the 2° from the midship line, and if you went to the one side it would look as if it was on the one bow, and if you went on the other side it would look as if it was on the other bow, therefore, for practical purposes, it is right ahead, and your duty is to starboard.

2433. Do you not think it is rather too fine to have them screened from the wick like that?—No, I do not.

2434. Is it not better to have the screening a little wider so as to make it quite sure?—I think more collisions have occurred through the port helm business than through any other cause. Why should you not starboard? Why should you port, with only a green light in sight a little on your starboard bow?

2435. I do not see why, except it comes under the old sailing rule, does it not?—Yes, but all the recent rules of the Board of Trade have tried to put that out of their heads, and very justly so. You never hear of any port helm now; they say you shall pass starboard to starboard and port to port; and they have discovered that the sooner we eradicate the port helm business from the minds of old and young officers the better.

2436. But do you not think it better to have a clear understanding in a case of the sort than to leave it to a man's discretion?—I say it is not left to a man's discretion. I say in the case you have put to me the duty of the man is to starboard, and there is no doubt about it, that is, when he only sees the green light.

2437. It is quite opposed to the regulations?—I do not see; I have studied and read the regulations, and I say that is the regulation; you cannot tell how that ship is standing; she cannot be coming right down on on you or you would see both lights but she may be going right across or crossing your course at a very small angle.

2438. If he follows that he has got a green light to his green light; if he stands right amidships he will see that it is on the starboard bow, and he will have the green light opposed to his green light, and he will hold on?—But if you starboard it is quite safe.

2439. I do not see it?—In practice I think it is right.

2440. (*Captain Castle.*) You cannot sail a ship by book or by rule; do you think you can?—Hardly.

2441. A little must be left to discretion?—Certainly.

2442. And if you see a green light 2° on your starboard bow you would starboard?—Certainly, under the conditions already named.

2443. If you saw the other man was yawing about you would starboard a little more and let him see exactly what you intended to do, would you not?—Certainly.

2444. (*Mr. Bolam.*) You were asked something about your experience in the screening of your side-lights. You went on shore at Cape Town and saw for yourself at what angle the light crossed?—Yes.

2445. In doing that you were performing the very experiment which the Admiralty perform for everyone of their own ships though you were probably not aware of it?—Yes, probably.

2446. Therefore, from what you saw you satisfied yourself perfectly as to the screening of your lights?—Yes.

2447. Are you perfectly certain that the angle was such that the lights were practically screened to show right ahead and scarcely at all across the bow?—Yes.

2448. To nothing like the extent of 4°?—To nothing like the extent of 4°.

2449. And for how many years were you sailing in mail steamers with small screening perfectly determined by yourself?—23 years.

2450. So that you have had 23 years' experience of navigating a ship with a small angle of screening?—Yes.

2451. Therefore, if one wants to know whether a small angle of screening is a safe angle or not one may safely take 23 years' experience?—Yes.

2452. Therefore we have experience, and ample experience, that a small angle of screening conduces to safe navigation?—I think so.

2453. Have you ever collided with a ship?—Never. I have in the Thames, with a pilot in charge, but not with myself in charge.

2454. But in the open ocean?—No, never.

2455. Have you never experienced a collision?—Never.

2456. And are you perfectly satisfied in your own mind that a small angle of screening is perfectly safe for ocean navigation?—Certainly, the smallest possible angle.

2457. Do you know how these filaments are placed in the electric light, whether the coil is placed broad-side on or ahead, or at an angle?—The filament is up and down. The pear-shaped lamp hangs up and down.

2458. In the case of electric light and screening to 4°, the Board of Trade have practically compelled you to show as nearly as may be an unbroken light over 10 points of the horizon *plus* 4°?—Yes.

2459. There is a question whether screening at 4° conduces to safety at sea, whether 4° is not better than 2° or 1°. Take this case: Two vessels stem on; if they go on, of course there is risk of collision?—Certainly.

2460. But a very simple rule, of course, is for steamers to port their helm, both to port, of that there is no doubt?—The Board of Trade does not say so.

2461. The International Regulations say so?—But they say you are to move your helm so as to enable you to pass port to port.

2462. Therefore there is a very plain rule for that?—Yes.

2463. If the two steamers have the port lights just a little on their port bows there is no risk, because, in that case, they must pass clear; both, I suppose, are certain to port?—Certainly.

2464. The risk comes where you have a case where two vessels are showing each a green light very little on her starboard bow. Now, the Board of Trade have put in a table which shows that where vessels are screened to an angle of 4° across the bows, if two vessels are 60 feet beam, each approaching the other on parallel courses, and they see the lights 4° on their bows at a thousand yards distance, that is, just hiding

*Capt. M. P. Webster.*

16 May 1895.

the red, and the green is showing 4°, they say that these vessels will pass each other just clear by 119 ft., that is, 2 beams. For ocean navigation is that, in your opinion, a safe distance for vessels to pass?—Certainly not.

2465. Then if that is the outcome of screening to 4° as compared with 3°, or 2°, or 1°, in your opinion does the screening to 4° conduce to absolute safety at sea where green is shown to green?—By no means.

2466. And would that be perfect safety, even with 4° screening, green to green, red to red, perfect safety, go ahead?—Certainly not.

2467. Did you ever believe that was a safe rule?—It was never meant as a safe rule.

2468. Did any officer you ever had in your employment ever believe it was a safe rule?—Never.

2469. Is it not the case that wherever any light is seen, if it does not change its bearing there is danger?—Certainly.

2470. And does every officer on the bridge know that?—Certainly.

2471. And is there any case where the screening should be altered to preserve that rhyme?—No.

2472. Is not that rhyme in many cases absolutely misleading?—Yes.

2473. And is it not the officer's duty to watch the bearing of the light?—To watch the bearing of the light; an officer who, whenever he sights a light, does not go and take its bearing is not fit to be on the bridge of a steamer.

2474. Can you give any reason conducing to safety at sea for having a large angle of screening. Can you state any advantage which would occur in promoting the safety of navigation at sea depending upon the adoption of a large angle?—I cannot.

2475. (*Mr. Scrutton.*) If a vessel was 2° on your starboard bow would it be possible for you only to see the green light?—Certainly, because I might be going *that* way and the other vessel might be coming *this* way [*describing*].

2476. We will suppose them meeting each other?—That depends upon how the lights are screened.

2477. (*Sir E. Harland.*) Have you had any experience with dioptric lenses in your vessels?—I think some of them are fitted with dioptric lenses.

2478. I mean the lenses with the ridges; they are cut?—Yes, they are; we have got them at Chance's; they are very expensive lenses.

2479. And you think they are preferable for concentrating the rays of light more evenly on to the level of the water ahead of you?—I think they are; they are very much finer lights. We can tell at sea always when we pass one of our ships with those fine lights; we can tell by the light what ship it is.

2480. But is it the dioptric lenses which make the light a clear one, or is it that those lanterns with dioptric lenses fitted to them, being more expensive, are generally better fitted?—They are generally a little more particular about them; those lenses cost 20*l.* or 30*l.* each, and they do not put that sort of a lens into a jerry lamp.

2481. Can you give me any information as to whether the advantage arises from the dioptric lens, or is it that you think they are better supplied with burners and wicks?—Well, I think a little of both.

2482. With regard to throwing the light down in the water, do you think there is anything in that in practice; if you are meeting a ship with dioptric lenses, do you think that she concentrates the lights more on the level of your eye than wasting it up in the sky, or throwing it on the water?—No, but it is a more powerful light.

2483. Then from the optical point of view, you are not so very decided?—No, I know nothing about it.

2484. Whilst you are aware that such are invariably fitted in lighthouses?—Yes.

2485. And of course are very carefully cut and ground to suit that particular arrangement. You are not aware that that is the case in your lamps especially?—No, they are done as well as can be but you must remember that they are most expensive things; for instance, in lighthouses they cut those glasses so that the rays shall go in a certain direction. It is folly to do such a thing on board a ship; the ship is tossing about in all directions.

2486. Have you noticed that in those side-lights with dioptric lenses the whole lamp at a distance appears to be illuminated?—The light is more diffused; yes, undoubtedly.

2487. Then you think perhaps that the dioptric lenses perhaps may account for some of the witnesses who said, as you I think have done, that there is really no dark lane; that there is a diffused light?—Undoubtedly.

2488. Coming from the lamp in some direction or other?—Undoubtedly.

2489. Do you think that it may come from the glass portion of the lamp rather than from the direct ray of light from the wick?—That I cannot answer.

2490. For instance you will understand what I mean in a room where the gas is enclosed by a cut globe, or still more so by one of those white glass globes where you cannot see the light at all, and where the whole thing looks like a full moon?—Undoubtedly; cut glass diffuses the light more around.

2491. Therefore you think it is possible that this so-called diffused light reducing the amount of what is called the dark line may arise from the optical refraction of light through the dioptric lenses?—Possibly so.

2492. Some questions were put to you with regard to the advantage which you thought would be gained if there was a relative angle agreed upon as between the masthead light and the side-lights. Assuming *that* is the deck of the ship for the moment, suppose *that* is the mast, and that on the mast *here* is the masthead light, and that immediately from the plumb of the mast there are the two side-lights, the question was put to you by one of the Committee as to whether you were not able to judge as to how the ship's course was being altered by reason of the change of angle between the masthead light and the side-light, and I think you said you could not judge how her course was altered?—No, because we do not know the position of the side-lights.

2493. *Here* is a case: You can see the masthead light, immediately below it is the starboard light, and *here* is the port. You will see now by my turning that illustration round two or three points, that so far as the relative position of the two side-lights and the masthead lights are concerned, it makes no change whatever?—No. But if you do *that* it will. [*Describing.*]

2494. Exactly. Now we will come to the point. Supposing that was the case, where the side-lights are below the plumb of the masthead light, you suggested there should be some fixed position, and the side-lights should either be before or abaft the masthead light?—No, not before. I am very much against that; either in a line or abaft.

2495. We will assume abaft?—*Here* is the masthead light. *That* is the port light. *This* is the starboard light. We will assume for the moment that this is an angle of 45°—as you expressed a wish that there should be something definite agreed upon by all—now you are meeting this ship end on, and she starboards?—Yes, you see at once.

2496. There are very few degrees difference between the relative positions of the masthead light as compared with the position of either the starboard or the port light. Assuming you still can see them, that would give you an idea that *this* ship was coming *so*?—Decidedly you can see them. You could see how she was altering her helm at once.

2497. By reason of the side-lights not being under the plumb of the masthead light?—Unquestionably.

2498. That being the case you would advocate that the side-lights should be placed at some definite angle abaft the masthead light?—Yes, at some definite angle, but my point was to agree first of all that there shall be a universal relative position of the side-lights to the masthead light of a steamer, and then I think the question of what that position ought to be should be properly threshed out.

2499. But have you thought out the matter as to the angle of 45°? We all know what a perpendicular line is, and we all know what a horizontal line is, and if an

angle of 45° could possibly be arranged, then it would be fixed in your memory?—Yes, it would amount exactly to my principle of taking the beam of the ship, because the beam of the ship would regulate it considerably.

2500. Taking the beam of the ship would affect it?—Yes. Of course in the smaller ship with a small beam you cannot get such a high light for the masthead light.

2501. But is it not the fact that the masthead light is placed very much in proportion to their beam?—Certainly.

2502. Would there not be some difficulty in making this arrangement? For instance, some ships have only two masts and others have four; again, in some ships the sidelights are not placed with any relation to the masthead light, but simply wherever the captain's bridge is?—Yes.

2503. Let us put that aside for the moment, and say that a ship had double side-lights; say for arguments sake that *that* is the captain's bridge, and *there* is the rail; supposing *this* is the starboard side, and you have the side-light down *here*, and at an angle of 45° up *here* you have another side-light at the side of the ship, would that answer the same purpose, because as this vessel turned round if you were dead straight ahead of the ship each side-light would be exactly below the other one?—I do not just follow that. You have got a green light.

2504. Two green side-lights, one above the other, but at an angle of 45°; in other words, if you saw the two green lights in *that* direction would you not in the dark know that you were exactly abeam of that ship?—Yes, if that was universal.

2505. And assuming that that rule was universal, and you had the two side-lights as I have shown you, if you saw the two side-lights at an angle of 45° you would see therefore that that ship was exactly crossing your beam?—Do you mean to do away with the masthead light?

2506. I am mentioning this to you with reference to the difficulty there would be in placing the masthead light always at an angle of 45°?—There would be no difficulty. Very few masthead lights are carried on the mast, they are carried on a stay.

2507. But where is the stay fixed if you have not a mast?—Oh, but you must always have a mast, though you do not keep it in the same position. You can always move it to get your angle.

2508. But suppose the mast is so near your bridge that you could not place the masthead lamp sufficiently far forward?—But your stay will keep it right.

2509. Are you in favour of the masthead and the side-lights being at some uniform, recognised, or fixed angle, or do you think that if there were great difficulty in doing so these double side-lights on either side of the ship would meet it?—Certainly not. You would revolutionise the whole of our mercantile marine. We have enough to do with lights now without having that.

2510. I am merely following out your remarks with regard to the masthead light?—And another point is, in those bad times you would have more lamps for these tramps.

2511. (*Rear Admiral Andoe.*) It is a very objectionable thing, is it not, to have any glare of light, or any light thrown on the bridge on a dark night?—Undoubtedly. That is my objection to the lights being on the bridge.

2512. Even if the lights were further abaft and on the same plane as the bridge, or below it, it would throw a certain amount of glare, would it not, on the bridge?—Yes.

2513. Therefore the right, as I understand you to say, should not be abaft the bridge at any rate?—Not if it could be helped. I say that once having recognised the fact that some universal principle should be established for the carrying of those lights in the relation of the masthead light, then my argument is that the whole of that should be properly threshed out by practical men. I would have two or three captains of tramps up here to help fix the position, and captains of small boats too, and go through the whole thing properly.

2514. One point is that you should not have by any means any glare from the lights on the bridge?—That is one of my arguments. That is why I was inclined to the perpendicular plan, because I know now from practical experience that it is a great benefit to have a light 50 or 100 feet before the bridge, where there is no glare to interfere with the officer's eyes.

2515. It is very distressing, is it not?—Yes. Even now, when you are getting into hazy weather there is nothing more distressing than the glare of a green light in a haze. You can see nothing through it.

2516. Therefore, supposing the lights are placed on or near the bridge, you would regulate their position relatively to the masthead light by moving the masthead light away from the other lights at a certain angle?—Well, if they are on the bridge they are not far enough aft. You would find they would require to go forward of the bridge in most steamers.

2517. Or would you prefer to have them in front of the bridge?—Oh, certainly.

2518. (*Captain Thomson.*) There is a question another member of the Committee wished me to ask you. Take the case of two ships meeting on opposite parallel courses with their side-lights screened to 4°, and they both see each other's side-lights, would you prefer that both ships should port, according to the rules of the road, or that they should go on their courses? I must tell you that distance is half a mile (*describing with the models*)?—I am afraid that supposing the two ships were going 16 knots an hour they would be together in half a minute pretty well. I am afraid that is exactly what would happen. And that is my argument against the screening of the lights across the bows, that they would both say "We must port." The half mile is so very close, and they would have a very close shave when they came up *here*. That is my argument against the screening across.

2519. Then you would prefer to stand on?—No, the rule of the road would compel me to port if I saw all the lights.

2520. I must tell you the distance is worked out *here*. The clearance you would have, if you stood on your course, would be 135 feet?—Yes, but that is just my argument. If the lights were not screened across the bow I can only see the green light. Then, as I said before, any prudent man would starboard a little.

2521. That is not quite the point you see. What I wanted to ask you was, whether you preferred to port in that case or stand on?—I am bound to port. I see all three lights, and according to the rule of the road I am bound to port, practically, because with 4° they would say that the ship was ahead.

2522. Having ported, do you consider the two ships would pass more or less apart than 135 feet?—That depends upon the rapidity with which they answer their helms. If they would port long enough they would go that way.

2523. You understand what the question is?—Perfectly.

2524. Can you tell me what distance you think you would pass when in that position, roughly?—I cannot. It depends upon the way you steady your helm.

2525. (*Chairman.*) Perhaps you can tell me this from your practical experience. What idea can you give me of the course which a vessel actually does pursue when her helm is ported or starboarded?—There is no doubt that the first action of the helm upon any ship is to throw her stern over, not her bows.

2526. Supposing now you assume that vessel starboards her helm [*describing*]. Can you move that vessel at sea as you move the models?—Much depends upon the rapidity with which she is going.

2527. Supposing she is going 16 knots an hour?—She would go *that* way very rapidly when you put the helm over. But then I do not know what we are doing. We require to do this on a scale. *This* is a ship, and *that* distance is only four times her length. In four times her length a ship going 16 knots ought to alter *that* way about 3 points.

2528. It has been suggested to me, and I have often heard it said, that a vessel feels her helm and goes away at a much sharper curve after a little bit than she does at first?—Oh, yes, because everything depends upon your steering gear—steamers sometimes have very rapid steering gear. We now have in some of our ships the steam gear right aft, and it just opens with a little valve. You can put the helm over in 30 seconds. Of

*Capt. M. P. Webster.*

16 May 1895.

course the ship goes gradually till the helm is hard over. Then when the helm is hard over she goes faster.

2529. What I was rather suggesting was, that if you have vessels as near as half a mile, and they are, so to speak, porting across one another's bows, the danger is considerable unless their helms act pretty quickly?—Just so.

2530–1. I understand that you attach considerable importance to the style and the class of lamps being supervised by the Board of Trade, so as to ensure, at any rate, a fair amount of excellence?—Yes.

## Wednesday, 22nd May 1895.

PRESENT:

SIR FRANCIS H. JEUNE IN THE CHAIR.

Rear-Admiral ANDOE.
Captain WILSON BARKER.
Mr. BOLAM.
Captain CASTLE.
Sir EDWARD HARLAND.
Captain HALLETT.
Mr. SCRUTTON.
Captain THOMSON.

Mr. C. HIPWOOD, *Secretary.*

*Vice-Admiral P. H. Colomb.*

22 May 1895.

Vice-Admiral P. H. COLOMB called and examined.

2532. (*Chairman.*) I believe you have studied the question of lights, from 1858 until 1863 especially?—Yes.

2533. You were dealing, were you not, for the Admiralty, with the general question of the rule of the road in 1867?—Yes.

2534. And your attention was especially called to the question of side-lights by the loss of Her Majesty's ship "Amazon," and the steamship "Osprey," which occurred in that year?—Yes.

2535. I think you watched the case for the Admiralty before the court-martial, and advised with counsel for the Admiralty before the Admiralty Court?—Yes.

2536. What were the causes to which, in your judgment, the loss of those two ships was due?—I thought it was due to the defective state of the law in compelling port helm under conditions when port helm was clearly dangerous; and, secondly, from the defective screening of the side-lights, which allowed the "Osprey" to see the red light, and the red light only, of the "Amazon" at the time when, as far as the "Amazon" was concerned, it was believed that she was on the "Amazon's" starboard bow.

2537. I do not know if you remember sufficiently, but would you tell me very shortly what the nature of the case was. I have not the incidents of it in my mind?—The nature of the case was this: the ships saw one another a great distance apart—at least 20 minutes in time; the "Amazon" observing a steamer's mast-head light on her starboard bow starboarded a little to keep her sails full; the "Osprey" on her side, seeing the mast-head light of the "Amazon" and soon after the red light nearly right ahead, began to port her helm; presently the green light came into view, she saw both together and then the green only, and continued to port her helm, so that the two ships were running with the "Osprey" on the starboard bow of the "Amazon," and the "Amazon" on the port bow of the "Osprey," and that went on till the "Amazon" ported, but too late to avoid the collision.

2538. Did the "Osprey" run into the starboard side of the "Amazon"?—The "Amazon" ran into the port quarter of the "Osprey."

2539. I think that in conjunction with Rear-Admiral Brent you examined every case tried in the Admiralty Court for the last 10 years?—Yes.

2540. And did that examination confirm the conclusion that you had arrived at in connexion with the previous cases?—Very fully.

2541. I think you and Admiral Brent drew up a pamphlet showing the large per-centage of collisions directly due to the defective law and the defective screening?—Yes.

2542. Then, in February 1868, I think you delivered a lecture, did you not, to seamen and shipowners, which the late Mr. Thomas Gray attended, upon the subject of side and mast-head lights?—Yes.

2543. Did you exhibit screens as usually fitted then, with various types of side-lights, and did you explain how most side-lights showed for a point on the wrong bow, and how the better the lights were the worse they were screened, in consequence of their increased size?—Yes.

2544. And I think you also pointed out, did you not, the danger that arose from that imperfect screening?—Yes.

2545. Did you explain how, by means of a chock at the end of the screen, the inner edge of the wick and the outer edge of the screen should be brought into a line parallel with the keel?—Yes.

2546. And you explained also that as a flame had a certain diameter it was impossible that the whole of it could be seen right ahead of the light and none of it on the wrong bow?—Yes.

2547. And you also, I think, stated that owing to the impossibility of making red and green equally visible in all states of the atmosphere, there was great danger of only the wrong light being seen unless the arc was restricted in the manner explained, which was entirely in accordance with the law?—Yes.

2548. What did you understand to be the view of Mr. Gray at that time?—I thought that he entirely accepted the view which I put forward, and entirely agreed that proper screening was that the line joining the outer edge of the screen and the inner edge of the wick should be parallel to the line of the keel.

2549. So that I presume you were surprised when the explanatory clauses were issued limiting the port helm to cases where both side-lights were seen right ahead?—Yes.

2550. Did you think it had been quite understood that the law contained in Article 3, sub-section (*b.*) and (*c.*), was to be as strictly carried out as possible, in which case both side-lights ought never to be visible to one pair of eyes except for mere moments of time?—That was my view.

2551. I think you took occasion to remonstrate upon the lines which had been pursued?—Yes.

2552. Then I think you came to understand, did you not, that instructions were given to surveyors to screen the lights so that the inner edge of the wick and the outer edge of the screen should be in a line parallel with the keel?—Yes.

2553. That was your view?—Yes.

2554. I think you took an early opportunity of drawing the attention of the Admiralty to the screening of side-lights of war ships, and a correspondence took place upon that subject?—Yes.

2555. You watched, did you not, for the results in the records of collision cases as they occurred from time to time. Now, what did you observe with reference to those cases?—I think I used to look at every case in days gone by, whenever it was reported,

and the conclusion I came to was, that it was quite clear that the screening of the side-lights and the explanatory clauses and the law together had practically banished the law of compulsory port helm; and the cases in the Admiralty Court were very rare where compulsory port helm was held to be correct; that the cases in fact became what are called "crossing" cases, instead of "end on or nearly end on" cases. I also noticed, and as far as I know that still continues, that in the reports of the evidence given by the witnesses they have ceased to see both side-lights with the same frequency that they used to see them in former years.

2556. I think at a later period your attention was drawn to the Instructions to Surveyors of 1875, was it not?—Yes, I think so.

2557. Did you notice what appeared to you to be two discrepancies in those instructions?—Yes, if I recollebt right, the discrepancies were brought to my notice, but I do not recollect how. The discrepancies were at pages 79 and 80; the diagrams 6, 7, 8, and 9—I m speaking of the edition of 1875, which I have before me—did not agree with the text; that it was stated in the text at page 82 "Surveyors will probably find that "if the inboard edge of the wick touch a line that is "parallel with the keel of the ship, and that cuts the "outer edge of the forward end of the inboard screen, "the rays will cross suitably." The discrepancy was that none of the diagrams showed such a line. Secondly, that there was a discrepancy in the omission of reference to the law which directed screens to be placed so as to prevent these lights being seen across the bow, and in stating that for both lights to be seen ahead it was necessary that the red and green rays should cross at a certain distance ahead. That seemed to me to be making the screening of the lights suit the explanatory clauses which were really at variance with the fundamental order as to screening.

2558. However, I think you did not consider those matters of very great importance so long as the compulsory port helm had practically disappeared?—Quite so. I used, as I say, to examine every case, and it seemed to me satisfactory that the seeing of both lights had practically gone, and the port helm had practically gone with it.

2559. I think the conclusion which you came to with regard to those instructions was that the diagrams and references to the lens at page 82 were only mistakes?—That is what I thought, because otherwise, if the word "lens" were substituted for "wick," it would, of course, make the screening depend upon the size of the lantern. In which case you would have worse screening the bigger the lens was.

2560. So that a small lens would limit, and a large lens would extend, the crossing angle of the light?—Quite so.

2561. I think in your view, as far as you are able to judge, Mr. Gray agreed with you, did he not, as to the proper screening?—Yes, entirely.

2562. And you thought that the whole difficulty had arisen from the issue of the explanatory clauses before it had been thoroughly understood that the common sight of both side-lights together was due to imperfect screening?—Quite so.

2563. In your judgment do you think that anything more is necessary than to make it a rule that the inner edge of the wick and the outer edge of the screen should be in a line parallel with the keel?—I think nothing more is necessary.

2564. And that is in substance the view you wish to present, is it not?—Entirely.

2565. I think you for a considerable time considered the question of minor importance, did you not?—The question of the screening of the lights?

2566. Yes?—Yes. As soon as the screening had limited the arc so that the seeing of both lights practically disappeared at sea—and I should say that I took opportunities whenever I was at sea of watching every ship I could, and I found that, as a rule, the ships I met at sea only showed their two lights together just for an instant of time, and I thought that when that end was achieved the whole thing was achieved—I did not want to meddle with that any more.

2567. (*Mr. Bolam.*) Would the Admiral give the dates of which he was speaking just now of his having been at sea and noticing these lights?

2568. (*Chairman.*) Yes, please?—Constantly when crossing the Channel, whether to Ireland or to France, up to 1889, and in the year 1889 particularly, when I was attached to the "Rodney" as umpire in the Naval Manœuvres.

*Vice-Admiral P. H. Colomb.*

22 May 1895.

2569. I do not know whether you have had your attention called to this: that it is suggested by the Board of Trade, as the result of experiments, that if the light is screened as you suggest to the inner edge of the wick, that the full and uniform power of the light will not be seen for the whole ten points, that is to say, it will not be seen to its full power ahead of the vessel?—I think it will be seen for the full ten points, but of course you may say that exactly in the line of keel some of the light will be lost; that is, that the full light will be seen ahead of the light, but not in the line of prolongation of the keel.

2570. You know, of course, the rule says there is to be an unbroken light. You would attach importance, I suppose, to the full power of the light being seen ahead, without drawing the distinction between ahead of the keel and ahead of the light?—No, I must draw the distinction, I think, between ahead of the light and ahead of the keel. I do not see any necessity for making the full light show ahead of the keel.

2571. That is what I meant; but you would attach importance to the full power of the light being shown ahead of the light?—Certainly.

2572. Do you attach any danger to what is called the "dark lane" which it is said would be formed by a light being screened in that way?—None at all. As I say, watching ships at sea entirely with a view of establishing the case which is before the Committee, I have never seen that dark lane, and yet I have only seen both lights for a mere moment of time, and in some cases not even together. I think that owing to the yawing of the ship; I do not care how well a ship is steered, she will always show first one and then the other light. There is no such thing as a dark lane with properly screened lights.

2573. I daresay you have often heard the Board of Trade argument that unless the lights to some extent cross the rule or rhyme as to green to green being perfect safety cannot be observed?—I think it is the other way. I think if you allow the lights to cross more than you can possibly help that this result commonly follows—I know from examination of cases that it does commonly follow, and I think it might be expected to commonly follow—it is very difficult to get the green light to show up to the same power as the red light, and if you have it right in one state of the atmosphere it will not be so in another state. You cannot guarantee equal power in the two lights. Now if the lights cross, you get a case such as you had in the "Amazon," that is to say that the more powerful light is seen alone, when according to theory both are seen; you practically ought to be seeing, from the way the lights are screened, both lights, but you are only seeing the red light because of the difference in power—the difference in penetration—of the lights, and you are seeing it on the wrong bow.

2574. So I understand your view to be that the right thing to do to comply with the International Regulations is to screen the lights so as to cross as little as possible?—Clearly so. That is to say, that you should get the full light ahead of each light, and then never mind about the crossing. You must have that. You see you cannot, according to the diameter of the wick, possibly avoid the crossing, and there will be a certain amount of that whatever you do; but you ought to reduce it, I think, to the minimum.

2575. I see you recommend the screening from the inner edge of the wick. Of course the same results can be obtained by screening from the outer edge of the wick, allowing a larger angle. I do not know whether you have any preference for screening with reference to the inside of the wick rather than screening with reference to the centre, or the outside of the wick?—I have a distinct preference for the inside of the wick, because then I am not troubled with the size of the wick, the diameter of the wick. The moment you begin to deal with the outer edge of the wick you are coming to the question of the width of the wick itself. If you have a very wide wick you have one result, and if you have a very narrow wick you get another result. You may have your lamps, for instance, sometimes with a circular wick, and sometimes with a long wick, which may be placed, perhaps, in the line of the keel, or at 45° to the line of the keel, or at right angles to the line of the keel. In all those cases, as long as you are dealing with the inner edge of the wick you know what you are about. All you know is that the extent of the

*Vice-Admiral P. H. Colomb.*

22 May 1895.

wick, the diameter, if it is large, will show the light more across the bow, and if it is small less across the bow. But I do not think you can go to a greater nicety than that. It does not seem to me practicable.

2576. Of course, as regards electric lights, the question does not arise. The filaments of the electric lights are so fine that I suppose there you would be satisfied with the chock coming up to really any part of the film of the electric light?—I do not know how it would be with the arc light. I have never really tried experiments upon that head with the arc light, but the diameter is very small. The incandescent light however has a sensible diameter according to the number of convolutions in the filament and how they lie with reference to the line of keel.

2577. Of course, then you would follow the same principle, and screen to the inner edge as a common rule?—Yes.

2578. (*Rear-Admiral Andoe.*) Do you think that seamen as a rule were fully aware that from all times, as far as we know, the rays of the light crossed the path of the ship at a considerable angle?—My impression is that seamen did not think very much about it. I think that really is so; those that have examined, I think must know that it is so.

2579. But of course if the wick is an inch and $\frac{3}{8}$ths we will say, or a broad wick, and the screen set as you propose, parallel with the keel, it gives an angle of something like 2° for the light to cross the bows?—Yes, that is for the extreme outer edge, but of course this represents an infinitely small amount of light. As your screening acts, it cuts off portions, as it were, so that you have got very little light going across. Supposing the extreme edge goes across 4°, that which goes across 4° is a very small amount of light; a little more goes across 3°; a little more goes across 2°; a little more goes across 1°; and the whole of it goes right ahead of the light; it is gradual.

2580. But still there is a very considerable angle at which the light would cross the bows on the path of the ship?—Yes.

2581. And in the electric light that angle would be very much reduced, would it not?—Yes, in cases.

2582. Vessels yaw when they are being steered, the best ships 2° or 3° each side of the course, and we are told the ocean tramps as much as a point, or even a point and a half, they steer so wildly. Supposing you were in charge, we will say, of an ocean tramp, and she was yawing a point on either side of her course, and you saw a large mail steamer coming down, say, a quarter or half a point on your starboard bow, showing nothing but her green light, you naturally would keep your course, I presume, or possibly give starboard helm to give her a little more room; but the ship coming down towards you would see your two lights, red and green, first one and then the other, or possibly both?—Yes, but I should be very cautious about starboarding.

2583. Seeing both your lights right ahead, she following the rule of the road, would port her helm, therefore the big ship coming down, the mail steamer, would be giving port helm and the tramp, having only seen her green light, due to her steady steering would be giving starboard helm to keep out of her way?—Quite so; if she starboarded.

2584. How does that case occur to you with reference to fine screening. The mail steamer would have been fine screened to, say, 2°, and steering steadily?—I think it devolves upon the mail steamer if she continually sees the change of lights in the tramps to be cautious as to what she is doing it is only the law of port helm which makes the danger. It supposes you to know that the other ship sees both your lights, whereas you cannot know. In the case of approach such as you suggest can you possibly make sure in one ship what the other ship thinks?

2585. The Board of Trade officials contend that by the lights crossing at 4°, for instance, the tramp in the case I have mentioned would see both the red and the green light of the mail steamer approaching her, and would consequently port her helm to clear her, and she likewise would give port helm, having seen both lights of the tramp, and they would clear one another?—This sort of thing lies at the bottom of the great mass of collisions. You must understand, first of all, that when you get within certain distances, if there is any considerable angle between the courses port helm for both will cause a collision for certain; whereas the starboard helm for the one and port helm for the other that is, turning towards each other, will make a collision absolutely impossible. I have all along endeavoured to abolish that compulsory port helm, first, because its safety entirely depends at a distance upon the two ships being agreed, which is an agreement it is impossible to get; and, secondly, if they are both agreed, and yet their courses cross at some angle, and they are pretty close to one another, if they both port their helms they will certainly collide. But if they obey the signals which would be made by properly screened lights, and the one starboards to the green light, and the other ports to the red light, it becomes impossible for these two ships to come into collision.

2586. Supposing that this very fine screening were adopted, we will say, and both ships had electric lights, and screened so that the light should not cross the bow at any appreciable angle, and that they were approaching one another green to green, so that each saw the other's green light nearly right ahead, what would be the proper course in that case for both ships?—The proper course? If you look at the great number of collision cases, you will see this: that whatever the screening is, or however it is arranged, a green light very nearly right ahead, or a red light very nearly right ahead are dangerous lights to alter the helm to. They both are exceedingly likely to change, and in truth such a light nearly right ahead is safer there than broader on the bow.

2587. But seeing the green light and not the red light in such cases, what action would you take?—"Stand by" to the engines, and possibly reduce speed. I would not touch the helm.

2588. You would not? You would go straight ahead?—Certainly.

2589. Then if you did that you would probably come into collision, would you not?—No.

2590. You would go very close?—No, I do not know any case where such a thing has happened; if the light does not change it moves away, and you are clear.

2591. You must do something to get clear of one another?—No, because to make a collision the ships must be very nearly on opposite courses, and very nearly on the same line; now that very rarely happens.

2592. That is what I presume. They are within 2°, or, say, a quarter of a point of ahead?—Yes, but the courses must be nearly opposite; that does not occur, that is a case you do not find.

2593. The Board of Trade people contend that if the fine screening were adopted it would exactly lead to what I have indicated, that, following the doggerel verse of "Green to green, red to red, perfect safety, go ahead," many officers in charge of vessels would simply do as you mentioned just now, continue their courses until they got too close for safety?—I think that is a pure fiction. There is no such thing in the record of collisions.

2594. It may be presumed that each officer in charge of the deck would starboard his helm, and thereby keep clear?—What generally happens before collisions in cases such as you speak of is, a man sees the green light nearly ahead, and starboards to give it a wide berth—not much.

2595. I say gives a little starboard helm?—Yes exactly, and then this follows: the green changes to red and he goes on starboarding or puts his helm hard a starboard, and then a collision ensues; or else he sees the red light nearly ahead or a very little on his port bow, and he ports to give it a wide berth, and the red changes to green, and he continues to port, and the collision occurs.

2596. I do not quite follow you. The particular case in point which I wish to stick to is, green to green, a quarter of a point on the starboard bow; you cannot see the port light in either case and you must do something to avoid a collision, because you are approaching one another very very close. If you do not come into collision, at any rate you go a great deal too close for safety. The position in that case would not give you a fair idea. He does not see the port light—he does not see both lights—he only sees the green light, he cannot run into the ship?—If he thinks his danger is great he should stop his engines or reverse his engines; he ought not to alter his helm because experience shows it is dangerous.

2597. Why should they not both starboard their helms?—No, because it is most likely if he does starboard his helm he will see the green change to

red; you cannot properly say "both," because no one has the control of both.

2598. I do not see how that could be?—It is a fact anyhow.

2599. (*Chairman.*) I will try and see if I can understand it by a couple of models?—I do not really know that models will help us, because I am only stating what happens.

2600. Would you mind just looking here. Now, what I think Rear Admiral Andoe is putting is this (*describing with the models*). Supposing you are on that ship, and have another ship very fine on the starboard bow, and you saw his green light, what should you do?—I should keep on and watch, and if I did not see the green light alter its bearing I should stop. If it did not then alter its bearing, then I should reverse; I should watch to see whether the green changed to red or passed away on the bow.

2601. (*Rear-Admiral Andoe.*) You are only seeing the green, not the red?—Yes, but the point is this: I know from looking into—certainly over a thousand collision cases—that I should expect to see that green change to red or pass away on the bow.

2602. I do not see why it should change. Supposing they both starboard just a touch?—Yes, but you have to recollect that the officer in one ship does not know what is passing in the mind of the officer of the other ship. That is his difficulty, you see only the green, but you cannot tell what the other sees, he generally sees what you do not expect.

2603. They each of them see the green?—But how can one know what the other sees?

2604. We will presume that they are fine screened. Take two large mail steamers coming down steering a very steady course, I presume that?—Yes, but then you must put your knowledge into his head, and you cannot, it is not possible.

2605. He only sees the green light?—Quite so; but you do not know that he sees it.

2606. (*Chairman.*) May I put it in this way; if the lights are screened fine, theoretically, these vessels being on exactly opposite courses and approaching each other 2° on each other's starboard bow, the result will be that each vessel will only see the green light of the other?—You know, as regards the question of the fine or coarse screening, it is merely in this case a question of whether the parallel and opposite courses are near or far from each other.

2607. Exactly; that brings us to the point; which do you think is the best thing, that the lights should be screened fine, or that the two lights should be seen at a larger angle?—I have not the slightest doubt that the fine screening would be right; although we say that A sees the green light of B, and that B sees the green light of A, because they are finely screened, and we say that would be different if they were coarsely screened, I say how do we know that? I do know this, for certain, that if they are coarsely screened A may very probably see the red light on his starboard bow; he may not see the green light, because it is not strong enough to show.

2608. (*Rear-Admiral Andoe.*) Then you presume that the green light crosses the bow. I presume, on the contrary, that it is a mere point of light, screened by a screen which is parallel with the line of the keel, and cuts the light off almost in a line with the light itself; it merely shows straight ahead, and does not cross the bows at all. I am giving you an extreme case of course. I will tell you why I ask the question: because the rule which sailors go by, we will say mates in tramps, is a rule of thumb; they do not argue these things out much; "green to green and red to red, perfect safety, go ahead," and he goes on his course. Whereas now, with the lights screened to 4°, they both put their helms a-port, and go away from one another. That is the reason I ask the question, because if they both saw the green light, I should say they would both starboard and go away; but at present it is not laid down in the rule?——

2609. (*Sir E. Harland.*) I think, Mr. Chairman, that Admiral Colomb told us that although they were green to green, and not red to red, they would both slow their engines, and then I think Admiral Colomb ultimately said he would see the red light. Now is that the point?—No, I hardly say that. My view is that we ought to limit the screening as much as possible, because the danger is, that A properly ought to see the green light on her starboard bow, but because the red light crosses the bow and shows, because it is more powerful than the green light, A only sees the red light when she ought to see both lights.

2610. (*Captain Castle.*) But under those circumstances would not A port, seeing the red light?—Yes.

2611. And then she would go clear?—No. For B only sees the green light and does not port.

2612. But then in fact, porting would show her red light?—You see I am not speaking in the least from anything theoretical. I do not believe in theories much

2613. I am speaking as a sailor; if you port you show your red light?—Yes, but if we look into collision cases, what happens is this: if ships are on parallel courses, and originally clear of one another, A, seeing a green light nearly ahead, we will say, gives a little starboard helm to give B a wider berth. B in the meantime has seen both the side-lights of B, because they are coarsely screened. B ports and A starboards. Then you have the collision.

2614. (*Rear-Admiral Andoe.*) That is exactly the case I mentioned just now. We will say *that* is a mail steamer steering a steady course down *there*. She sees a tramp yawing about as she comes along like that. They are showing their lights in *that* way. That is what they do in practice. *This* one only sees the green light, and, consequently, is inclined to give her a wide berth like *that*, but *this* one having seen both lights, ports her helm to go clear. They go like *that* because *this* one is fine screened, and *this* vessel has not seen her two lights (*describing*)?—Yes, but I do not think, whether screening is coarse or fine, you get the light; as far as I know, the more coarsely you are screened the worse it is; certainly in the Admiralty Court the cases show that that happened much more frequently when the lights were screened over 4° than it does now.

2615. I suppose that before the chocks were placed upon these screens that the angle at which the lights crossed was very much coarser than after the chocks were placed, speaking generally?—Clearly. My memory is bad for figures, but I think most of the ships I tested before there were any chocks showed 1 point on the wrong bow.

2616. Over 11°?—Yes.

2617. Have you any knowledge of how they were screened subsequently, at about what angle from the inside of the wick?—Well, I have only got what the Board of Trade were good enough to furnish me with when they recently examined, and of course it was varied; but the number of degrees was very small as a rule.

2618. (*Captain Thomson.*) I should like to ask you if you see ambiguity in the expression as applied to the side-lights "over an arc of 10 points from right ahead to 2 points abaft the beam?—I never did see any ambiguity about it until it was pointed out to me that in the Admiralty Court they did consider——

2619. I am asking you, sir?—It has been put into my mind that there was an ambiguity. I never saw it. I thought "right ahead" meant right ahead of the light, because otherwise the arc must be more than 10 points; from 2 points abaft the beam to right ahead must be right ahead of the light, not of the keel.

2620. Do you think that "right ahead of any point of the ship" is a line of direction parallel to the line of the keel?—I thought it applied to the light; taking the two things together, taking the arc they were supposed to be shown over, and that they are not supposed to show across the bow, and I thought it made it quite clear.

2621. Do you think that that holds good generally in a ship?—Oh, no.

2622. It would not hold good for a point outside the side-light if there was a point outside?—Generally. What you mean is, would I suggest a better wording? I should say it would be quite easy to have better wording.

2623. As the present rule of the road says that ships at night time are to alter their courses to starboard when they see the two side-lights of another vessel nearly right ahead, do you think it necessary that the screening should correspond with the proper limit to be given to the angle of nearly right ahead?—I am afraid I do not understand you.

2624. The present rule of the road enjoins that ships at night time are to alter their course to starboard on

*Vice-Admiral P. H. Colomb.*

22 May 1895.

approaching a vessel both of whose lights they see in the position which is nearly right ahead. That nearly right ahead cannot mean strictly right ahead?—No.

2625. Therefore, that difference between nearly right ahead and right ahead must subtend a certain angle?—Yes.

2626. Whatever that angle may be?—Yes.

2627. As that is a certain angle do you think that the screening of ships' side-lights should correspond with that certain angle?—No; but then, you see, I believe myself the law ought not to be as it stands. I believe the mistake is in the law.

2628. But assuming that we know the law as it is at present?—Then all I should say is, restrict the action of the law as much as you can; do not widen it.

2629. You would narrow the meaning of right ahead as much as possible?—Yes.

2630. But, having narrowed it, would you screen your lights to that narrow angle?—I should screen my lights without reference to that law at all.

2631. Then do you not think it possible that a ship may see only one light of another vessel which is nearly end on to her?—I should try to prevent her from seeing both lights.

2632. Then, of course, the port helm rule does not apply?—Quite so.

2633. In view of the law which defines an overtaking ship and a crossing ship on the starboard side, or defines the difference between them to depend on whether one ship overtakes the side lights of the other ship, so to speak, or crosses the angle of screening of the side lights abaft the beam, do you think it necessary that the side lights should be screened accurately to two points abaft the beam?—No, I do not. I should, perhaps, point out, as I said before, that all these questions with me are not theory. It is not the theory of the thing I speak of, it is always the practice; and I say this, that only 3·6 per cent. of the collisions happen between ships approaching from the same semicircle of the compass; the other 96·4 per cent. are where the approach is from opposite semicircles. Therefore, you see, I cannot lay any particular stress upon dealing with the overtaking clauses, because they do not really affect the safety of shipping.

2634. I think you said that when the screening became finer, or became, as you thought, parallel with the keel, that the port helm practically went with it or disappeared?—Yes.

2635. That was because if ship's lights were screened strictly parallel with the keel port helm would disappear entirely?—Decidedly.

2636. Ships meeting end on to each other one might port and the other starboard?—No, I would not put that, because they would have a greater chance of only seeing the right lights.

2637. I do not quite follow you there, because it seems to me that if the port helm disappears you have two remaining cases; one is where both starboard their helm, and the other case is where one ship starboards and the other ports?—No, it is not quite that; you become more sure of safety when you have port light to port light; when you know that the screening is narrow you are pretty sure that you are not looking at a green light as well but that it is not powerful enough to show, and *vice versâ*, when you see a green light on the starboard bow you are pretty nearly certain you ought not to be seeing the red; whereas, if you have coarse screening you cannot be sure. The safety signal is, of course, red light on port bow and green light on starboard bow.

2638. You do not attach any importance to the rule which makes two meeting ships alter their courses to starboard?—I think it was a bad law, because it was ruinous for years and years to shipping.

2639. The importance you attach to it is a negative one?—A negative one, because we have got clear of it very nearly.

2640. Do you know that with powerful electric light the screening at long distances can be made extremely accurate?—I suppose that would be so.

2641. And do you know that at moderately short distances the diffused light from the powerful electric light crosses to the extent of 8°?—I should quite suppose that, because that is the case with oil lights, ordinary lights, any lights.

2642. Suppose you had an electric light of 200 candle power visible at 600 yards to 8° of crossing beyond its screening line, and at, we will say, three miles distance, it is seen correctly screened, how will you reconcile those two differences?—You cannot. All one's experiments with ordinary lights show you the same thing, that, as you approach, a great deal of the secondary light, the badly reflected light, shows across; but the rays are not strong enough to show any distance.

2643. Do you consider the question of screening to be of most importance at long distances, or at moderately short distances?—I should think it was most important at long distances; but if you have lights that will show across the bow at short distances, of course there would be great danger, you know, in fog or misty weather coming close upon them and seeing the wrong light; but, on the whole, I should say long distance is the thing to go by.

2644. Yet is it not a fact that at long distances ships are able to watch the bearings of lights which will inform them of the course a vessel is pursuing?—Yes, exactly.

2645. But at short distances you cannot always do that?—Yes, but with screening at long distances, does it not follow you are pretty safe at short distances, except the case you have mentioned of electric lights?

2646. But in the case of oil lights you see them also diffused across the bows?—You do, but at such short distances that generally collision would then be inevitable.

2647. But the only difference in the case of lights which have a wick is, that the difference in the appearance of the light, between the screening line and the angle to which it is seen, is a gradual one?—Yes.

2648. You really cannot tell when you cross the screening line with a colza oil lamp—you cannot tell?—Quite so, because the light is only somewhat dimmer; it gets dimmer and dimmer as you get further from it.

2649. Whereas, with an electric light you may have a filament horse-shoe shaped, which may be turned in the fore-and-aft line of light, and be screened mathematically?—Yes.

2650. I find in my own experiments that at a distance of 600 yards, lights could be screened to 2 feet very nearly?—Yes; then I think that you could do that very nearly with a flat wick parallel to the keel, but then you lose light tremendously with that.

2651. Are you aware that in the case of the "Howe" cruising with the Channel Squadron in 1893, when she was exactly in line, right astern, at two cables' distance, neither of her side lights were seen simultaneously, nor could they be seen simultaneously from any part of the bridge by two different observers?—No, I did not know that.

2652. (*Sir E. Harland.*) That means there would be a dark lane.

(*Captain Thomson.*) Exactly.

(*Witness.*) I should like to add this, if you attach importance to it. You know that when ships of that size get within two cable's lengths of each other in most ordinary positions, collision is inevitable. There is a certain distance between the ships within which if you get, no power on earth will stop you, so it is no use you legislating for distances within which a collision is inevitable; you must be nine ship's lengths off as a rule, to be free to manœuvre. The moment you get within nine ship's lengths, then in certain positions, where you are not free to move, you will come into collision if you make certain movements.

2653. (*Captain Castle.*) That is four and a-half, do you mean, for each ship?—Four and a-half for each ship.

2654. (*Captain Hallett.*) You said you were in favour of drawing the line from the inner edge of the wick to the outer edge of the chock on the screen?—Yes.

2655. The fore and aft line?—Yes.

2656. And that was the position you put your lamp in?—Yes.

2657. Do you take into consideration the edge of the lens as well; would you also put the edge of the lens in that line?—No.

2658. Because the lens is cut and just takes the 10 points?—Yes, of course, it may or may not; I should

not agree about that, but the lens has got nothing to do with the wick.

2659. What I am driving at is this: if you made that line go through the inner edge of the wick, the inner edge of the lens, and the outer edge of the chock, then by having the wick in the centre of the lens, as it is supposed to be, you would also have your 10 points cut true with the outer edge of the lens on the side where there is no screening. Have you taken that into consideration?—As far as I know, if a lantern is properly made it ought to be more than 10 points, there should be a margin.

2660. No, it shows 10 points; practically they cut the circle into three, that makes 120°; then there is a certain loss from cutting and from bedding, and it cuts it as nearly as possible 10 points. You have not considered that?—Oh, yes, thoroughly. That question of cutting the lens is a very old one, and I thought we had really got over it, because if the lantern is properly made, and the lens is properly fitted with the wick centrally arranged with regard to the lens, the ray is radial, and therefore will not show beyond the 10 points, and you screen, not to the lens, which is beyond the 10 points, but to the wick, which gives it you exactly.

2661. But you would not insist upon having the inner edge of the lens also defined on that line?—Certainly not, clearly not, it must be more.

2662. It must be inside it?—Oh yes, certainly, it must be over that. There should be considerable margin of lens.

2663. Then you would insist upon your lens being more than 120° ?—Distinctly so, clearly.

2664. You have had a great deal of experience, and you have also made a study of the turning powers of ships under their helms, I believe?—Yes.

2665. With two biggish ships at a distance of half a mile, and running in parallel opposite courses and 4°, that is the angle of screening laid down, on one another's bows?—Yes.

2666. Do you think those ships could put their helms to port and turn towards one another without danger of collision?—Parallel courses?

2667. They are on opposite courses parallel?—Turning towards one another in *that* way (*describing*), clearly not.

2668. They are half a mile apart there. They pass if they continue their courses, at 180 ft.; do you think if they both put their helms down they would approach nearer than 180 ft. as a matter of fact?—It depends upon the sizes of the ships. It would be a mad thing I should say.

2669. You would not consider *that* in anything of a big ship of any speed to be a safe manœuvre?—Certainly not. I suppose you are alluding to one of my claims, that turning towards one another when in doubt is a safe thing?

2670. No, what I am alluding to is the paper which we have before us here, in which they advocate the screening of 4°; because if you screen to 2°, and let them go on green to green, or red to red, they pass within dangerous distances of one another. In fact, in some of these ships of 40 feet beam, with only 1° of screening they will actually collide?—Yes, but then the position is pure theory; there is absolutely nothing in it.

2671. But it is laid before us that 4° is necessary as an angle of screening to enable vessels to pass at a clear distance. Anything under 4° they say put your helm port to port and cross one another's bows. Do you consider that with big ships from your experience to be a safe manœuvre?—No.

2672. (*Captain Barker.*) You said just now that if you had two vessels like *that*, and there was coarse screening, that the red light would be seen before the green?—Might be. It was so in the case of the "Amazon."

2673. And that under those circumstances *this* vessel would perhaps get alarmed and port her helm unnecessarily?—Yes.

2674. But do you not think she would be able to tell which side was showing towards her from the masthead light. Do you not think it would give her the indication which way the vessel was going?—It might; but it does not. I really could not answer such a question.

2675. At two miles that angle at 40 feet would be quite distinguishable; the angle between two objects at two miles, we will say of 20 feet even, will be quite distinguishable?—My impression at the moment is that it is not so. There is not that guide.

2676. You think not?—Those are things you have to think pretty hard about. In the very early days, in 1864 and 1865, there was a great struggle made to arrange the side lights and the masthead light so as to do all that kind of work. But it did not come to anything really, and as a fact it is not so. As a fact, when lights have been mistaken I think that they do not take the masthead light into account; when they get the red light a little on the port bow, a ship nearly always ports.

2677. It is quite possible, I am telling you this as a fact, to distinguish a red and a green light, which are only one foot apart, and are very carefully screened at three quarters of a mile. You can see those two lights distinctly, quite separate from one another. You can see the black space between them?—Yes, it depends upon the power of the light. They must not be very powerful.

2678. Yes, I am speaking of oil lamps?—I have always found that 6 feet was the least to make sure of separating the lights at 2 miles distance.

2679. Of course, we know pretty well that the majority of lights were formerly screened coarser than 4°. That is to say, the angle of screening was rather larger before than 4°. Do you think the finer angle has decreased the number of collisions?—My impression is that the fine angle must always tend that way.

2680. That it has already made a difference?—Well, I do not know, because I have not looked lately. But certainly collision from wrong port helm has decreased since the chocks were introduced.

2681. (*Captain Castle.*) You say it takes a long time to think about this question of the masthead light and the side lights. If it takes you a long time to think about it, what must it take a master on the bridge when he sees another ship?—That is quite true. I do not like the masthead light, you know.

2682. Because it is much easier to do it here than at sea?—Much easier.

2683. In reference to the green light ahead, she is probably crossing, if you see nothing but the green light, and of course, if so, you rapidly change your bearing (*describing with the models*)?—Well, you do.

2684. If she is crossing you must change your bearings?—No, you may not change them at all, and still be crossing. It depends upon your relative speed and the relative distance from the crossing point.

2685. But, at the same time, if you saw no change in the bearing, would you not starboard?—No, I should not.

2686. Not to a green light ahead?—Not immediately, because I should be breaking the law, should I not?

2687. No, I think not. You are not bound to port if you see a green light, and there is no law about starboarding for the green?—Yes, but I should not like altering my helm when I was already safe.

2688. And you say you are safe so long as you see the green?—Yes, when ahead, because you must generally expect to see it change to red, or to pass away to starboard. Therefore it is dangerous to alter the helm.

2689. It is dangerous to starboard, you think, in case the other man ports?—Dangerous objects when you are under way are safer right ahead than anywhere else. It seems ridiculous, but it is so.

2690. Not to remain ahead?—No, but they would not remain ahead.

2691. Of course if you alter your bearing it is all right, though if it remains ahead it is not?—No, but then you have your warning. Nothing does remain ahead; it changes.

2692. (*Chairman.*) That means that when right ahead it is in a condition of getting into its dangerous position?—Yes. Your least danger is right ahead, the risk on opposite courses on the same line is merely the beam; the risk when the courses cross at right angles is twice the length of either ship.

2693. (*Mr. Bolam.*) You said some time ago that in regard to preventing collisions at sea there was a

*Vice-Admiral P. H. Colomb.*

22 May 1895.

mistake in the law—it is your phrase—the law, I understood you to say, was badly put, or inaccurately put?—I said the law was very defective in 1867, and it was in consequence of that defective rule, partly, that the "Amazon" and the "Osprey" were lost.

2694. I understood you to refer to the statute itself, and not to the Board of Trade instructions to carry out that statute, it was in reply to Captain Thomson?—I was specially referring, not altogether to the statutory law but to the interpretation which the Courts put upon it. The Courts at that time declared that "nearly end on" covered a difference of two points in the courses.

2695. Can you tell us how the Admiralty screen their lights?—I do not know—I cannot.

2696. When you have two vessels on parallel courses, and very little on each other's starboard bow, you distinctly object to anything being done with the helm right off?—You do not put the question so that I can answer it from my point of view. I cannot think of *two* ships acting. I can only think of each ship acting separately according to what she sees, and *thinks the other sees.*

2697. Then I put the question in this way: If each ship sees the green light a very little on the starboard bow you object to the helm being what you term "fiddled with" in too great a hurry?—No, again I cannot see it from your point of view. You put the two ships. I cannot go beyond the one ship. I cannot tell what the other ship sees.

2698. Then, if I were your junior officer, and I saw another vessel's green light a very little on my starboard bow, what would you expect me to do?—I should expect you to do nothing.

2699. You would object to my "fiddling" with the helm?—Yes.

2700. You would expect me to wait and see what I could find out. Of what?—Of the movement of the green light.

2701. Of the possible change of bearing?—Yes.

2702. And if I found out that that green light was getting broader on my starboard bow, what should I do?—Leave it alone.

2703. And if I found that the bearing was not perceptibly changing, what should I do?—Give the order to stand by to the engineer.

2704. And if I still found that the bearing of the green light was not perceptibly changing?—I should be inclined to stop and reverse. I should be very cautious with the helm.

2705. Should you starboard the helm at all?—I do not think I should in the case you mention.

2706. Do you attach any importance to the doggerel rule, "Green to green, red to red, perfect safety, go ahead"?—I think it is dangerous.

2707. Then you have never believed in it?—Never.

2708. And do you think that the screening of lights to 4°, assuming that that is a larger angle of screening than has hitherto existed, would be in the direction of conserving that rhyme, which the Board of Trade seem to think is a valuable one? Would the screening of the side-lights to so broad an angle as 4° be in the direction of conserving that rhyme, supposing it were of value?—No, it would be the other way, because of course you might be seeing the wrong light. There would be a greater chance of seeing the wrong light.

2709. Do you think the greater danger is, as you put it in your examination-in-chief, showing one side-light on the wrong side of the ship?—Yes.

2710. (*Mr. Scrutton.*) You attach a great deal of importance to the examination, which appears to have been a very careful one, of the proceedings in the Admiralty Court?—Yes.

2711. Have you found any difficulty in consequence of the conflicting evidence which is constantly given. How have you dealt with that?—Conflicting evidence is comparatively rare. But when it seems so at first and I have given them time enough and pieced it out carefully, and reflected that sometimes one witness is bearing testimony to what happened a few seconds later than other witnesses on the other side, I often find it quite easy to piece the whole thing out. But as a rule, the evidence fully accounts for the collision.

2712. Then your opinion is arrived at in consequence of the opinion you have formed from the contradictory evidence?—No, I do not think I can quite put it in that way. You find certain things; you find in the record of collisions where lights are concerned, there is never collision without porting to the green light or starboarding to the red light. That is to say, where there is not disobedience, distinct and clear, to the signals made by the lights. You prove the case by showing that from the laws governing ships in manœuvring, the movements in question ought to make collision as it is represented to have taken place.

2713. Do you not think it possible for another man, looking at the same set of contradictory statements, to come to an entirely opposite opinion?—No, I say that because another mind (Admiral Brent's) was occupied with mine originally and did not see any difference.

2714. Do you attach any importance to the masthead light and side-lights being required to be put in certain relations to each other?—None at all.

2715. Why not?—Because the avoidance of collision is a perfectly simple thing. To avoid a collision when both ships are under way, you must either do nothing, or else turn towards the danger. No amount of arrangement of mast-head lights or anything of that sort will alter that. All you do want to know is the danger signal.

2716. But would you not admit this; that if the mast-head and side-lights are in a certain relation to one another, as the vessel moves one side or the other those lights are seen in a different position by the opposing vessel?—Yes, I think that is so, and I think possibly at very close quarters, in rivers and so on, where the rule of the road cannot be obeyed because "keeping out of the way" devolves on the ship which by law should keep her course, advantage will sometimes be taken of that, but I do not think to any great extent.

2717. Let us take this: here is an absolute illustration of a vessel that is made to scale. The only thing I am not quite sure about is the mast; but *that* vessel now is directly in a line with your face (*placing a model*)?—Yes.

2718. Is there not a very perceptible difference now (*describing*)?—Of course we have the motion of the ship using her helm, which you do not have when you are showing a single light.

2719. But do not those lights now present themselves to you as the vessel is now in *that* direction, in a very different position to each other?—I quite agree, of course.

2720. And of course *that* way as well?—Yes, quite.

2721. If it were a matter of legal enactment that those lights must be in a certain relation to each other; would not that be an indication to you as to which way the vessel was moving?—Yes, no doubt; but then I do not know that if you had that it would make much difference in the number of collisions.

2722. I only want to get at the fact?—It is clear of course that you get the movement of the ship.

2723. (*Sir E. Harland.*) To follow that point which was put before the Committee the other day. Some of the evidence we had went in this direction: that if, for instance, a vessel were lying off waiting for the tide, and you saw a steamer ahead which was just as likely to be going dead slow, and you saw practically nothing but the green light, and you watched that light, you really would not know by her movements, as she was making very little movement in the water, what course she was steering with regard to you; being, as it turned out in this instance, that this vessel was lying just across your bow. Now if that ship was required to have the mast-head light and side-lights relatively to each other at an angle of 45°——

(*Mr. Scrutton.*) That model is 45°.

2724. (*Sir E. Harland.*) Very well. If you saw that and you knew that it was an intentional arrangement that the lights should be so fitted, would you not be able to conclude that *that* vessel was exactly at right angles with your course (*describing with the models*)?—Clearly.

2725. Then, on the other hand, supposing you saw the green light almost exactly behind the mast-head light, which is now so with *this* vessel, that *that* vessel is almost exactly end on to you?—Yes.

2726. Then would it not be an advantage to you to know the relative position of that ship to you?—In narrow waters, as I said before, all those indications of movements are good, but in the open sea, where the

disastrous collisions come about, when you are both at some speed, you do not really require those sort of things.

2727. Then suppose we take an intermediate position. *There* again, you see, is an angle of half that 45°?—Yes.

2728. Then you would be able to conclude that *that* vessel was steering a course quite clear of you (*describing*)?—Yes.

2729. If, then, you had those three points clearly indicated by this arrangement of the lights—*that* one meaning that the vessel was lying across your bows; the other at an angle of, say, about 45°—if she were under weigh at all, and that she was steering quite clear of you; and, on the other hand, if the lights were relatively almost in identical line with each other, that her bows were dead fair, or nearly so, for yours?—Yes.

2730. Then although such an arrangement of sidelights does not exist, and although you told us that some few years ago there was a strong effort made to that effect which somehow or other fell through, do you think the idea is one which has no bottom in it, and is not worth while considering again?—Well, as I said, every arrangement of that sort is good for close quarters in narrow waters and so on; but I think if you are going to do anything of that sort you had better do it in the simplest way. The simplest way, as far as I know, is by getting rid of the coloured lights altogether, and enacting that every ship shall carry two white lights, say 10 feet apart, at an angle of 45°, and let them show however they like to show. You then get all the movements perfectly clear with only two lights, those two being white lights. If I thought it important, I would rather advocate that.

2731. Am I to understand that your suggestion is do away with coloured lights?—Yes.

2732. Then it would mean that you would have another light above this 10 feet?—No. May I show it to you here? You know if it is necessary—I believe it is not—to show all these manœuvres you suggest, then I think the simplest way is to put two white lights 10 feet apart on a stay set at an angle of 45° to the horizontal; those two lights will show you all you are asking for and will give you every movement. Their angle being a fixed one, and their distance a fixed one, you will get the course and movement by the apparent angle; and the distance by the apparent distance. But I do not lay any stress upon that, because, as a fact, if we could get seamen to leave off turning away from an apparent danger, we should shop collision.

2733. Then on a steamer you would have a light at the masthead, and another one arranged on the forestay, but would it be possible for the same to be shown on a sailing ship and not be obstructed by the canvas?—Yes, I think so, because they need only be very light lanterns.

2734. If you were abeam of that sailing ship, how could you see the bow light?—The sails would hide it when you got abaft, no doubt.

2735. Then do you think they would not be so easily seen as the lights which are now in a sailing ship?—I think they would be generally as visible as the coloured lights are in sailing ships.

2736. Would you think that preferable to having a second red light at an angle of 45°, one above the other, 8 or 10 feet?—You see my aim has been from the beginning always to simplify matters. I have always been dead against any increase in the lights, or any fresh regulations with regard to the lights. I had hoped we should keep clear of them.

2737. Referring to the matter of the screening; I think your memory goes back to the time when the side light was merely shipped alongside the screen, and there was no chock on it?—Yes.

2738. Then by that arrangement would you say—no doubt you would—that the angle of the light crossing the bow was very much greater than it was afterwards when the chock was fitted?—Clearly.

2739. Do you remember whether under those old conditions there was any very serious complaint made as to the light crossing the bows at such a coarse angle?—No, no one then perceived the danger; I was the first to draw attention to it.

2740. Then some two years ago the time came when the Board of Trade went into the matter somewhat, and first fixed the chock, the object of that being to reduce the angle across the bows; you are aware that there was a great diversity amongst the different ports in the country and amongst the different Board of Trade surveyors, as to the precise angle at which these chocks were arranged?—Yes, but the chock began to be fixed in 1868.

2741. And varieties of lamps so fitted to the same screen?—Yes.

2742. Do you think there is any special reason for the shipowners generally to have complained with such unison of the recent action on the part of the Board of Trade; do you think that there has really been an increase in the angle on an average, or a reduction, or do you think it is only what the Board of Trade discovered to be the custom in different parts of the country?—From my point of view I do not think the shipowners need complain in the least. Of course, I should think every shipowner who had the lights screened on the old plan would object to the expense of screening on the new plan, but that is as far as his objection would go. I do not think the angle of 4° is any particular increase, I doubt if it is any at all, on the old practice; but, on the other hand, when Sir Digby Murray was good enough to give me the evidence upon which he was acting to revise the method of screening lights, I said, "Well, if that evidence had come before me I should "have said let well alone. After all, the great mass of "lights you have examined are very fairly screened and "it would be comparatively easy to draw a surveyor's "attention to one case where it turned out that lights "were not properly screened." But I cannot lay any very great stress upon any part of this question now, because, as I stated in my answers to the Chairman, the fact is that, however it has come about, the dangers which did exist from bad screening have to a great extent passed away, even before the Board of Trade took this latter action.

2743. In other words, you would have thought it more politic had the Board of Trade not formed this wholesale determination to reduce the limit, but had gradually done it in the most extreme cases, and you think by that that shipowners and nautical men would not have seen that there was any very great force in getting their attention drawn to it?—Yes, I think that would have been so.

2744. And that gradually the change might have come about without any public excitement or public protest?—Yes, but I never should have gone beyond the instructions to the surveyor, never; because, after all, the thing was working very fairly well.

2745. You referred to the owners objecting to the expense of altering the screening, but I presume you recognise that the mere cutting down and doing a little bit to the chock at the end of the screen is only a question of a few shillings; I presume you do not wish to make the shipowners appear so parsimonious that they would hesitate to do anything for the safety of the ships?—No, if they were convinced that it was a matter of great concern, it might be so; but I think as a shipowner I should have been worried, when my lights were already properly screened, if I had to comply with a fresh unimportant rule, and had to get carpenters in to make alterations, and I should have grumbled.

2746. You think the ship's carpenters could not have done that?—I do not know, but I should have grumbled.

2747. (*Mr. Scrutton.*) Do you think it at all worth while to bring the green and red lights into such a position that they are seen at even distances? At present, you know, it is quite admitted that they are seen at uneven distances. Do you think it worth while giving attention to that matter?—My original impression was that the Board of Trade might very properly have produced pattern lights; not perhaps to have enforced them, but to have erected, as it were, a standard, getting the best information they could, employing the most scientific men in preparing lights, and that would include what you say. That is to say, the green light would have a more powerful flame than a red light, so as to bring it up, if possible, to the power of the red light.

2748. That could be secured by making the green a duplex light, and the red a single light?—Something like that.

2749. There is one other question arising out of Sir Edward Harland's questions; you do not appear to

*Vice-Admiral P. H. Colomb.*

22 May 1895.

attach much importance to the question of whether the light is screened at 4° or 2°?—I think it is worse when screened at 4°, but you must recollect the Board of Trade's screening here is from the outer edge. I do not know whether you could screen the outer edge to 2°. Perhaps not, with a very wide wick.

2750. The figures before us, which you may accept as correct, are, that in a vessel at 2 miles, with a screening of 4°, and a beam, I think, of 50 feet, the field—which we call the part after the rays have crossed—the half breadth of that field, would then be 800 feet at 4°. If it was 2° it would be half. Do you not attach importance to the question as to whether at 2 miles both lights can be seen within 800 feet or 400 feet of a central line?—I should rather not see both of them at all, but of course the narrower the field the better it would please me.

2751. (*Captain Thomson.*) I think you said that if the limiting angle of right ahead was narrowed to any angle it was not necessary to make the angle of screening correspond with that?—Quite so.

2752. Assuming, merely for the sake of putting my view of it, that it would not do to narrow the limiting angle of right ahead less than half a point?—Yes.

2753. And say that we screen a side-light to very fine screening, of 1° or 2°?—Yes.

2754. I should like to call your attention to this. *Here* is a ship which sees exactly ahead of her a green light, owing to fine screening?—Yes.

2755. Owing to the limiting angle of right ahead, this other vessel sees the first ship's side-lights at an angle within the limiting angle of half a point?—Yes.

2756. According to the rule of the road this other vessel is bound to port?—No.

2757. Why not?—Because she has got him on the starboard bow; not end-on or nearly so.

2758. But assume that is an angle of 5°?—I could not follow you into niceties like that. They do not exist in practice.

2759. We will make it a point for the sake of illustration?—Perhaps I do not quite gather what you mean.

2760. The lights are screened on both ships very fine in a line parallel with the keel; but the limiting angle of nearly right ahead is 5°; I am laying down the law now that she has to port. There is no doubt about that. But *that* ship, owing to the fine screening, opens only one light and stands on, according to the rule of the road?—Yes.

2761. You see that is a contradiction of the rule of the road?—Yes, absolutely; but it would be the rule of the road that was wrong.

*Capt. S. R. Chandler.*

Captain Samuel Rock Chandler called and examined.

2762. (*Chairman.*) I think you have been at sea for 25 years, have you not?—Yes, 25 years.

2763. Have you been in cargo steamers; if so, for what period?—I have served since 1879.

2764. What office have you held on cargo steamers?—I was second mate, mate, and afterwards master.

2765. Speaking generally, what has been the sort of sized steamers that you have been connected with?—The smallest, I think, that ever I was in was 790, and the largest 2,200 registered tonnage.

2766. Have they been engaged in trade pretty well all over the world?—All over the world except the West Coast of America.

2767. Before 1879, I think, your experience had been with sailing vessels?—Yes.

2768. You have been a master, I think, since 1884?—Yes.

2769. I should like to ask your view upon this subject of the screening of the lights. First of all, with regard to the Board of Trade rule of 4°; I should like to know what your opinion is upon that subject. Do you think that that rule enjoining screening at an angle of 4° from the outer edge of the wick is a desirable rule or not?—No, I think it is too much. It is not desirable.

2770. Have you formed an opinion what angle of screening would be desirable?—I should say that if the light was screened about the middle of the wick it would throw the light at a sufficient angle across the bow, and at the same time not be dangerous.

2771. Before the Board of Trade rule requiring the 4° came into force, what, as far as your experience goes, do you think was, in practice, the sort of angle at which vessels' lights were screened?—I was in a vessel—I should say I never tested it exactly—but, speaking roughly, both her lights were visible at a point at the very least on the opposite bow when she came away from the building yard.

2772. Screened a point across?—Screened a point across. The screens had no chocks in them; no cleats or chocks—whatever you like to call them—and they remained like that for about six months, and I altered them.

2773. Of course that was a strong case?—But from what I know about merchant steamers, I should say they were screened all ways, anyhow. There does not seem to have been any fixed rule about them, or any angle at which they were screened.

2774. Take your own vessels; what do you think their lights were screened at generally—4°, or more or less?—No; they were screened at more I should say Oh, yes, more than that.

2775. I rather gather from what you say that you did not pay any very special attention to the exact angle at which your lights were screened?—No, until 1892.

2776. And I suppose that applies pretty well, as far as your experience goes, to other masters of similar vessels? It was pretty general, I think; I suppose they did not pay particular attention to the angle of screening?—I do not believe they did; so far as I know they did not.

2777. So that when you saw another vessel at sea you did not form, in your own mind, any very special idea as to how her lights would be screened?—No.

2778. But now, when you come to think over it, you think 4° is too much?—4°, I should say, would be too much; that is 4° to each light, of course, you mean.

2779. 4° from the outer edge of the wick?—Of each side; yes. Yes, I should say that would be too much.

2780. Of course, if you screen from the middle of the wick that would give, taking it from the outer edge of an ordinary 1-inch wick, something like 1° or 2°?—Well, perhaps 2°, between 1° and 2° I should say; and the point of contact of the rays of lights on different sides, when the light was screened in that manner, I should say would be quite near enough to a vessel for all practical purposes, and, at the same time, not misleading.

2781. Why, if you have thought the matter over at all, do you think that a finer angle of screening than 4° is better than an angle of 4°?—You ask why I think an angle of 1° is better than an angle of 4°?

2782. Yes?—Well, because the light on one bow is not visible on the other bow so much.

2783. You mean that they do not cross?—Yes, they do not cross. You see, the further you get away from a vessel with crossing lights the greater the extent of the arc becomes through which the light is visible on the opposite bow, and it is in cases where a vessel is at some distance off where the excessive crossing of the lights is apt to lead to mischief.

2784. You understand, of course, that if the lights show right ahead some of the light must, to some extent, cross?—There always will be a certain amount of crossing.

2785. Then is it your view that the crossing should be as little as possible?—As little as possible.

2786. Now, as to the dark lane. You know it is suggested that if the lights are screened strictly so as to show only right ahead of the lamp there would be what is called the dark lane. What is your view about that in practice—is it a thing that is likely to exist?—No, I do not think so. You could get a dark lane if you had a screen 40 or 50 or more feet in length, but with the ordinary 3 foot screen I do not see

how there could be any dark lane. I may tell you that on one occasion after 1892, the first experiment which ever I made about lights was in the case of a steamer in which I was then, called the "Fastnet." She had her side-lights under the bridge on each side, and these lights were screened—they had the wooden chocks at the fore end of the screen, which were the same thickness as the framework of the lamp. I do not know whether I am making myself clear to you.

2787. Yes?—The copper framework of the lamp—the inboard framework of the lamp—was the same thickness as the chocks on the forward end of the screen. Standing on the stem with both those lights lit you could see both clearly on the stem, which was, I suppose, about 120 or 130 feet away from the lights.

2788. So that in that case there would be absolutely no dark lane at all?—No; but then they were not screened right ahead, because the angle was made by the screen on the other bow; the angle of the crossing was made by the wick and the chock; a line from the wick passing the outer edge of the chock and continued over the bow would give the line of crossing on the opposite bow; that was considerable.

2789. I think you attach importance, do you not, to a compliance with the rule that the lights are to show to two points abaft the beam?—Yes, I do; I think there has been little or no attention paid to it.

2790. Practically you think it is of importance that the lights should show 2 points abaft the beam tolerably accurately?—Yes, I think so.

2791. Is that with a view to understanding your position when you are an overtaking vessel?—That would be one reason. It is also an approximate guide to the direction in which ships are steering.

2792. In steering your ship, take for example the sort of vessels that you have been connected with, what are the limits of deviation of the yaw of the vessel as she steers, do you think?—Well, it will alter very much under different circumstances.

2793. What difference would you allow with good steering?—In bad weather, with a steering engine even, a laden cargo steamer can hardly be kept within less than a point each side of her course in a heavy gale of wind, running before a heavy gale of wind. If you keep her within a point on each side of her course you do very well. I never object to a helmsman with that; of course, in fine weather and smooth water, and with a steering engine, you can keep them within a quarter of a point or less; a good helmsman would keep her within a degree or so.

2794. And even with the lights screened finely a vessel would be apt to show the lights one side or the other?—Yes, with yawing you are bound to show that. I have noticed it with some of the fastest fine-bottomed vessels like the P. and O. and the Messageries Maritimes of France. You always see them moving a little one way or the other.

2795. When you see that at sea, when a vessel is perhaps following you or even approaching you and showing the light first one side and then the other, do you recognise that as the effect of yawing?—I do not know what else it could be. It could not be anything else that I am aware of.

2796. Would it be tolerably quick. Would you see the alteration of the green and red lights quickly?—No, not with an oil lamp. You do not see one light and then instantly lose sight of it and at the same time get hold of the other light. You would see in very fine weather one light gradually get a little dimmer, and then, perhaps, disappear altogether for a short interval, and then another light come into view. Of course there are times when you see both lights. With the electric light it is cut off much quicker. You lose sight of the electric light almost instantly.

2797. So that, supposing you saw a vessel coming on with her lights screened fine, and then saw first one and then the other through the vessel's yawing, that would not be a thing that would puzzle you?—No, not at all.

2798. Do cargo steamers often have much of a list either to port or to starboard?—They do sometimes.

2799. I suppose unless the lights are hung so as to swing the amount of light which is shown by the lamp on the side on which she is listing is affected by it. Have you noticed that?—No, I do not see how it would.

2800. The flame of an oil lamp remaining always upright, if the vessel is listing to any extent part of that light, I suppose, may be obstructed, may it not?—Yes. You would want a tremendous list to make much difference.

2801. You do not find it is so practically?—Practically I would say it would amount to nothing. In a vessel with a list of 12°, which is a very heavy list, it would not make very much difference to the flame, especially if you take into consideration that the draught which causes the thing to burn, especially if it has got a chimney, is always going up in the direction of the chimney, and the perpendicular of the chimney changes with the plane that it rests upon. Even without the chimney the draught has a tendency to run up through the top of the lamp.

2802. Is the electric light coming into use in cargo steamers?—To a good extent it is, but nothing like what it is in the case of the large steamers, the liners. They all have it now.

2803. Do you think the electric light will before long, come into use in cargo steamers of the ordinary type, big steamers I mean?—Yes, I think so in the large ones, the heavier ones I think it will, because it affords a considerable amount of convenience for working at night in winter in port. That is the principal reason why they will use it, because they can work in the short days and the long nights in Europe in the winter, where it is impossible to work always between sunset and sunrise if you have not got the electric light.

2804. (*Rear-Admiral Andoe.*) Cargo vessels yaw a good deal at sea, do they not?—Yes.

2805. Say a point either way in bad weather; suppose you see a vessel of that description approaching you?—Yes.

2806. And you see practically her two lights, it may be a point on either bow, but in consequence of her yawing she may show you first one light and then the other, but practically they are blended, and you may say there are two lights ahead of the ship?—Yes, I quite understand what you mean.

2807. Seeing the two lights ahead of you or nearly ahead, what would you do in your ship—what is the rule of the road?—Pass her on the port side.

2808. Port your helm?—Yes.

2809. Considering that vessels of that description yaw a point either way why do you put so much stress upon the fine screening of the side-lights; what difference could it make to a vessel of this description?—The less liable we are to be misled by the yawing; the finer the lights are screened the less liable you are to be misled by the fact that the vessel is yawing about.

2810. Do you consider that the side lights should show as brightly ahead as, we will say, 4 points on the bow?—Yes, I do not see why they should not.

2811. You would not like to arrange the screen so that it should cut off the power of your bow light at all from ahead, would you?—No.

2812. You would not like to overlap the light with your chock so as to reduce the power of the light right ahead, would you?—You would not be overlapping the light by screening it parallel with the centre of the wick.

2813. You would wish to have your lights show, at any rate, right ahead, the full light?—Yes.

2814. Have you ever seen the dark lane at sea in ships?—No, I have never seen it.

2815. Does that not point to the fact, probably, that the lights have always crossed at an angle?—Yes, that they do cross, that they always have crossed.

2816. Previous to this new regulation of 4° and this question having arisen, did you fully realise the fact that the lights did cross the bows of the ship?—Oh, yes, I was quite well aware of that.

2817. Supposing that very fine screening were ordered, we will say to a line parallel with the keel as you suggested just now, and suppose a mail steamer coming down only 2° on your starboard bow showing her green light nearly ahead; you see nothing but the green light in consequence of fine screening with the electric light, because you have said just now the electric light cuts off very quickly, and you show to her both lights in consequence of yawing? What would you do to follow the rule of the road or to keep clear of that vessel?—She is showing me her green light only.

*Capt. S. R. Chandler.*

22 May 1895.

2818. Only her green light, and nearly ahead, but you can tell she is coming down upon you?—And we are showing her both.

2819. Yes, because you are yawing?—Of course, I am not supposed to know what I am showing; I only see her green light; it all depends where her green light is, which bow it is on.

2820. Take it within 2° or 3° of the bow ahead of the ship?—On either bow?

2821. Yes?—If it was on the port bow I should go on.

2822. (*Chairman.*) If it was on the starboard?—If it was on the starboard bow, and I thought we were going to pass her too fine, I would probably keep away, and get on her starboard side a little more.

2823. (*Rear-Admiral Andoe.*) A little starboard helm?—Yes, a little starboard helm.

2824. What should you do supposing you saw both lights coming towards you?—Port the helm.

2825. Then you starboard, and the other ship ports her helm?—Yes, but I do not see how that could ever occur. It may be the case in theory, but it never is so in practice. If the steamer that was showing me her green light was coming down nearly ahead of us, and it was simply owing to her fine screening that I only saw at one time, say when I first saw her, her green light, she is sure to show me the other before very long; then I would know she is coming down in the opposite direction to me, and nearly end on.

2826. Do you think that that fine screening would entail more discretion being left to the officer in charge of the deck, the mate, for instance, instead of his following the old rule of thumb to port the helm?—It would have that effect, that if the light was more finely screened they would not attempt to go as close to a vessel as they do now, that is, being guided by the light alone.

2827. But in the instance I pointed out just now of the mail steamer coming down, steering a very steady course, and finely screened, you only see her green light, but she sees both your lights in consequence of your yawing; she is bound to keep clear of you by the rule of the road, but you do not see her red light until she begins to port, and you go off under the starboard helm to give her a little room?—You are assuming a case which I do not think exists.

2828. You do not think it is possible?—No, I can quite understand that contingency if the lights only had screens on them so long that the actual line of crossing—because there must be a line of crossing somewhere—was beyond the illuminating powerof the lamp. You could have that contingency then; but I do not see how you could have it with 3-feet screns.

2829. In the case of mail steamers lighted with electricity and coming up astern, do you often see one light when they are coming up astern within a few degrees of your course, or do you see both lights?—That simply depends upon how she is coming up. If she is coming up right astern we see both lights, and if they yaw a little we see one or the other.

2830. Take half a point on the port quarter?—In fine weather they would probably show their green light steadily.

2831. The Board of Trade officials say that if the light was screened more finely than 4° these vessels on passing, instead of porting their helms and going clear of one another on the port helm, would be too close, if they followed the doggerel rhyme which says "Green to green, red to red, perfect safety, go "ahead"; and that rhyme I suppose is the rule of thumb which a great many of the mates on your class of vessels would follow, would they not?—You must bear in mind that there are times when you see a green light on your starboard bow, and common prudence and instinct tell you that if the two vessels continue on the same courses they must come into collision, or so near to it that the risk is not worth running. The consequence is that one or both make an effort to get out of the way of the other. You can have vessels coming with their green lights, showing to each other and they will hit one another's lighthouses.

2832. But if you had this very fine screening you could not allow the rule of the road or the rhyme to be considered as "perfect safety"?—I do not know; the rule would be the same as it always has been. That would be just as true with the lights not screened so much across the bows.

2833. But now that the screens are fixed at 4°, if you pass in that manner, green to green, and red to red, and follow your courses, you each pass a considerable distance from the other?—There is no probability of your seeing the crossing light when you are green to green or red to red. If two vessels, each on the other's starboard bow ever so little, are showing each to the other their green lights, the amount of crossing that the lights have has nothing to do with it. If they have the other the least bit on the bow they must be beyond the parallel line of the lights and crossing does not come in then at all. The risk in crossing is not seeing the green light under those conditions but seeing the red one too.

2834. If you saw her green to green, you would, I presume, naturally, as a seaman, starboard the helm and give a wide berth, but the danger, I take it, would have been if one saw both lights and the other only saw one?—That I believe, as I said before, is a contingency that is never likely to arise. I do not see how it can in practice.

2835. (*Captain Thomson.*) From the point of view of the smaller class of vessel, when you have small vessels whose lights you would probably not see more than a mile in ordinary weather, do you consider it advisable that large and fast steamers should carry very powerful lights?—No, I believe it would be an advantage if there were some standard amount of light given which vessels should use and not go below or above.

2836. You see no practical advantage in seeing a steamer's side-lights distant, say, five or six miles in ordinary weather?—No, I do not see that there is any advantage in it; under certain circumstances it might be misleading. It is so with the electric light.

2837. You think the glare of these powerful electric lights is often the cause of making the other inferior lights less distinct?—Yes.

2838. As regards yawing, take a fine summer night in the channel and smooth water, would you see any perceptible yawing in the ships that you meet?—Some of them, yes. I have been in cargo steamers that two men could not steer by hand within a point and a half on each side of their courses in the smoothest water. Those are, of course, exceptions.

2839. They are steering their best; but in smooth water they oscillate, so to speak, a certain angle, say half a point on either side of their courses?—Yes.

2840. Can you give me any idea as to what length of time it would take to complete one of these oscillations, that is to pass from one side of the course to the other and back again?—The "Fastnet" was a very bad steering vessel, and in smooth water, say a calm night, with no other influence except her propeller and rudder, she would make an oscillation of half a point on one side or the other, when steered by an engine, about every three or four minutes.

2841. Supposing it was a very long powerful mail steamer, she would probably not oscillate so much as that. Do you think she would take as long a time to oscillate, supposing she was going 18 knots?—No, I believe she would oscillate more rapidly. My experience of fast steamers is almost nothing; and I am only saying this from seeing them coming up astern.

2842. You think that an oscillation of about half a point each side would take four minutes?—About four minutes; every four minutes.

2843. Do you attach any importance by day or by night to the rule of the road which compels meeting steamers to alter their course to starboard? By meeting steamers I mean end on?—Yes, I should think so.

2844. In other words, if the rule was blotted out, should you think it a good or a bad thing?—I should think it was a very bad thing, unless they made a rule to pass to starboard. They could alter it if they liked, but they must have one side to pass on.

2845. Then you do attach importance to it. You think there should be a definite rule?—There should be a definite rule on which side each should pass the other.

2846. (*Captain Castle.*) I suppose the oscillation depends to a great extent upon the helmsman: yes; but I was speaking of a case just now with a good attentive helmsman.

2847. There is a good deal of difference in the helmsmen?—Yes.

2848. One man has his head in the ship's compass, and the other one watches the ship's head?—Yes. I believe that in all steamers there must be a certain amount of oscillation. It is practically impossible to get her right on her course, no matter what it is.

2849. I suppose, in your opinion it is necessary that there should be an uniform screening in all ships?—Yes; that is the great disadvantage of the rule in vogue at present.

2850. (*Mr. Bolam.*) What ports are the ships that you have belonged to registered at?—London.

2851. All London?—I was in one that was registered at Glasgow.

2852. None in the Tyne?—No.

2853. Nor in the Cardiff district?—Nor in Cardiff.

2854. So far as your experience goes, the Board of Trade by this 4° have decreased the angle of screening, and not increased it?—In my own experience they have, I do not say collectively, but in several instances. I am not in a position to say what was the mean angle at which vessel's lights were screened, but I know plenty of cases where the screening has been in excess of 4° considerably. I believe that 4°, on the average, would probably be about what they all are now.

*Capt. S. R. Chandler.*

22 May 1895.

2855. But to go back to the 1892 rule, when the 4° instruction to surveyors came in. In steamers you have been in command of previous to that time your lights were screened to more than 4°, according to your own experience?—Yes; not in all of them, most of them.

2856. Then your complaint, if you have one, is that they have not decreased it enough?—Not decreased it enough.

2857. You are quite sure, as far as the navigation in the class of vessels you were concerned in goes, that the angle ought to be less than 4°?—I am.

2858. As small as possible?—As small as possible.

2859. (*Captain Castle.*) But you take your screening from the centre of the wick, I think?—From the centre of the wick.

---

## Thursday, 23rd May 1895.

PRESENT:

THE RIGHT HON. SIR FRANCIS H. JEUNE IN THE CHAIR.

| | |
|---|---|
| Rear-Admiral ANDOE. | Captain HALLETT. |
| Captain WILSON BARKER. | Sir EDWARD HARLAND. |
| Mr. BOLAM. | Mr. SCRUTTON. |
| Captain CASTLE. | Captain THOMSON. |

Mr. C. HIPWOOD, *Secretary.*

Captain DUGALD MCDONALD, called and examined.

*Capt. D. McDonald.*

23 May 1895.

2860. (*Chairman.*) I think you are a Clyde River pilot, are you not, in the compulsory pilotage district under the Clyde Pilot Board?—Yes.

2861. I think you have held that position since January, 1891?—Yes.

2862. You are a member, I think, of the Clyde Pilot Board under an Order in Council of 1890, which provides that the river pilots shall have three representatives on the board?—Yes.

2863. You are one of those representatives?—Yes.

2864. I think you hold an extra master's certificate of competency and are a lieutenant in the Royal Naval Reserve. And before 1891 you were in command of large sailing ships?—Yes.

2865. How long did you hold command of these ships?—About eight years.

2866. Where did they trade?—To the south, round both Capes, the Cape of Good Hope and Cape Horn, India, and California.

2867. And have you served on steamships also?—Yes.

2868. In what capacity?—As chief and junior officer. I was appointed to a command, but did not sail in that capacity.

2869. Before joining the pilot service, how long were you at sea altogether?—23 years.

2870. I think you appear, do you not, to represent the Clyde river pilots?—Yes.

2871. What is their number?—About 40.

2872. Between what points do you pilot ships?—Between Greenock and Glasgow, and on special occasions as far as Cumbrae Head.

2873. Can you give me the numbers of ships that you have piloted, by night and by day, between Greenock and Glasgow?—About 560 ships.

2874. That would include, I presume, both large and small?—Both large and small, and at all periods of the 24 hours, night and day.

2875. I think, upon this subject, your views represent those of your brother pilots, do they not?—Precisely.

2876. With regard to the channel over which your piloting operations take place, what is the width of the channel for deep draught ships in the narrowest part of the river?—The width of the channel available to work deep draught ships would be about 200 feet, and the width of channel available to work light draught vessels would be about 400 feet in the narrowest part of the river.

2877. In regard to the screening of side lights across the bow, what is your opinion as to what the size of the angle should be?—My opinion is that the angle should be as small as it is possible to have it.

2878. Have you had practical experience which has led you to form that opinion?—Yes, I have, in going up the river, meeting small vessels on several occasions; and on one occasion, as lately as the 10th instant, I met a steamer coming the other way with a light showing so much across the bow that had I not seen the hull of the ship I would have kept out of her way so far that I would have put my ship ashore; but, owing to being able to see all the hull of the ship, I could see that she was going on a parallel course to me notwithstanding that her side light appeared to show that she was crossing my track.

2879. The lights of the large steamers belonging to Glasgow are now, are they not, screened to the 4° angle since the Order in Council was issued?—Yes, I believe they are, and although we get the ships up safely, notwithstanding that the lights are screened to this 4° angle it is mainly owing to the fact that we can see the hull of the ship—the outline of the ship—owing to lights distributed along the decks, perhaps from the cabins, showing through the ports; and also I may mention the tug boats; they generally have one astern, which shows us the line upon which they are going independent of the side lights; and independent of that each ship keeps its own side of the channel.

2880. I suppose that is the starboard side?—That is the starboard side.

*Capt. D. McDonald.*

23 May 1895.

2881. Can you give me what your belief is as to the opinion of owners of large liners such as the Allan, the Anchor, or the City. Do they, as far as you know, agree with your view upon this point, or are they opposed to it?—They agree entirely with my view upon this point, the Allan, Anchor, and the City I know, but the others I am not sure about, though I think it is highly probable that they are of the same opinion as those companies I have mentioned just now.

2882. And is it your opinion that the screening to 4° would be a source of danger?—It is.

2883. And, speaking of the Clyde river navigation especially, with which you are connected, your judgment I understand is that the smaller the angle to which the lights show across the bow the greater safety there is?—Surely so.

2884. That is the opinion of those with whom you have been brought into contact on this subject?—Yes, precisely.

2885. (*Rear-Admiral Andoe.*) That refers to navigation in narrow waters particularly, does it not?—Yes.

2886. You have not had actual experience of navigating these vessels in open water, have you, as a pilot?—Well, no, not as a pilot.

2887. Then in piloting these vessels up the Clyde, pilots always keep to the starboard hand, do they not?—Quite so.

2888. And you presume that a pilot coming in the opposite direction is keeping on the starboard hand also?—That is so.

2889. And if you saw two lights nearly ahead of you, would you alter your course, we will say to go across the bows of that vessel to port, or to put your ship into danger in any way, or would you expect the pilot to keep clear of you. Would you keep your side or not?—I would keep my own side.

2890. Lights or no lights; that is to say, whether the lights in the ordinary sense in following out strictly the rule of the road would entail a change of course which would send you ashore or across the bows of the other vessel?—The rule of the road would not apply in the River Clyde. The harbour authorities regulate that. We have to keep to the starboard side of the river, and it is only under exceptional circumstances that we would pass on opposite sides. But although we keep our own side of the river, we feel very uneasy when we see the starboard light when we ought not to see it. All ships coming down the Clyde, or going up the Clyde, do not have pilots on board, because a great many smaller vessels have a license, and though they may know the river quite as well as the permanent pilots do, still we do not depend so much upon their action as we do upon the action of men of our own staff.

2891. Do all the large steamers going up and down the Clyde have local pilots?—They all have local pilots.

2892. Only the smaller class do not?—Only the small class do not—coasters.

2893. You are aware that before the Regulations came out the side lights always did cross the bow at a certain angle?—Well, I have heard that said; I am not quite sure of the fact that they did, but I have heard it; it is just information I have got.

2894. Did you ever observe the dark lane that has been talked about?—I never did.

2895. Is not that a proof that the rays of the light must cross?—Yes, I suppose it would prove that; but I would fancy the rays might cross and meet, although the lights were screened parallel to the keel.

2896. Have you got reason to suppose the angle of screening has been increased in consequence of the 4° order in most ships?—In some cases, I believe, there has been an increase, but I cannot say positively; I have been making some inquiries upon the point.

2897. Of your own observation, have you noticed any great difference?—No, I have not noticed any difference, and I think it would hardly be easy to notice that just with the eye.

2898. (*Captain Thomson.*) I wish to ask you a practical question, and I should like you to consider yourself in the position, as far as possible, that I am going to put you in. Supposing you are in a short handy steamer not renowned for speed, and your true course is N. with a strong head wind—will you kindly take the compass card before you—and steering N. you suddenly see the two side lights, either of a sailing vessel or a steamer, bright and wide apart as if that ship was pretty close to you, and the red light, which looks the brighter of the two, bears N. 5° E., what would you do then?—I am steering N. and the red light bears N. 5° E.?

2899. (*Mr. Bolam.*) Can he see the green?

(*Captain Thomson.*) Both lights are seen?—Is there a mast-head light?

2900. I said a steamer or a sailing ship?—And I am on a steamer, and I see his green and also I see his red light?

2901. Yes, you see the red, rather the larger and brighter of the two. If it is a steamer you see his mast-head light bisecting those two lights?—Yes, then he is half a point on my starboard bow?

2902. Yes, 5°?—I see his three lights, and I should port.

2903. Amongst the steamers that you have piloted I take it that for every one which is a twin screw you might pilot 100 single screws, roughly speaking?—The twin screws are not so numerous as the single screws.

2904. The majority of the steamers that you pilot which are single screws have a right-handed propeller, have they not?—The majority have, but a great many come into the Clyde which are left-handed.

2905. You would expect the captain, when you go on board, to inform you if it is a left-handed one, would you not?—Well, I should suppose he would; but I have learnt that lesson, and that is the first question I ask when I step on board a vessel.

2906. With most steamers which have right-handed propellers, when you turn astern, the action of the propeller is to assist your port helm?—Certainly.

2907. And the action of the propeller would oppose the action of the starboard helm?—No, on the contrary; in going astern, if I wanted her head to turn to starboard, I would put the helm to starboard at once, although the ship had headway on her.

2908. You do not quite understand my point. I am not speaking of a ship going astern, but going ahead; her engines are suddenly reversed?—Yes.

2909. If you had starboarded your helm before you reversed your engines, am I not right in supposing that reversing your engines with a right-hand propeller would oppose the action of the starboard helm?—Undoubtedly it would.

2910. In the case I mentioned, if that ship had been very close to you, when you said you would port, is there anything else you might have done?—Yes, if she was very close, so that I could not clear her with porting; but I am not speaking of such a case as that. When I can see her three lights clear, unless there is fog, or something of that sort, I have very little to port; only 5° before I am clear. But if she is so close that I could not clear her without going astern, I would certainly go astern without any hesitation.

2911. And in reversing your engines, you would know that would assist you in turning to starboard?—Yes.

2912. In a case of that kind, do you not think it would give you confidence if you were quite certain that the vessel you are trying to clear—that you reasonably hope you will clear by acting promptly in this way—was not going to starboard? Would that not give you great confidence?—Undoubtedly.

2913. We have considered that question in the case put to you without reference to screening. Now let us consider the question, bringing in screening. The same conditions hold exactly. But now you are in a steamer whose lights cannot be seen at a greater crossing angle than 2°. That vessel you have ported to will only see your green light. That is so, is it not?—Yes.

2914. But if your lights were screened so as to be visible across 5°, she would see both your lights, would she not?—She would, I suppose; yes.

2915. Would she not?—Yes, I suppose she would.

2915*a*. And in that case what would she be bound to do, if she saw both lights?—She would be bound to take the same action as I should; namely, port.

2916. Therefore, in one case, you would be quite certain she would port, and help you to clear, and in

the other case there might be a doubt in your mind whether she would port, starboard, or stand on. Is not that so?—I do not think there would be much doubt in my mind, speaking from the practical point of view, because we do not try to pass each other within 2° or 3° at sea.

2917. But I have given you purposely a case of emergency where you would not have time to consider the case of screening, but you would simply act as a practical seaman would act?—Yes.

2918. (*Captain Wilson Barker.*) You have had experience, of course, of working a ship at sea, and also in narrow waters?—Yes.

2919. Do you find that you see much more of the light in narrow waters than at sea?—Do you mean being screened across the bow?

2920. Do you see them much more spread out in narrow waters than at sea?—Yes, you do. But I think that is merely passing them so much closer than at sea, as a rule.

2921. Therefore you think fine screening might be very good in narrow waters; but do you think it would be as good out at sea?—Well, I have given that the best consideration that I can, and I do not at all see so much objection to screening a little across the bow at sea where there is plenty of room, as I do in narrow waters, because, of course, from the fact that they are screened to any extent across the bows—I do not care whether it is much or little—ships will pass a larger berth clear of one another than if they are finer screened.

2922. Then, I suppose, you think it is very advisable that, at sea, they should give one another a much wider berth than in narrow waters where the water is smooth?—Yes, but I do not see any occasion for vessels to come very close to each other at sea, where there is plenty of room, and, as a matter of practice, that is not done.

2923. But do you not think if they had a fine angle of screening at sea there might be a tendency to cut one another rather fine in passing?—I do not think so. I think the feeling is with all men I have come in contact with that they always wanted to give a good wide berth—they did not want to go shaving as close as they could, and it was only when compelled to that they would pass close to each other. Therefore I think there would be no occasion for wide screening at sea, and I suppose there would be an insuperable difficulty in having two kinds of screening, one wide at sea, and the other narrow in narrow channels.

2924. Of course, you do see objections to wide screening in narrow channels?—Well, I do not see so much objection at sea as in narrow channels.

2925. (*Captain Castle.*) Referring to the helm, do you not think a ship answers her port helm more readily going ahead with a right-handed screw?—No.

2926. I think it has been proved by experiment that it is so—that the case of the propeller acts upon the rudder?—No. I speak from my experience; I have gone into the matter very carefully, and I have had clear object lessons on the matter. I have had it clearly demonstrated that a ship will answer the starboard helm much quicker than the port.

2927. With a right-handed screw?—Yes, going ahead, in fact, with all the large steamers; I may say that the great majority of large steamers going up the Clyde with a right-handed propeller are very lazy on the port helm, and we have tug boats to assist them almost always on the port quarter going round the bends. There is no doubt about that.

2928. Speaking about the tugs, you say you are generally guided by the tug astern of the ship, seeing the direction in which the ship is coming?—Yes.

2929. How are you guided?—You can see the lights of the tug a long way off.

2930. Astern of a big ship?—Yes.

2931. These licensed pilots pass examinations, do they not, for exempt ships?—Yes.

2932. The same as yourselves almost?—Pretty nearly.

2933. (*Mr. Bolam.*) What is the greatest draught of water drawn by vessels coming up to Glasgow?—A little over 26 feet—just a few inches over.

2934. And the depth of water has been practically got by dredging?—Yes.

2935. The Clyde was not so many years ago little better than a muddy ditch?—That is so.

2936. The consequence is, that the navigable channel is extremely narrow, narrower than the stream itself?—Yes.

2937. You said the breadth of channel is 200 feet for large draught ships?—Yes, for working on.

2938. If two ships pass in that way each with a beam of 60 feet, and they go to the extreme verge of the navigable channel, how much does that give you? If you subtract 120 from 200 that leaves 80, or nearly 80 feet clear space?—Yes.

2939. The navigation is an extremely delicate matter?—It is very delicate indeed.

2940. The matter of a little more helm or a little less helm is of great importance?—Great importance.

2941. Supposing you had one of these vessels allowing a little margin through the amount of helm, what would probably happen?—It would probably happen that if she was well over the limit of 200 feet she would smell the ground and the result would be that she would fly off to mid channel from the banks, and the helm would have no effect upon her; and supposing there was anything passing then, even though you immediately reversed your engines, you would probably run into the other vessel, and strike her. So that you would have to meet each other practically end on—practically two large ships drawing all the water there is must meet as dead end on as possible, and not give way to each other till, say, they are within 200 yards or thereabouts.

2942. Then a ship that is smelling the ground in that way, and then flying round with her stem, it is quite possible she might hit any ship in passing?—Yes, it is very likely.

2943. Small helm in the Clyde is of great importance?—Yes.

2944. And do you consider small helm in narrow waters is best got at by small screening in side lights or large screening?—I do not quite follow you.

2945. The question of helm is a vital one according to you, you must give a ship as little helm as possible—that is essential?—Well, I do not know whether that is essential. If you give a ship helm, and she answers it, it does not matter whether one requires more than the other; providing she answers and steers straight, the amount of helm is not of such great importance.

2946. At all events, you must not alter the ship's course much in the narrow parts of the Clyde?—No, whatever helm you give she must answer readily.

2947. By giving a small amount of helm, of course, I mean turning the ship's head round through a very small angle, that is absolutely necessary?—That is quite true.

2948. Are your duties as a pilot, from that point of view, assisted by having a large angle of screening or a small one?—They are assisted by having a small angle of screening.

2949. You have no doubt about that?—I have no doubt whatever.

2950. You have had a large experience in sailing ships?—Yes.

2951. If you were going to sea in a sailing ship again, would you prefer a large or small angle?—I would have a small angle.

2952. You think, even at sea, you would prefer a smaller angle?—Yes, I consider the disadvantage attending a large screening is greater than its advantage.

2953. When you said that you were not sure whether the lights crossed the bows before, did you mean the whole beam of the light or only the reduced beam from a part of the wick. Did you know, before the change of rule of 1892, that the reduced beams always crossed the fore and aft line of the ship, or did you think that the light was screened so that the screens came and actually obscured the light right ahead?—I thought that the screen was in a line with the inside of the wick.

2954. So that you knew that the reduced beams from the reduced part of the wick always crossed?—Quite so; yes, I was aware of that.

2955. You mentioned the case of a steamer as giving you some trouble in the Clyde, and you were only able to keep out of her way by seeing her hull?—Yes.

*Capt. D. McDonald.*

23 May 1895.

2956. Is that a solitary case or a common case?—No, it has happened in my own case, perhaps half-a-dozen or seven or eight times.

2957. Do you think it is rather a common experience in the Clyde?—Yes, rather too common.

2958. And that experience is since the lights of these small steamers were screened to four degrees?—That I cannot say.

2959. It is since 1892. And the supposition is that since 1892 the Board of Trade have screened all ships to 4°, therefore we are justified, I think, in assuming that anything which has happened since 1892 is owing to the new screening?—Yes. Well, I do not know that it might not have happened before that; they might have been badly screened. I do not know.

2960. (*Mr. Scrutton.*) You have stated that only under exceptional circumstances did you break the law of the Clyde Navigation Board with regard to the side of the river upon which your vessel was placed?—Yes.

2961. What exceptional circumstances would that be?—Well, providing a steamer is coming down as I mentioned a moment ago, perhaps she would be too far over to the side, and she would smell the ground, and be sheered across and take the bank on my side of the river; that would be on his port side.

2962. Would going on the wrong side be a matter of accident, or a matter of design?—On my part it would be a matter of design, and on her part it would be a matter of accident.

2963. That would be to avoid her?—Yes, to get a passage out.

2964. These vessels of 26 feet draught, do they go up and down the Clyde at night?—Yes.

2965. How are you working the engines, at half speed, or what?—Full speed in the straight reaches; the average passage is about two hours, unless we have to go in one of the docks; there are no gates to them, just a bridge, and the distance is somewhere about 22 miles.

2966. You would not take the vessel up unless it was a clear night, I suppose?—I would not take her through a dense fog, but it is surprising the weather we go through. I have never known a ship detained from more darkness, no matter how dark the night was.

2967. You have referred to the advantages of large screening as against the disadvantage; that is, 4° as against 2° or against 1°. Would you just be good enough to tell me in a few words what would be the advantages of large screening, and the disadvantages. Take the advantages first, of the large screening—by large screening I mean 4°?—Well, the advantage that I can see is in wide waters; that in trying to shut out the other vessel's light you would pass at a greater distance from her.

2968. Now the disadvantages of large screening?—I must say that I have not just given that the consideration that would enable me to answer the question properly outside. I have thought it out as far as regards my own narrow waters, and I have given a reply to that; but I cannot say altogether all the disadvantages there might be against it in open water.

2969. Still, what you have said as far as I understand it is that in regard to the lights of a large steamer belonging to Glasgow, "I believe they are "screened to the 4° angle, and although we have no "difficulty in passing the other in safety, so far as the "side lights are concerned, that safe position is mainly "due to the fact that owing to the numerous lights "on the side of the ships their outlines can be "distinguished." Do you wish to add anything to that in answer to my question?—No, but I think the inference can be drawn from that, that notwithstanding they are screened across the bow there are other helps which we have through seeing the outline of the hull of a vessel.

2970. With regard to the fine screening, what are the advantages of that?—In fine screening in the river we can keep our position and we lose sight of the other vessel's green light coming down near; if she was screened widely we should be keeping away, and keeping away until we got to the shore.

2971. About the disadvantages of fine screening, you are clear about them?—There are no disadvantages that I know of.

2972. (*Sir E. Harland.*) You were describing the difficulty you have in piloting big ships up and down the Clyde now. I presume that where the two ships are meeting each other, one being a big vessel and the other a good deal smaller, the smaller ship would be disposed to give way a little to the big ship, so as to prevent a block on the river, and a stoppage of traffic; because if the smaller vessel had insisted upon keeping a full half of the river, she might have driven the larger ship too close to the bank and stuck her there and jambed the traffic?—Yes.

2973. Is it customary for smaller ships to do that when they recognise by the number of cabin lights from a ship, that she is a very big ship?—Oh, yes, they can see that.

2974. They are inclined to give way rather to this very big ship?—Yes, generally; but the exceptions are rather numerous where they do not give way as much as they should.

2975. If you are piloting a big ship down should you expect that they would give way?—I should expect they would, and if I were on a smaller vessel I should give way.

2976. You were referring to right-hand screw affecting the steering whether with a port or starboard helm. Did you ever try letting the helm go in clear open water to see which way she would turn without any helm at all?—I have not exactly done that, but I have done what amounted to the same thing—by looking at the amount of helm she carried to keep her steering steady for a certain point.

2977. Supposing you are steering with a common tiller, and you have a right-handed propeller, and you let the tiller go, what would the effect of that be?—The effect would be that you would continually turn the head to port. The amount of helm you require to counteract that is shown at once by the number of degrees you have to turn to keep a ship steady for a given period; it would generally be 8°.

2978. So that with starboard helm she generally keeps going to port?—Certainly.

2979. (*Captain Thomson.*) In the reply you have given to the last question, would you account for the ship answering her starboard helm quicker than the port helm, going ahead, by the direction of the action of her propeller?—Undoubtedly.

2980. Would you think it due to the action of the lower half of the propeller?—I could not divide the propeller in that way, I take the propeller as a whole.

2981. Have you had any experience of hand steering gear in large steamers?—Yes.

2982. As an officer of the watch?—No, as a pilot. We have any amount of quite large steamers coming up with hand steering gear.

2983. But have you any experience of hand steering gear as an officer of the watch at sea?—No, only steam.

2984. Would you tell me what sized steamer you have piloted with hand steering gear, or what length?—Quite considerable sized ships—perhaps 1,300 to 1,400 tons register—quite large ships.

2985. Have you found it more difficult to give port helm or starboard helm?—Well, my experience in that respect has been that it has been very difficult to give them either helm, and if I require to get the helm over I have to slow the engines; I could not get it over while the ship was going full speed; but whether there was any difference between port and starboard, I could not say that I have paid particular attention to that. The result with hand steering gear and steam steering gear has been that ships, when going apparently steady, carried about the same amount of port helm—that is, from 8° to 10°.

2986. Do you think it possible that the officer of a large mail steamer steaming 12 knots may have to call up several men of the watch on to the bridge in order to give hard-a-starboard helm with hand steering gear?—Yes, I think it quite likely.

2987. Do you think it also likely, under the same conditions, that hard-a-port helm might be given by the man at the wheel with the assistance only of the officer of the watch?—With hand gear?

2988. Yes?—And a ship going full speed at the rate of about 12 knots?

2989. Yes?—I do not think so.

2990. But you have had no practical experience of it?—No, but I have had practical experience of ships with hand steering gear going up the Clyde shifting the helm backwards and forwards. I think you might have more experience going up once in that way than going two or three voyages.

2991. You would not think it a discrepancy at all that a ship should answer starboard helm going ahead better than she should answer port helm, but yet that it should require much more force to put the helm a-starboard than to put the helm a-port?—I should not think that it was what I would be likely to expect. I would think the starboard helm would be easy given to her.

2992. You understand it? If a ship obeys her starboard helm better than the port, going ahead, it shows practically that there has been more work done—there has been more effect put upon that ship's stern to turn her?—Yes, but the work that has been done has been done irrespective of the rudder—it has been done by the propeller.

2993. But work must be done in order to turn her; you see there is some resistance to turning the rudder, is there not?—Yes.

2994. The more resistance to turning the rudder the greater might be the effect in turning the ship with the same angle of helm; do you see that clearly?—No, I cannot see through that.

2995. I think you can take it from me that you are quite right in saying that a ship going ahead with a right-handed propeller obeys her starboard helm quicker than the port helm, but at the same time it is very much more difficult to give that ship the same amount of starboard helm than to give her the port helm?—I daresay that may be, but that amount of starboard helm will do twice the amount of work that the same amount of port helm will do. Supposing she had 10° or 15° of starboard helm, that will turn a ship as quickly as if she had 20° or 25° of port helm.

2996. But you will not dispute that it will take twice the number of men to work the starboard helm that it will to work the port helm?—Yes, perhaps it would.

2997. (*Sir E. Harland.*) I think you said a few moments ago, that if it took so many men to give the vessel starboard helm hard over, it would take more men to give her port helm hard over?—Well, I did not exactly say that, but I said I would not be surprised if the officer had to call up two or three men to put the helm hard-a-port. I think that is what I said.

2998. Two or three more men than to starboard?—No, I did not distinguish between port and starboard at all.

2999. Just to clear that point up, take, for instance, a vessel without any helm at all, and the rudder perfectly free; if she had a right-handed propeller and went ahead, she would go to port?—Yes.

3000. Then does that indicate that it would be easier to give starboard helm?—Well, I would have thought so; only that this gentleman here has been questioning me, I am not so sure about it; I did not give the matter attention before, but I just think that if the vessel was inclined to go to port perhaps it would be easier to give starboard helm than to give port helm.

3001. I gathered from your evidence that less power would be necessary to put the helm so many degrees to starboard than to put it so many degrees to port?—That is not exactly what I meant. I meant that, with a given amount of starboard helm on board a ship, the ship would turn quicker.

3002. Then does that not mean that she is more disposed to go to port?—Exactly.

3003. Does it not necessarily follow, that it will require less power to give starboard helm?—Yes, but I understood the question that was put to me was, would it require more power to put that helm hard-a-starboard than to put it hard-a-port. Well, I would have thought at the first blush that it would be easier to put the helm hard-a-starboard than to put it a-port.

3004. On second thoughts is it your opinion that that would be the case?—No, I could not give any opinion upon that matter, only when the helm has been given to her I know precisely how the helm acts, that is, that she will act much quicker with a starboard helm than she will with a port.

3005. (*Captain Hallett.*) Do you think in practice, if you wanted to get your ship's head four points to starboard or to port, it would make any difference which way you would put the helm over?—I think, very little.

3006. I mean, would it require more work?—No, but at the same time, if I had to go four points, and I could go either way, and if there was any danger ahead, and I wanted to turn the ship in a limited area, I would certainly do it on the starboard helm rather than the port helm.

3007. But in actual practice, with a big ship in hand, do you think it does not take a greater amount to port four points than it does to starboard—or perhaps the difference is not appreciable?—No.

3008. (*Sir E. Harland.*) In answering that question, I suppose you are still contemplating hand gear and not steam gear?—It does not make any difference whether it is steam gear or hand gear.

3009. But did you not tell us a little while ago that one of these big ships with hand gear took a number of men to work it, that it was not so easy to get the helm over?—Undoubtedly, that is perfectly clear; but steam steering gear represents a great number of men.

3010. I want you to bear in mind that the answer I presume you have been giving dealt with hand gear, and not with steam steering gear?—The answer I have given just now?

3011. Yes?—The gentleman put the question to me as a practical question; I told you that such a thing would never be taken into consideration—that the difference in the labour would be inappreciable; it would not be taken into consideration.

3012. That is, with steam steering gear?—Or with hand gear. Supposing you required another turn of the wheel, it would be nothing at all. But if you wanted to turn her quickly, you would turn with the starboard helm instead of the port, because she has a natural tendency to turn that way.

3013. (*Captain Castle.*) Is it not a common practice when you have to navigate in narrow channels to stop the engines, put the helm hard-a-port, and then go full speed ahead?—In coming round the turns in the Clyde, where you require every inch of water you can get, the practice is to slow the engines before she comes up to the turn.

3014. To slow and stop?—No, I have never found it necessary to do that.

3015. You have to do it in the Hooghly, and in the Thames, coming round Blackwall point with a flood tide?—We put the helm hard over and let her lift, and when she lifts slowly, give her full speed.

Captain Luke Blumer Hubbäck called and examined.

3016. (*Chairman.*) You are, I think, in the service of Messrs. Alfred Suart & Co. Would you tell me what position you hold?—Master in the merchant service.

3017. How long have you been in the merchant service?—Over 30 years.

3018. And how long have you been a master?—Twenty-six.

3019. And what sized vessels have you commanded?—From 500 tons to 2,050.

3020. Have you commanded both sailing and steam ships?—No, only steam.

3021. Are you at present master of a vessel?—No; at the moment I am on a holiday.

3022. You have, I think, been master, or held some office on the steamship "Prudentia"?—I have been in command of her last.

3023. During your experience on that vessel has her trade been all over the world, or has it been confined to a particular locality?—Well, I have been mostly all over the world, in all waters.

3024. I should like to have your opinion with regard to this rule of the Board of Trade ordering lights to be

*Capt. L. B. Hubback.*

23 May 1895.

screened to 4°. What is your opinion as to what the screening of side-lights should be?—I should have them the smallest possible angle that could be found.

3025. I do not know whether you have gone into the question exactly of what that angle should be, or whether you desire to put it in the general way you have, namely, that it should be the smallest possible angle?—I have not gone into what the angle should be. There are so many conflicting positions of the lights and screens; but I should say reduce it to the very smallest angle.

3026. Would you reduce it to a smaller angle than is now in force under the regulations of the Board of Trade, namely 4°?—Much smaller.

3027. Before the Board of Trade regulations came into effect what was your experience as to the screening of lights? Do you think they were screened to more than 4° as a rule, or less than 4°?—Well, I have had them screened much less, and I have had them screened a very great deal more.

3028. The vessels you have sailed yourself, for example, during the years you have been master; what would you say as to their screening? Have you had to alter the chocks by reason of this new order of the Board of Trade, and, if so, how?—I have found, under the old rules, before 1892, that the lights were showing across the bow in some instances I should think 6° or 7°, after being screened by the officials.

3029. Then was there, in your judgment, considerable want of uniformity before the 1892 rule, in the way of screening?—I think so.

3030. Some being screened fine and some broadly?—I think so. I have taken ships from various parts of the country, both north and south, and I have found great diversity in the screening of the lights.

3031. In your practical experience have you ever found it necessary, or, in your judgment, desirable, to reduce the angle of the lights after the chocks had been placed by the Board of Trade officials?—I have done it three or four times. I have found it absolutely necessary. As an illustration; in 1892 I took command of a steamer in the Thames (the name is not necessary; you shall have it if you wish it), and the first night in the channel I was going round to see how things were going generally in my new command, and I found I could see the side lights with my own eyes, only 10 feet from the centre line of the ship, although the side lights were placed about 24 feet from the stem on the after end of the forecastle. I took the trouble to take measurements, and from the centre of the wicks there was 29 feet, that is, from centre to centre across the ship, 18 feet forward of the light and 10 feet only from the centre line I could see the side lights distinctly.

3032. And those were lights which were screened, were they?—Yes, screened with metal screens.

3033. Would you regard that particular state of things as a state of things which was desirable? I suppose not; you altered it?—Certainly not. I had it altered in an hour. I turned the carpenter out and had the screens altered at once, and I concluded that those lights would be seen across the bows, perhaps 8° or 10°, and I considered that was not a safe way to go navigating among a lot of ships.

3034. Did you consider that unsafe?—Certainly.

3035. Do you lay stress upon the importance of this fine screening, especially in crowded and narrow waters?—Yes. I think it is of more importance in the narrow waters than anywhere else. Take the very crowded waters on our own coasts, or some of the narrow waters of the Mediterranean, where we might have a vessel on each bow showing her three lights, there are other lights again to the right and left of those, and sometimes if the lights are showing across the bows it is almost an impossibility to tell at what angle those ships are approaching you.

3036. You refer not only to narrow waters such as the Thames and the Clyde, but to such waters as the Dardanelles?—The Dardanelles and the Sea of Marmora.

3037. And the Grecian Archipelago?—Yes, all those places where there is not much room to deviate from the course.

3038. I see that you have instanced the Inland Sea of Japan?—Yes, there also we have to take some very narrow channels sometimes amongst the islands; if the lights are seen across the bow there is no more room to port, and there is something close to you on your starboard side, and *vice versâ*.

3039. Do you have pilots for the Inland Sea of Japan?—No, I have not had them, because in 1874 I first began in Japan waters, and I used to navigate the seas myself afterwards.

3040. But you have local pilots for the Sea of Marmora and the Dardanelles?—No. In Constantinople there are a few local men for the Bosphorus who have left the sea and settled on shore and call themselves pilots.

3041. There is not compulsory pilotage?—No, not compulsory pilotage.

3042. In your judgment, is the relative position of the masthead and side lights an important matter?—Yes, I would not have them before the masthead light. I mean if the side lights were placed in the plane of the masthead light or, as they used to be placed in the early days, abaft the masthead light, immediately a vessel altered her helm, supposing she was approaching on the starboard bow and altered on the starboard helm, the nearest angle to you would increase, the angle from you of the other light would decrease. You know if the angle nearest to you is larger it is impossible to strike you, she is evidently on a course that would clear you, but with the side lights before the masthead light you have altered the thing entirely, because on the same manœuvre the green angle would increase and the port angle decrease, and this would confuse you as to what the vessels were doing if there were several meeting you.

3043. There is another matter upon which I see you desire to express an opinion, that is the practice in some vessels to place the side lights' screens on small swinging davits, which can be swung inboard in stormy weather. I think you have formed an opinion as to that practice?—I think it is a very bad practice indeed, and ought to be put a stop to. There are so many means of altering the angle of the light unknowingly, and screens hung on davits which have come under my own observation are secured by a fore-and-aft stay from the bridge rail. If that stay gets bent and hooks on to the after part of the screen, it reduces the angle, and on the other end it increases it very much. In one case I saw them swung inboard; a sea had struck the light and put the light out, and the officer on the bridge—it was a ship under my own command—thought it would be better to swing it right inboard, and I went on the forecastle to demonstrate to him what he had done, and from the stem head I could see the light.

3044. But the screen was gone?—No; the screen was there, but by being swung inboard the light was showing right on to the stem head.

3045. You have expressed your own opinion as to the side lights being screened to the smallest possible angle. What do you think is the opinion of captains in the same position as yourself; do you think they agree with you mostly?—Well, it is a matter which has been discussed amongst us a very great deal, and I have not heard one dissenting voice to the small angle amongst my own profession. They are all of the same opinion, that it should be screened to the smallest angle.

3046. (*Rear-Admiral Andoe.*) Are you aware that if the lights are screened to a line drawn from the inner edge of the wick to the outer edge of the chock parallel to the keel, so that the full flame of the light would show right ahead clear of the chock and the screen, that a considerable amount of light would always cross the bow at a certain distance from the stem of the ship?—Yes, reflection.

3047. May I presume that you would like to have your bow light showing ahead of the ship, or ahead of the light, with the full power, not with the reduced power?—I do not think it is essential that the full power of the light should show right direct ahead.

3048. Do you think that it is not so necessary as anywhere on the bow?—No; two to three points on the bow, I think, is the most effective focus for the light.

3049. Many of the ocean tramps, as they are called, yaw a good deal, do they not, in steering?—Yes, some of them very much.

3050. How much do you think, in moderate weather, not a gale of wind and not dead smooth water, but moderate weather, say, coming up channel?—It is quite usual to meet them varying two to three points, a point to a point and a half each way.

3051. Considering they steer so wildly, how does very fine screening affect them?—I was not speaking of the ocean part, only for the narrow channels; certainly I would be very loth to navigate a narrow channel where one of these vessels was yawing two points.

3052. I am not speaking of narrow waters, but of the English Channel, before an ordinary westerly half a gale, with a considerable sea following; if the tramp steered within a point either side of her course, that would be very good, I suppose?—A point on either side would be very good steering.

3053. Therefore, if she were approaching another vessel a little on the starboard bow, she would show both her lights, first one and then the other; to the vessel approaching her she would be showing, as it were, both lights?—Yes, both lights, red and green.

3054. Supposing that one vessel A were very finely screened with an electric light, so as to send her lights straight ahead, scarcely at all across the bow, and that another vessel B were coming down half a point or a point on A's starboard bow. [*Describing with the models.*]—Yes.

3055. We might presume that, at half a mile, in a a couple of minutes, both steaming in opposite directions, you would pass one another. A sees two lights, and B sees the green light only; seeing that it is on her starboard bow, she starboards a little to give her a wide berth, but A, in consequence of the yawing of the approaching vessel, has seen both of B's lights, and has determined to port?—That is not seamanship. I cannot agree to that; the man has no business to make up his mind in such a hurry.

3056. It is half a mile. It would only take two minutes supposing they were each going 12 knots?—But they must have been seen before half a mile.

3057. But we will take it as moderately thick weather; *this* ship is yawing and coming along like that, and shows both her lights, what would you do?—If I saw both lights, and I was giving her the starboard helm, I would give him a broader light.

3058. You would give starboard helm?—Yes, give him a broader light.

3059. But then you would be going against the rule of the road, would you not?—No.

3060. If she is nearly ahead, showing both her lights?—No, she is shutting in first one, and then the other—she is keeping quite straight.

3061. Would they shut in actually like that?—Certainly, yawing a point each way.

3062. How do you know how she is steering exactly?—I should say that she was coming parallel to me if she was showing me first the red and then the green light.

3063. Then you would go off on your starboard helm?—Yes.

3064. I should have thought you were going against the rule of the road, because she is ahead, or nearly ahead?—If she gave me a steady light, I should act on the port helm.

3065. But if she was yawing you could not tell how she was steering?—Then I am giving her more room.

3066. There is another question. Supposing both are finely screened, and are both steering steady courses—two mail steamers—and showing green to green, if they continue their courses according to the rhyme which says "Green to green, red to red, perfect "safety go ahead," as the officers of the watch might do, thinking they were following that rule, would they not pass very close—too close for safety?—Well, I should think no officer on the bridge would be so ignorant but what he would know whether he was going to pass that ship so close. It is an undefined and inexplicable thing, but an officer on the bridge, if he looks at a light, can tell if he is going so close; if they were approaching close they would starboard their helm, but if there was a fair green light to be seen, there would be no occasion to do that at all.

3067. Then they might go very close indeed. Do you think it is desirable to place more discretion in the hands of the officer of the watch than is the case with the present law?—No, I think the law as it stands is very well. Most of the young officers that have been with me seem to grasp it pretty well.

3068. But then, if you go by that law, "Green to green, red to red, perfect safety, go ahead," you go straight on your course instead of giving the starboard helm and keeping away; would it be necessary to alter that law, or alter the wording of it, rather?—I think there is another part of that, that the officer of the watch has to do everything to avoid a collision. If he sees the green light so far ahead that it is likely to pass close, naturally he would starboard his helm to give a little more room.

3069. Then you think upon the whole it would be better to leave a little more discretion in the hands of the officer of the watch than to make such a hard and fast rule as at present, with the broader degree of screening? Because the object of the broad screening, the Board of Trade contend, is this, that the light being thrown across the bows to a certain extent, directly both vessels see the lights, they immediately port their helm, and go clear of one another in that way?—I have never seen it interpreted in that way. That may be the idea of the Board of Trade, but I have never seen it interpreted so. I think it is a generally understood thing amongst nautical men that if a vessel is approaching and yawing, showing first one light and then the other, whichever light you are getting broad, they keep to that; and I think, as a practical man, that it is a point of safety to do so.

3070. It depends upon the side on which you find yourself?—On which you get the broad light. Of course, if both are showing three lights all at once, then act upon the Board of Trade rule, "If you see three lights ahead, port your helm, show your red"—Mr. Gray's rhyme.

3071. Have you frequently observed in steaming in the channel in rather narrow waters that vessels very suddenly cross your bow; after nearly crossing it one way, they hard-a-port and come the other way?—Oh, yes.

3072. It is a common occurrence, is it not?—Yes.

3073. What is that due to?—Different things. The man at the helm may misunderstand the order. There are such things as currents and tides.

3074. I am putting aside the currents altogether?—I have not seen that, only in one instance—a Liverpool steamer—we got close together.

3075. But on the whole you think that if the side-lights were screened to as small an angle as possible, it would tend to safety. When I speak of the channel I mean the English Channel?—Yes.

3076. Where you meet a large number of ships?—Yes, I am decidedly of that opinion.

3077. (*Captain Thomson.*) Have you any experience of hand steering-gear in steam vessels?—Not of late times, in early days I had.

3078. As an officer of the watch?—Yes.

3079. Have you found it more difficult to put the helm over one way than the other?—Are you speaking of working with the screw, or with side wheels?

3080. I am speaking of screw steamers—speaking of handgear?—In hand gear I have found a difficulty in getting the helm a-starboard.

3081. Do you find it more difficult?—Well, more difficult; you can get the port helm at a larger angle and quicker than the starboard helm.

(*Mr. Bolam.*) With a right or a left handed propeller.

3082. (*Captain Thomson.*) I am speaking of a right-handed propeller?—I have never been with a left-handed propeller, always with a right-handed propeller.

3083. I want you, just for the sake of accuracy, to take the compass card when I ask this question: Supposing you have a steamer steering due north in moderately thick weather—say you had run out of a hail squall or a small fog bank, and you suddenly see both the side lights of another steamer, the red light may appear a little the brighter of the two, and that red light bears N. 5° east, what would you do?—Seeing both lights?

3084. Yes?—Well, am I to understand that she is so close that the green light would bear less than 5° easterly.

3085. Never mind. You need not suppose they are too close. Suppose you run out of a small fog bank.

(*Chairman.*) What distance will you put?

(*Captain Thomson.*) Well, shall I say half a mile?

*Capt. L. B. Hubback.*

23 May 1895.

(*Mr. Bolam.*) The green would, as a matter of fact, bear a little less than the red. Captain Thomson is giving you 5° easterly, therefore the green would bear a little less than that east?—Well, I think the proper course would be to port the helm.

3086. (*Captain Thomson.*) When I asked that question I did not call your attention to the screening?—No, I am speaking with the ordinary screening.

3087. Now, I want to ask you the same question, and I must ask you to consider the question of screening also. In porting as you said you would, would it not give you great confidence, if you were certain in your own mind that when you ported the vessel to which you ported would not starboard?—Well, that is so. At all times it gives me very great confidence to know that that vessel is not going to starboard.

3088. Now the question of screening comes in. You understand that if your lights were so screened as to be visible over a crossing angle of 5°, or more, the vessel to which you have just ported, would see both your lights?—Well, allowing mine to be screened in the same way as hers.

3089. Yes; that is so, is it not?—Yes.

3090. Therefore you seeing both her lights, and she seeing both yours, what would take place?—Both would port their helms.

3091. I am asking you now what that ship would do if she saw both your side lights? You told us what you would do; what would the other ship do?—I should think the other ship would port also, seeing both lights.

3092. Why do you think so?—Because she can see both lights; knowing that I can see both of hers in the dark, she would then act upon the rule of the road, both ships porting their helms; I should expect her to port according to the rule of the road.

3093. Now, take the case, if you please, where your lights do not show across the bow 5°, but only 2°. What light will that vessel see to which you have just ported?—My green.

3094. The green and the masthead?—The green and the masthead.

3095. Nothing else?—No, she will not see the red light.

3096. In that case, would you have the same certainty that that ship would port as in the first case?—No, I would not have the same confidence.

3097. (*Mr. Scrutton.*) Is the other vessel to be screened 2° as well?—I understood that the other vessel was screened 5°, not 2°.

3098. (*Captain Thomson.*) I am sorry I did not make myself clear. I am assuming that both ships are screened alike?—Then I should not see his red light at all.

3099. The *data* I gave you was that you saw both side lights of the steamer?—Yes, but you told me she was screened 5°.

3100. No. At first I did not say anything about being screened to 5°. I did not give you any screening at all. I did not state any number of degrees?—Then I misunderstood you.

3101. Would you like to amend your answers?—If there is anything you think necessary, I will.

3102. I will ask you the same question again. In the same conditions, if you see both side lights of a steamer?—But will you not give me the screening?

3103. Why should I give you the screening?—I say if she is screened to the smallest possible angle, I know now what she is seeing; how her lights bear. But if the screening is erratic, I do not know.

3104. Which screening do you prefer?—Small screening.

3105. I am now giving you the screening to 2°. You see the two lights of that steamer at a moderate distance; your ship heading north. You see the sidelights of that steamer bearing 5°; what do you do?—Port.

3106. Now, you know at that time the ship to which you are porting can only see your masthead and green lights?—Yes.

3107. Therefore, you are not bound to assume that that vessel will port, are you?—Yes, that man ought to know by the angle he has got me upon that he is showing me both his lights, and he knows it is my duty by the rule of road to port my helm to his two lights. That is as near ahead as you can possibly be.

3108. But does not the rule distinctly say that the port helm rule does not apply at night time, when only one coloured light is seen?—Yes, but I see two. I have ported.

3109. But that vessel, you told me, would only see one?—But I do not see that he need port at all. I will go clear of him. I will show my port light, and go clear.

3110. I think if you will just answer the question it will be better. Would you like to use the models?—No. I perfectly understand your question.

3111. Of course models are not quite the same thing; but there you are, we must exaggerate a little. Assume the angle, that is the position; that steamer's two lights are bearing, say, 5° on your bow, you heading north; you told me you would port (*describing*). Do you still say you would port?—I would port for those two lights.

3112. Now you see that that vessel, owing to your lamp being screened to 2° only, sees your green and masthead light?—Yes.

3113. Therefore there is nothing in the rule of the road that compels him to port?—No.

3114. He might, on the other hand, starboard, might he not?—Would not that be acting against the rule of the road? He knows he is showing me his two lights, and assumes I am porting.

3115. You must assume that both ships alter their helms at once. That is how collisions come about. If you waited to see what that ship did there would be a collision. But that is the difficulty?—The duty of this vessel is to port.

3116. You think so?—Yes.

3117. Now, you see in the case of fine screening, there is a doubt about what that ship will do, and under what article of the regulations she is to act. That ship might say, "I will starboard," and keep under a starboard helm, and this one might say, "I shall port"?—If he does not touch his helm at all, of course, this one in porting will go clear.

3118. But there is always that uncertainty that he might starboard?—Most of the collisions which I know anything about are just caused in that way, where the man has attempted to do what he should not.

3119. (*Captain Hallett.*) Just one question upon that. This vessel, which sees only your starboard light, has no business to touch her helm until you have made a movement; if you have her on your starboard bow it is your duty to get out of the way, is it not?—Yes, it is my business.

3120. Therefore, if you port to her and show her both lights——He will see my two lights as I alter under my port helm.

3121. And then what is his duty directly he sees both your lights?—To port.

3122. And that will take you clear?—Yes.

3123. The Board of Trade, you know, screen to 4°?—Yes.

3124. Upon the assumption that anything inside 2° brings you dangerously close in passing. Do you think with 4° it is safer to port and pass that way, or to continue your course at a known distance of 180 feet? Do you consider that there is room at half a mile on the 4° angle, or do you consider there is any danger in both putting their helms to port?—I should not like to try it.

3125. You would rather give her a touch of starboard helm and go out of it, in fact, you would rather keep your course and pass that way?—That is what I should think of doing; I would not like to try the port helm.

3126. You would not like to try the port helm with another vessel 4° on your starboard bow, and only half a mile distant?—No.

3127. With regard to what you said of a vessel altering her lights. You have that vessel there, and you say if she puts her helm to port she brings her red and white lights nearer together (*describing*)?—Yes.

3128. And you go by that?—Yes.

3129. But now, suppose you had the red and white lights at that angle; if she puts her helm to starboard

she would bring them nearer together, and on that side it would be widened so that you could not tell?—I do not clearly follow.

3130. That vessel puts her helm to starboard; she brings those two lights nearer together, and gradually brings them in line (*describing*). You are here; as she goes under the starboard helm she brings the two nearer together?—Yes.

3131. Supposing, instead of being there, you are here, and she gives starboard helm, now she is widening that angle?—Yes.

3132. Therefore it can be no guide; sometimes she is widening and sometimes she is narrowing the angle as you get to the right or left of the line, which is at right angles to that?—Yes, but that is assuming that the lights are up there.

3133. You advocate their being put there. When once you cross the right-angled line you get the opposite effect?—That is my idea, if she was right ahead, or on either bow as the helm was moved (*describing*).

3134. But how can you tell whether it would put you there. One is under the starboard helm and the other under the port helm, then you cannot tell what she is doing?—But if I had seen as wide an angle as that, I should know the ship was narrowing on me. Knowing the lights were placed in that position, I would know I had her at a very broad angle.

3135. You do not know the beam of the ship?—But it is not necessary, because we are speaking now of the base line from the plane of the masthead light.

3136. It will widen until you get there; there is your broadest place; as you get a little further on your base comes gradually up to there?—As soon as you have passed the broad base you are done with, you are free from danger; of course, if you are on the starboard helm you must port, and then you have to pass that way. It cannot matter at all.

3137. But you cannot tell how she is going?—Yes, you can, she may be going that way or that.

3138. But still it is no guide?—Yes, it is a guide, because which ever way she is going you know she is giving you her broadside.

3139. Do you consider that in practice the difference between putting your helm to starboard and putting your helm to port in open water is of any importance, as regards the amount of power required?—Sometimes they give a very wide sheer. I have found the ship will act better on the port helm than on the starboard, with a right-handed propeller, and while going full speed ahead. Now, with steam gear you can put the helm right over from 45° to 50°, and move her very quickly, and practically, there is very little difference between the port and the starboard helms steering by steam; but by hand, I say it is of great importance.

3140. But in the open water?—In the open water, with nothing in the way, it does not matter how long you take.

3141. In open water it is hardly of any practical importance?—Of very little importance.

3142. (*Sir E. Harland.*) Referring to the masthead light being at some angle or other to the side lights, are you an advocate of having some fixed angle at which the side lights should be abaft the masthead light?—Either in the plane or abaft; I am not particular how far, as long as I know they are abaft the masthead light, and not before. I do not mind.

3143. If you could place those side lights, say, at an angle of 45° abaft the masthead lights in these large steamers, would that be about what you think would be the best thing?—Well, that would be rather small for a narrow beam steamer.

3144. Does it depend in the slightest upon the beam? Does it not rather depend upon the height of the mast-head light? I am referring now to being able to recognise whether the ship is abeam of you or not?—No. I do not think you could tell if she was right abeam or crossing at right angles.

3145. Supposing that the side lights were at an angle of 45° abaft the masthead light, and that you saw the side light and the masthead light at such an angle and such a distance, what would you conclude?—That she was crossing.

3146. You would conclude that you were going fair for her, that she was lying abeam of you?—That she was lying right ahead.

3147. But supposing that that angle was very much less; that it became so ultimately in consequence of her being bows on to you. If you turn that vessel bow on, that angle between the masthead and the side light is very small (*describing*)?—Yes.

3148. Would that be of any advantage to you?—Yes, certainly, I would know she was coming nearly end on.

3149. Then, if when they relatively change, you are able to recognise what course the ship is taking, would that be of any advantage?—Yes, it might or it might not be convenient to me to give a hard port helm or hard starboard helm, as the case might be.

3150. I am referring to the question of your not knowing what course that ship is steering?—Yes, it would be material.

3151. Then would you advocate there being such an arrangement in the future?—I would, decidedly.

3152. Would you prefer another position for those side lights (*describing*). I think you mentioned the lights being plumb with the mast?—Yes.

3153. Would you prefer it to the side light being at some angle, say 45° abaft the masthead light?—Plumb of the masthead light.

3154. Supposing they are plumb of the masthead light, how would yoube able to recognise whether that ship was crossing your bows or not?—The angle would be very small, but I would still have it.

3155. But if it were plumb?—I do not mean up and down the mast, I mean at the ship's side.

3156. But if the side lights were plumb of the mast-head light, and that vessel was beam on to you, then, I presume, you would know that there was no angle whatever?—I should presume she was right beam on to us.

3157. Then, when she was making right for you, the relative angle between the mast-head light and the side light would be due to the beam of the ship?—Yes.

3158. And the height of the mast-head light?—Yes.

3159. Would not that be a very much less angle than 45° generally?—Yes, much less.

3160. Then, would you have the same scope for judging the position of that vessel on that plane as against having the side lights 45° abaft the mast-head light?—I think so.

3161. Would you prefer to have the side lights plumb of the mast?—Plumb of the mast.

3162. Has the idea ever occurred to you of having a second mast-head light down on the stay below the ordinary mast-head light?—What for?

3163. To give you an indication of the course that this vessel is steering?—I would not have any more lights.

3164. You have not heard of that?—No, I would not have it.

3165. (*Chairman.*) You do not think it desirable to have any more lights?—I want no more lights.

3166. (*Sir E. Harland.*) But I suppose you recognise that it would also give you an indication of the course of that vessel?—Yes, it would take a long time to think it out.

3167. Supposing it was so (*referring to the model*).—Then it would become a leading light.

3168. Would you be able to judge by that arrangement what course the vessel was steering?—Yes. I should be able to judge, but it would be very conflicting with the many lights we have about a steamer's bridge; with a leading light under the mast-head light we should not know which was which.

3169. One of the witnesses we have had recommended that?—He may have had a reason for it, but I cannot see any.

## Wednesday, 29th May 1895.

PRESENT:

THE RIGHT HON. SIR FRANCIS H. JEUNE IN THE CHAIR.

Rear-Admiral ANDOE.
Mr. BOLAM.
Captain CASTLE.
Sir FRANCIS EVANS.
Mr. ISMAY.
Mr. SCRUTTON.
Captain THOMSON.

Mr. C. HIPWOOD, *Secretary*.

*Capt. A. Mensing.*

29 May 1895.

Captain ADOLF MENSING called and examined.

3170. (*Chairman.*) You are a retired captain of the Imperial Navy of Germany?—Yes.

3171. I believe you represented the Empire of Germany at the Washington Conference?—I was a delegate from Germany.

3172. I think amongst other things at the Washington Conference you considered the question of screening side-lights?—Yes.

3173. I am not quite sure by what process the Conference arrived at its conclusion; was it considered in committee?—The subject was first mentioned in the Committee on Lights, when a report on trials of running lights and sound signals, by Captain Chadwick of the United States Navy, was submitted. The deliberations of this Committee, of which I was a member, did not, however, lead to any definite proposal.

3174. Perhaps you will tell me, if you can find it, what was the exact resolution at which the Conference arrived?—Certainly. At the first reading an amendment was brought in by the delegation from the Netherlands, by which it was proposed to have the side-lights so fixed that they should cross at a point 100 metres distant from the bow.* This amendment was lost. The next time that the question came up was later on, during the second reading.

3175. When you say this amendment, you mean the amendment to the international regulations?—Yes.

3176. And that had been proposed as an amendment to the international regulations?—Yes. The second time the question came up, the amendment was brought in by the German delegation, and referred to Article 2 of the international regulations. This was necessary, because the articles had been renumbered after the first reading, and the present Article 3 had been given Number 2. The German delegation then proposed that in the present Article 3 the words "more than half "a point" should be inserted after the word seen," so that the paragraph would read altogether, "the said "green and red side-lights shall be fitted with inboard "screens projecting at least 3 feet forward from the "light so as to prevent these lights from being seen "more than half a point across the bow."† This was the amendment that we proposed, and that we hoped to carry. We gave it up, however, in favour of a proposition made by the delegation of Great Britain, who wished that this matter should be left out of the rules, and put into an annex, and we agreed to this. I am sorry now we did, because I think that a great deal of discussion might have been avoided if we had kept to our proposition. The amendment brought in by the first delegate of Great Britain reads: "The side-lights "should be so screened as to prevent the rays of light "being seen more than half a point across the bow," and provided that this regulation should be put in Annex B.‡ As it was adopted this regulation was left out of the rules. This, from the very first, gave those who opposed us a chance of saying that we wanted to make one law in the rules and another in the annex.

3177. Of course as carried out in that form it was not an amendment to the international rules—it was only a regulation outside the international regulations?—I did not consider it so. We had put in this annex a great deal of matter that we thought would make the rules too complicated and that should not be absolutely necessary for a seaman to know; but that, nevertheless, should be binding for the persons fitting the lanterns or making them; we endeavoured to put all such matter in the annex so that we should not overburden the memory of the seaman.

3178. I only mean this: that those who decided to put this matter into the annex and not to make it an amendment to the rules were, I suppose, of opinion that they were not altering the international rules by doing so?—Exactly so. It was the general feeling of all the members of the Conference that that should not be done unless absolutely necessary. We have stated at different times during the discussion of this article that nobody thought of altering the rules; that all we wanted was to state what, *de facto*, had been the rule for some time, and so prevent in future the recurrence of facts that had been brought to our notice in an official way during the sitting of the Conference. These facts, I suppose, I can refer to now. In the report of Commander Chadwick, U.S. Navy, cited above, he speaks about the side-lights of the United States ship "Yorktown," a new cruiser which had been fitted out about half a year previously in the United States Navy Yard, Brooklyn, and says: "I find that the light itself will "show"—I leave out a few words—"across the bow "1¾ points." Now we said if such a thing is possible under the old law there ought to be something done to prohibit it explicitly in the future, and if the matter has not been made stringent enough before, we had best make it so now; because we were convinced that it was a most dangerous practice if, of two ships meeting end on or nearly so, one ship was screened in one way and another in a different way.* The second fact that decided us to bring this matter again before the Conference was a translation of Article 15 that was given to us by the Chilian delegation. It is printed in Volume 3 of the Protocols,† and reads thus:—"It is to be under-"stood that ships are end on or nearly end on if by "day one ship sees the masts of the other in a line with "her own or less than 2½ points out of that line, and "by night if one ship is in such a position as to divide "the two side-lights of the other ship by her stem." We did not understand the meaning of the latter part of the sentence exactly, but when we read this rule we felt that this matter must be settled for good.

3179. Perhaps you would be kind enough to tell me what, in your judgment, it was that induced the Washington Conference to adopt the precise angle of half a point?—Well, at the first meeting——

3180. Excuse me a moment. May I first ask you what, in your judgment, is the meaning of the recommendation of the Conference. What would it be translated into the language of the Board of Trade rule which provides that side-lights are to be screened to an angle of 4°. As compared with that, what does the Washington Conference regulation, in your judgment, recommend?—The Washington Conference recommend that the light, for instance, on the port side, should show across the starboard bow for half a point and no farther, and *vice versâ*, so that the two lights ahead would form an angle of one point, roughly speaking—of one point before the bow, in which space both side-lights should be visible, so that each light is seen half a point on the opposite side of the amidship line or the line of keel.

* Protocols of the Proceedings of the International Marine Conference. Washington text, vol. I., p. 220 sq. British text, Parliamentary Paper C. 6133, p. 109 sq.
† Washington text, vol. II., p. 1156 sq. British text, C. 6255, p. 185 sq.
‡ Washington text, vol. II., p. 1166 sq. British text, C. 6255, p. 190 sq.

* Washington text, vol. II., pp. 1162-1164. British text, C. 6255, pp. 188-189.
† Washington text, vol. III., p. 44. British text, C. 6132, p. 118.

3181. So that they recommended screening at an angle of about 1½° more than the Board of Trade recommend?—Yes, exactly so.

3182. Translating it into an exact number of degrees, the Conference recommended that each light should be screened to an angle of 5⅝ degrees?—Yes.

3183. Now perhaps you would kindly tell me how it was that you induced them to prescribe that precise angle of half a point?—When the subject was discussed for the first time there fell from the first delegate of Great Britain a remark which made a very deep impression on us. It had been proposed, as I said, to have these lights so fixed that their rays should cross the bow at a certain distance, say, 100 metres. Mr. Hall (now Sir Chas. Hall) objected to this and said that it was impossible to adopt such an amendment, as the rule would apply to ships of different breadths of beam, and that it would be much better to take the angle of vessels from the keel.* He then explained that, according to the instructions issued by the Board of Trade, the lights should cross before the bow at a distance, which about equals five times the beam of the vessel, and that this would give us an angle of 5°. Now when the German delegation decided to press this matter we naturally wanted to make our proposition as safe to follow as we possibly could. As the fixing of the screens had been left in Germany rather to the good judgment of the captains, we had nothing from our own country to offer that would fulfil this condition. So we were very glad to be able to fall back on this rule of the Board of Trade. We said to ourselves, here we have a rule that has been in force for a number of years, that has never been complained of, and to our knowledge never has caused an accident. As we understood it, this rule was that the lights should be made to cross five beams before the bow. Now, if we take the tangent of half a point, we find that that corresponds to the ratio of $\frac{1}{10}$ even better than that of the angle Sir Charles Hall proposed to us, viz., 5°.† If we assume that a ship's side-light stands at the distance of half a beam away from the line of keel and that the lights are to cross at 5 beams' distance before the bow, this ratio is $\frac{1}{10}$, and this corresponds very nearly to the tangent of half a point, whereas the tangent of 5° corresponds to the ratio of 87 : 1000. The other reason was that we did not want to make the point of our rule too fine, so that a magistrate or judge not fully conversant with matters nautical might not be led into ruling a case out of court, if, for example, a ship, otherwise not to blame, was proved to have the side-lights screened to 4° or 6° instead of the 5° prescribed by the rule. I think these were all the reasons we had in bringing in our amendment, and I believe our views were shared by a good many members of the Conference. At least we were told this in private conversation, so that we were pretty sure that our views represented those of the great majority of the Conference even before the discussion had begun.

There is one little thing, I think, I had better perhaps explain here. I have seen it stated in print in one of the marine journals of this country that I am supposed to have committed a blunder that eventually caused the Conference to adopt a resolution which was the opposite of what they wanted to do. Now this is entirely a mistake, though it may have been caused by the text of the official Protocol itself. But the Protocol cannot be considered in any way an accurate account of what I actually said. There was only one stenographer at Washington, who was sitting opposite to me at the end of a long table, around which, sometimes two or three deep, the 60 delegates sat. There was naturally a good deal of conversation going on amongst them. I am in the habit of talking rapidly, and easily get a bit excited, so it must have been very hard for the stenographer to take down what I said.

However that may be, I found after one or two trials that it took too much time to correct the stenogram, as I had a great deal of Committee work to do. So I soon gave this up altogether. Of course, I alone am to blame if the Protocol became inaccurate in that way, but so it actually is.

3184. Let me call your attention to what you are supposed to have said and upon which perhaps the misconception has arisen. I have got it here in the Blue Book. I do not know whether it is in the corresponding page in that volume?—December 1889, you mean?

* Washington text, vol. I., pp. 221-222. British text, C. 6133, [illegible].

† Tangent of 5° = 0.08779. Tangent of half a point = 0.00934.

3185. Yes, the words are,* "There is very little more "to be said except to explain how we came to adopt "the angle of half a point. As far as I know there are "only two countries in which the Rule where the "lights should cross each other before the bow is "accepted. One is Denmark, in which country the distance is settled to be about a cable's length which "would be 185 metres, so the angle would be much "less than the one which we propose now; and the "other country is Great Britain. There is a table here "from which I get the French translation, in which it "says that for the beam of a ship 20 feet broad, the "shortest distance at which these rays should cross "each other is about 200 feet; that is to say, the rule "laid down by the Board of Trade comes practically "to this: that at the distance of 10 beams or 10 times "the breadth of the beam there should be a distance "before which these rays of the side-lights should not "cross. That makes half a point." Now is that accurate?—That is not accurate; why, I knew all the time, as I have told you before, that it was five beams Sir Charles Hall recommended to us. You will find the reference to the five beams on page 221† of the Protocol, Vol. I. Now if you take the angle of 5° it gives you a distance which about equals five times the beam of the vessel; that was the rule he gave us, and that was the rule we followed, I want also to call your attention to page 1178.‡ I think it is here somewhere where I speak about this.

3186. (*Mr. Ismay.*) Is that where you speak of the Board of Trade being considered a body of some authority?—Yes, there I said it again. I knew all the time that if the rays of the side-lights were made to cross at 5 beams' distance before the ship, the corresponding angle would be about 5°, and that is the only explanation that I can give you now. I have not got anything to go by except my pretty good memory, but I believe that at this place I made use of the expression "half a beam." If you will kindly look at page 1163§ of the Protocol, you find a diagram there that I drew, and that, I hope, proves that I was well aware what I was talking about, particularly if you will carefully read this sentence:— "But here we have got it proved by actual measure- "ment that in one of the latest ships this angle has been "increased to 1¾ points, so that in front of the ship "these lights have 3½ points on each side." This may not be very good English, but I am sure that anybody comparing all this will hardly find me dull enough to confound these two angles, and to really have committed the very apparent blunder I stand accused of, nor the Conference careless enough to have been led astray by it.

3187. Now would you consider it a dangerous practice to screen lanterns so as not to allow any of the rays of the side-lights to show across the bow?—I would not only consider such a practice dangerous, but I would, at the same time, believe this to be in direct opposition to the spirit of the existing rules. In order to prove this I think I shall have to refer to some experiments made at my recommendation by the Physical Technical Institute of the German Empire then under the charge and presidency of the late Hermann Von Helmholtz. They were executed by Messrs. Brodhun and Lichtenthal, both doctors in philosophy and men of science, for years accustomed to photometric measurements of precision. The photometer used was lately constructed by Doctors Lummer and Brodhun. It is about the only one that allows the power of differently coloured lights to be measured with some degree of accuracy. The unit of light was the well-known Hefner lamp, the power of which is about equal to 0·8 of an English standard candle. The result of these experiments may be considered absolutely reliable within narrow limits, say, 2 per cent. The side-light experimented with was made by Herr Schulze, of Berlin, one of our best German makers. The screen used with it was one metre long, which is equal to about 39¾ inches. Instead of the wooden chock, usually used, a thin iron plate with a sharp edge was fastened to the screen, which made a better cut off than a chock. The whole arrangement was mounted on a turn-table, provided with a division in degrees and half degrees, so that the screen could be made easily to form any desired angle, with a line connecting the light and the photometer. The line in which the eye of the observer could just see the inside edge of the flame clear of the

*Capt. A. Mensing.*

29 May 1895.

edge of the iron plate at end of screen served as line of reference. The results derived from these experiments have been put by me in a tabular statement which I lay on the table.* The different measurements are given in it exactly as they were given me by the officials. It is easy with these results to draw a curve, showing in what ratio the power of the side-light is gradually diminished by the interference of the chock and, again, how the distance at which the light can be seen will be lessened correspondingly. I have one of these diagrams† which I would like to submit to the Committee. In order to explain this diagram, I would like to say that I have assumed the light at its full power to be visible two nautical miles. The line L M represents the prolonged midships line; if the light should be so screened as not to allow any light to be seen across the bow, in the trumpet-shaped space P L S none of the side-lights would be visible.

3188. (*Mr. Ismay.*) May I ask if Captain Mensing gives us to understand that if the lights do not cross the bow there will be a dark lane for two miles in advance?—Certainly.

3189. (*Sir F. Evans.*) That is, presuming your ship keep on a steady course?—I will come to that.

3190. (*Chairman.*) You are taking the case now, as I understand it, of the whole of the rays being screened off?—Exactly, screened off so that none of them can be seen across the bow.

3190*a*. That is to say, the chock being screened from the outer side of the wick or flame in a line parallel with the keel?—Exactly. In that case none of the lights will be seen inside the curves P L and S L.

3191. (*Rear Admiral Andoe.*) Then you cut off the light entirely?—Entirely.

3192. (*Mr. Ismay.*) The diffused rays as well?—If you notice in the diagram at the very beginning the green and red lights show together, that must not be entirely left out of consideration.

3193. (*Sir F. Evans.*) You say you put the chock right in front of the wick?—No. At 3 feet distance I screen the light so that none of its rays can be seen across the bow.

3194. (*Mr. Ismay.*) What about the reflection? Suppose a lens between your eye and the light?—The lens of a ship's side-light influences the direction of the rays of light only in a vertical direction, so that all the rays of the flame are compressed into a flat luminous disk directed to the horizon. But if the lens is properly constructed and the light is in focus, their azimuthal direction is not altered at all, so that a ray always remains in the same vertical plane.

3195. (*Chairman.*) I was just going to ask you, is that the result of actual experiments?—Actual experiments.

3196. Or theoretically?—Actual experiments. If you will give these figures I have given here to any one conversant with optical science he will certainly come to the same results as those on which this diagram is based. I am quite sure of that.

3197. They are worked out. I do not profess to be skilful enough to do it myself, but they are only worked out from these figures given in this table?—Exactly. Now I would like to explain that though I consider this dark space extremely inconvenient, I yet consider the greatest danger of such a manner of screening to lie in the fact that nowhere can the two side-lights be seen at the same time together. This fact, I believe, is proved conclusively by this diagram, yet it is so little understood. People generally seem to think that in some mysterious way, notwithstanding this dark space separating them, the two lights can be seen together right ahead. This diagram, I believe, goes far to show that this is *impossible*. Of course if the ship yaws, one of the ship's side-lights—say the red, —may become visible to another ship meeting this end on. And the red light may be followed, after seeing none of the lights for awhile, by red turning up again. But you may just as much expect green to appear or both lights to remain invisible. Now I should like to appeal to those gentlemen in this Committee who have been following the sea to bear me out, when I say that such a state of things would be intolerable, and would lead to indecision, to doubt and uncertainty, and, ultimately, to confusion; and confusion and uncertainty are the two things that bring about, to my way of thinking, more collisions than all other causes put together. For these reasons I am very much opposed to any kind of screening that would allow a dark space anywhere to be seen right ahead of the vessel, so that only one light can be seen at a time and never both together. And such screening, as I take it, would not only be against Article 3, which provides that the light of a side-light shall be unbroken and uniform from right ahead to two points abaft the beam, but would also be against Article 15, because this clearly starts from the proposition that both side-lights shall and must be visible ahead of the vessel at the same time. This, I repeat, can only he done if the two lights are made to cross before the bow. I even go farther and say that if it should be decided to have the lights screened so that they do not cross at all, Article 15 would no longer have any meaning for navigation at night. For it distinctly provides that it does not apply to cases in which a green light is seen without the red, or a red light without the green ahead or anywhere else, and that is just what would happen if the side-lights are not allowed to cross at all.

3198. May I ask you, Captain Mensing, whether you consider the proposed angle of 4° is a good one?—Yes, I believe this to be the case; and, in order to make my views on this point clear, I have another diagram here which I beg to submit. By looking at this diagram it will be easily understood how broad the space would be, in which both side-lights will be visible if they are screened, so that they show 4° across the bow.* I have taken again here, as line of reference, the midship line of a ship. Now, if the ship's lights are so screened that the uttermost rays do not go beyond 4° across the bows, then these two lights will not show in all that space which is bounded by the two straight dotted lines forming an angle of 4° with the line of reference, as generally has been assumed so far; but they will only be visible within the space P L S, *i.e.*, as far as the green and red lines extend. Only in this space can you see the two lights together. In all other places, for instance, *here* and *here* and over *there* you could only see one. (*The witness explained the diagram to the Committee.*)

3199. Now I wanted to ask you this. Do you prefer 4° to the finer angle of, say, 2°?—Yes, I do.

3200. Why?—Because it would never do to leave a space right ahead of the vessel at which only one light would be visible, or none within the distance of two miles, and because I cannot doubt that the observations made at Charlottenburg are correct. It seems to me that any angle smaller than $2\frac{8}{10}$ degrees need not be considered.

3201. Smaller than $2\frac{8}{10}$ degrees?—That is the angle given in the table I submitted as the utmost limit at which a light screened as described would become practically invisible.

3202. Why do you fix upon $2\frac{8}{10}$?—Because, with an angle of 2·8° and with a screen $39\frac{3}{4}$ inches long, the light becomes invisible at such an angle. When the chock gets between the eye of an observer and the light, its power is gradually diminished, till, by turning the screen through $2\frac{8}{10}$ degrees, the light becomes invisible.

3203. Why do you put it *here* (*pointing*)? This is the point at which he would cease to see the outer rays of the light?—Yes.

3204. This is a starboard light?—Yes. From *here* the light would show about *here* full power, and it would gradually diminish from this point to *that*. *Here* it becomes extinct and invisible.

3205. It has crossed the middle line—I do not know exactly what distance it is?—If it has crossed the middle line before the limit of two miles the area in front of this ship must always become more and more similar to that drawing that I gave you, in which I have assumed that the side-lights of a ship are arranged so as not to show across the bow at all. A space so lighted would give rise to the objections which were pointed out by me before.

3206. That dark space would be no great distance, would it?—Do you know exactly how much it would be?—That would be about 2°. It might be about *here* (*describing*).

3207. About *there*?—Yes. But I believe I have explained before that I do not consider the existence of this dark space in itself as a very formidable danger, but more the fact that such a mode of screening makes it impossible to see both lights at the same time.

* *See* Appendix 8, No. 1. † *See* Appendix 8, No. 2.

* *See* Appendix 8, No. 3.

3208. Would you see any objection to the lights being screened 2° instead of 4°?—Why, certainly.

3209. Why?—You would have that space *there* (*pointing*) in which you would see no lights, or, if the ship yaws, only one at a time.

3210. I thought you were good enough to say you did not attach any importance to that blank space?—That space would make it impossible to see the two side-lights at the same time, and I must see them if I want to navigate with safety.

3211. Does it matter if you do not see the two lights at so close a distance?—It would be about a mile and a half off.

3212. Two miles?—About a mile and a half, but wherever it would be, if I do not see the two lights together at the same time when right ahead of a vessel and steering for it I consider that very dangerous indeed, and I insist upon it, that in the interest of safe navigation it is necessary to arrange the screens so that both side-lights are visible right ahead of the ship up to the full distance of two miles.

3213. Then do I understand your view to be that no crossing is admissible that would make any dark space ahead of the vessel?—Yes, that is exactly so.

3214. Then the lights, if that is so, ought to cross at the bow?—They do.

3215. Do they?—Certainly, with the screening here.

3216. Cross at the bow?—Cross at the bow. That is to say, of course, I do not mean to say that they do so at the stem itself. I have left the distance between the two lanterns entirely out of consideration, because that would complicate matters; I mean at the bow *there*, so that these lights should be both visible at, say, about 100 feet from the stem.

3217. That is not at the bow?—Oh, I beg your pardon.

3218. That is exactly what I said, because it comes to this, if you do not insist on the lights crossing at the bow—I mean by the bow, the actual stem of the vessel?—Yes.

3219. Then there must be some space which is described as dark space ahead of the vessel?—Certainly, in every vessel where the side-lights are not placed back to back there must such be a dark space. But I do not consider *this* as a source of danger. If I am within 100 feet of a vessel, it makes little difference whether I see the side-lights or not, at least not if I am in a big steamer going at full speed.

3220. Quite so, that is exactly what I was venturing to point out?—That is so.

3221. Then do I understand you to say that you approve of the Board of Trade Rule which is that lights are to be screened to an angle of 4°, calculated from the outside of the wick?—Oh, no, I have never spoken of the wick, I think the wick had better be left entirely out of the question. What we want to regulate is the light—the flame is the thing. If in such rules as are now under consideration a wick is spoken of that is simply a matter of loose phrasing.

3222. Then I understand you do not approve of the Board of Trade rule which directs 4° of screening, reckoned from the outside of the wick?—Well, I understood the rule of the Board of Trade differently. I believed the rule referred to the light and not to the wick.

3223–4. The flame?—The flame. That is what we had in mind and discussed at the Washington Conference. The wick has nothing to do with this rule.

3225. Now may I put my question to you in this form. Take it from the flame. If you approve of 4°, why do you say that in your view 4° would be preferable to 2° screening from the outside of the flame?—As I have said before, I consider every mode of screening unsafe which does not allow both lights to be seen together right ahead of the vessel up to the full distance of two miles. And I think that Article 15 explicitly requires that these lights must show at that distance, both of them.

3226. So they would, if they crossed at 2°?—They would not, certainly not.

3227. Why not?—This line *here* is $2\frac{1}{10}$ degrees away from the line of reference. Therefore, if the lights only show across the bow 2°, that is not sufficient to make both visible together right ahead at the distance of two miles.

3228. (*Captain Thomson.*) That is where the point comes in again—all the rays were screened off?—In order to make what I say perfectly clear, I will, with the greatest pleasure, bring you another drawing to-morrow, which will prove what I tried to explain; but if you will imagine that in the first drawing* this curve P L is turned two degrees nearer to the line of reference, and the other curve P L the opposite direction, there must result a dark space ahead of the vessel, which must be carefully avoided.

3229. (*Chairman.*) Do you mean if the lights were screened 2° from the outside of the flame that the red and green do not cross at any point?—I beg your pardon; up to *this* distance, perhaps ¾ to a mile and a quarter they would cross, but I cannot tell you now the exact spot where the dark space would begin, on which both lights are invisible right ahead of your vessel.

3230. (*Captain Thomson.*) When you draw that curve are you not assuming that the screening will be the same as in this diagram, the only difference being no degrees instead of 2°?—I would like to point out that the values I give you are minimum values, and that when you introduce a shorter screen the angle will be larger, and consequently *this* space considerably larger too.

3231. Suppose the case in this diagram; you have screened all your rays off?—Yes.

3232. No rays whatever are to be seen?—No rays whatever across the bow.

3233. You understand that would not be the case if you screened from the outside edge of the flame—I suppose you would not give much attention to that?—Well, no.

3234. (*Mr. Scrutton.*) *That* is the point at which the rays cross?—Where the lights cross.

3235. Kindly give a short sketch and follow that out. I want to see where the side-lights will be for you to get this result?—From *here*.

3236. But in order to get *there* you have got the lights behind you. You deal with that by screening in a certain way. I want to see what the position of the lights is?—I would like to explain that the scale not allowing to take into consideration the distance between the two side-lights, I had to mark their positions by one spot, as if they had been placed back to back.

3237. The lights are together?—I have assumed them to be together. If they were 40 feet apart—the drawing is on such a scale as to reduce that distance to a fraction of a millimetre, and if I had not left that out of consideration the consequence would be that this line, say L S, would be brought a little further over *here*, it would, however, remain perfectly parallel to the one drawn.

3238. (*Rear-Admiral Andoe.*) Take it that the line from the inner edge of the flame or the inner edge of the wick to the outer edge of the chock is parallel to the keel, according to the old rule, what would the effect be, if that allows the full stream of the light to go straight ahead without anything standing in its way?—Whenever you put a chock in front of a light that makes a difference.

3239. Why put it in front of the light?—In this case each side-light would show across the bow through an angle of 2·8 degrees, though with gradually diminished force. The old rule left this fact entirely out of consideration.

3240. I remove *that* now and put it *here*, *that* is a line drawn from the inner edge of the wick parallel to the keel according to the old regulations, and that allowed the whole flame of the light parallel with the keel straight ahead of the ship?—I beg your pardon; that would again create that penumbra.

3241. It would cross the bow *here*?—It would certainly cross the bow.

3242. (*Chairman.*) This is a diagram which has been prepared by the Board of Trade, which shows the screening at 2°, at 3°, and at 4°, and it shows the effect of the present rule of the Board of Trade, 4° from the outside of the wick. Now, you will observe that at 2° the line crosses at 716 feet in the case of a vessel of 50 feet beam. Now, if that be so both lights would be seen by any vessel further off than 716 feet?—

* *See* Appendix 8, No. 2.

*Capt. A. Mensing.*

29 May 1895.

The assumption on which this drawing here rests is all wrong.

3243. Will you please tell us why that is so?—You see the prolonged line drawn from the outside of flame to edge of chock is given here as the limit of visibility of the side-lights across the bow. This line is drawn as a straight line up to the distance of two miles, 12,000 feet. It is therefore assumed that the light just inside that limit is powerful enough to be seen at two miles' distance, in other words at its full power. From a point 2·8° away from this line, the light, however, has gradually been diminished in power by the action of the chock, till the power near that limit given by that straight line has become nearly *nil*. In drawing the diagram this fact has been entirely left out of consideration, otherwise the limit would have been made a curve instead of a straight line, as in my diagram. I know what I say may be new to you, and perhaps a little startling, as I have found the same difficulty in making myself fully understood before, but, gentlemen, what I tell you is true. If you will give me time I will show you any day you choose the whole process how these drawings originated—it is a very simple one. Should it not be possible to repeat the experiment here, all that is necessary would be to get a lamp and a photometer—the poorest one will do—and you will see then for yourselves that these drawings are absolutely reliable. Or, if you have no time for that, you might get some scientific person acquainted with photometric measurements to repeat the experiments and report to you. I find it very difficult to make myself better understood at the present moment, but let me try once more: Now, will you kindly (*holding a piece of pasteboard at a right angle to palm of hand*) consider my outstretched arm the screen of a side-light, and let my eye represent the flame of the lamp. If you will kindly close your left eye now you will at first see the whole of my eye, as you would see the whole of the flame. Now I gradually turn my arm till the half of my eye has become invisible to you on account of that pasteboard representing the chock, which now cuts off half of my eye, *i.e.*, half of the light of the lamp. I turn my arm further: now the whole of my eye has become invisible, in other words, all the rays of the light supposed to issue from my eye have been cut off. In a similar manner the power of a side-light is gradually lessened till it becomes nil.

3244. (*Mr. Bolam.*) You find, in fact, there are two things which will cut off light from being seen. One is the screening, and the other is absolute distance?—Certainly; yes.

3245. I think in that diagram no attention is paid to the fact that the intensity of the light varies inversely as the square of the distance?—Exactly.

3246. They assumed that the outer wick rays will penetrate just as far as the powerful rays?—I am very much obliged to you for putting it in that way. That is exactly the mistake that has been made.

3247. The point was brought before us by one witness—a very able surveyor from the Tyne—Mr. Ramsay, I think?—I do not know.

3248. (*Captain Thomson.*) I should like to ask you one question, which I am not quite sure has been put quite clearly, as to the power of the light you would see with 4° screening; whatever the power of the light may be, you see it equally all over within an arc of 4°?—No, I beg your pardon; the Washington Conference meant that the angle should be arranged so that at ½-point none of the rays should remain visible.

3249. That is screening from the outside of the wick. Now, suppose we screened from the inside of the wick for the sake of illustration?—Then you have got the full power of the light ahead.

3250. Then the screening effect according to the law of the square of the distance would not take place if you saw the whole flame?—Certainly not, because you know what the rule is, that the distance at which lights of different power are visible vary in the inverse ratio of the square of their intensity.

3251. Therefore that only applies to what we may call minor rays?—To the minor rays then.

3252. (*Chairman.*) I understood you to prefer 4°, because you think that in the case of 2° the lights would not practically cross one another at any point sufficiently near to the vessel?—No, it is because their limits of visibility would cross before the full distance at which the light should be visible.

3253. Not cross sufficiently near?—Yes. I would like now to point out that the values I give here in my drawing are minimum values, and that the angle measured would undoubtedly have slightly exceeded 2·8 degrees, if the screen had only been 36 inches long instead of 39¾ inches, and if the chock had been made of wood instead of thin sheet iron; but that is not all that has to be considered. The flame used in the side-light might well possess a larger breadth or diameter than the one experimented with, and that too would widen the angle above the limit given. And, again, I would consider it unwise not to leave a certain margin of safety. It is very difficult to fix such a screen so that the cut off is accurate within the limit of ½°. Wooden screens warp, iron ones bend easily. Both may be injured and their position altered by casualties. Again, the lantern may be lost at sea, and may have to be replaced wherever chance offers, and the second lantern may not be identical with the one lost, and they may not have at hand the means or the persons qualified to make the alterations necessary. With all this before me I cannot but consider a margin of 1° only as one that barely provides for the necessities and difficulties inseparable from a ship's life at sea. I therefore come to the conclusion that a smaller angle than 4° cannot be considered in any way a safe one. Besides this, I do not believe that such an angle would be permissible if you consider Article 15 a little more closely, for Article 15 is founded on the supposition that both side-lights should be visible at a distance of two miles if the ships are meeting end on, or nearly so. With the English length of screen of 36 inches only, the angle through which the light gradually diminishes in power cannot be taken at less than 3°, and the angle through which the lights are seen across the bow must be made larger than 3° if you want to comply with Article 15. This is another reason why I would consider it wrong to make the angle in question less than 4°.

3254. (*Rear-Admiral Andoe.*) I want to ask you a question regarding the screening of the side-lights. The old regulation of the Board of Trade was that the inner edge of the wick to the outer edge of the shock should be a line parallel with the keel, is that right?—Yes.

3255–6. I say the wick because it was originally printed wick, but as this is said to be a mistake, we will presume that the inner edge of the lens and the inner edge of the wick are in a line for this purpose. Now I want to know, theoretically considered, if there is nothing whatever in front of the flame or in front of the wick, what objection is there to that rule being continued, so that the whole of the brilliancy of the lamp should show right ahead in a line with the lamp itself allowing the rays from the wick to be sufficient to cross the stem of the ship or rather the path of the ship in advance of the stem?—When that rule was made the lamps used colza or rapeseed oil, and in these old-fashioned lamps the flame of the lamp went up straight and therefore the wick and the flame were about of the same width; therefore it made very little difference whether you spoke of the diameter of the wick or that of the flame. If you will take now a modern petroleum lamp such as you find in most of the ships at the present day you will find that the flame spreads out. If the light could be so fixed that the inner edge of the flame and the outer edge of the chock should be parallel to the line of the keel, the light on the starboard side would show $2\frac{8}{10}$° across the port bow and *vice versâ*, and if you could be sure of having the same lamp, and if you could be sure of having the screen in a perfect position and that it would remain so, I do not see that there could be any great danger if you adopted that mode of screening; but you must not forget that the $2\frac{8}{10}$ degrees that I mentioned were arrived at under somewhat different conditions than those you would meet with in this country. The screen was a little longer than the one you would have here, and the light would shine over to probably 3°. But why do you wish to make that angle less than 4°? To my way of thinking there seems to be very little reason for doing this. I believe I have showed by the diagram I laid before you beyond reasonable doubt that with a lamp and screen such as we used in Charlottenburg the extreme width of the space through which both lights would be visible is not greater than the length of one of our modern steamers, and I am sure that nobody can consider that any real source of danger.

3257. Allow me to ask whether if the old regulations were continued you think that it would increase the risk—that there would be any great risk of collision in consequence of continuing the old regulations?—I do not believe there would be any very great danger if the old regulation of the Board of Trade should remain in force, only the wording of the Rules should then be altered to suit modern conditions.

3258–9. I presume also that you lay stress upon the lantern being of uniform pattern so as to insure the wick always being in the same position as regards the screening?—I am very doubtful about that because I would like to ensure the liberty of making the lamp more perfect—the reflectors more perfect, the power more perfect, and I am very much afraid that if you fixed all these items by regulations the lampmakers would not make any progress.

3260. Could they not accurately fix the position that the wick should hold in the lamp with regard to the screening?—Yes, but, as I explained before, in a well constructed lamp the lens has no influence whatever on the azimuthal direction of the light if the lamp is in focus. I have seen it stated that the whole globe of the lamp would become one luminous mass, whereas in fact it does not.

3261. The wick should be fixed in a definite position in the lamp, should it not?—Of course it is absolutely necessary to see that the flame is in focus.

3262. And therefore, for this reason, should there not be uniformity in lamps? I mean in regard to the lamp itself, putting aside the lens?—I remember that in the old regulation of the Board of Trade there was such a prescription, but I consider it, as I said, of doubtful value.

3263. Doubtful value?—Doubtful value. To illustrate my point let me mention that an institution, not the Board of Trade, issued some years ago rules by which the use of cylinders in lamps, and the use of separate red and green panes of glass for colouring the lights was forbidden. No doubt it acted in what it considered the best interest of navigation, yet you all know, gentlemen, that nowadays petroleum lamps without these two fittings would be considered antiquated. Lamps, wicks, chimneys, reflectors, oils are being improved all the time, and I consider it to be in the best interest of both services that lamp makers should not be tied down by rules unless it is absolutely necessary.

3264. If you at one moment place the wick so many inches from the screen, and then you get another lamp in which the wick occupies a different position that alters the angle at once?—Certainly; that would place the flame out of focus at once, and that would be a most dangerous practice. I have had a lamp in my own hands, which was shown me by a lighthouse official on the other side of the water, as a kind of curiosity. The wick was inches higher than it ought to have been, so that no light from that lamp could be seen by an observer in the same horizontal position as the flame.

3265. There is one point which I should like to ask you; at the Washington Conference, can you tell me whether the merits of fine screening as opposed to a screening of half a point were taken into full consideration, did they argue the point out?—No; there was never a finer point of light discussed than 5°. I have seen it mentioned, I suppose, as a good story, that the Committee one day was discussing an angle of 2½°, but that after having had lunch they doubled the angle and adopted one of 5 degrees. I would like to state here that this story is without the lightest foundation.

3266. You are quite clear that the conference distinctly intended to recommend that each light should be screened to an angle of half a point?—Certainly; most certainly.

3267. (*Mr. Ismay.*) With regard to what Admiral Andoe just asked you, when you arrived at the half point, had you made any experiments?—No, none whatever.

3268. You thought that half a point would be easily remembered by sailors?—Yes, and at the same time I remembered what Sir Charles Hall told us that an angle of 5° would very well agree with the existing English rule which had proved its value in actual practice.

3269. And you regarded with favour the principle of regulating the lights by means of the angle of screening?—Yes.

3270–1. Do you think that the danger of fine screening is greater than the danger of broad screening?—It will all depend of course on the limits. Broad screening over to one point on each side, or to 1¾ points, I would consider dangerous indeed.

3272. In an ordinary ship the rays of the light are visible from the stem-head of the ship when they are screened at 4°?—Yes, but the light there is very weak, and is only caused by the reflection of bright metal in reflecting surfaces besides the reflectors, or imperfections in the glass of the lens.

3273. The same screening might be used for the electric light as for oil lamps?—As far as I know, you would have very little trouble in fixing an incandescent lamp of about 16-candle power, or 32-candle power to a side-light; the diameter of the source of light in this case is much smaller than that of the flame of an ordinary lamp with a wick of 1-inch diameter, and a flame of, say, $1\frac{5}{10}$ of an inch in diameter.

3274. (*Captain Thomson.*) I think you told the Committee that experiments were made with side-lights on board ship, and that the lights were not seen to precisely the screening angle?—Yes.

3275. Can you explain why that happened?—The chock when it gets between the observer's eye and the light cuts off more and more of the flame, so that its power is gradually lessened until none of the rays of the light can reach the observer's eye, and the light thus becomes invisible.

3276. I understand you do not think the lens becomes luminous and reflects light to any great extent?—A very faint gleam of light will be given out by the lens—that is due to the reflection of the setting and the imperfections of the glass. In a perfect lamp without flaw or fault—without any air bubbles in the glass or scratches and which has no other reflecting surfaces than the reflector in the lantern, the lantern cannot give out any light if the flame itself has become invisible by the action of the chock.

3277. I understand you mean that with proper plano-convex annular lenses, such as are used in lighthouses, you only see a vertical line of light?—Yes.

3278. And that should be the case with ships' side lights?—Yes.

3279. But in ships' side-lights the lens does practically become luminous?—Yes, but to so slight an extent that I do not consider it necessary to take it into consideration here, because this light cannot be seen beyond 100 or 200 yards under the most favourable circumstances.

3280. Assuming a powerful light is screened to no degrees from the outside of the flame, do you not think the lens will become luminous an over arc of 3° beyond the screening line?—No; and in order to satisfy you on that point I would like to refer you to the tabular statement* which I have submitted to you. Here we have got the full power of the white light at 60½ units, and after turning the lantern through $2\frac{5}{10}$ degrees, counting from the lines of reference, the light was reduced to $\frac{1}{10}$ of a unit. That was white light; the red light was reduced from $4\frac{3}{10}$ units to $\frac{3}{100}$, and the green from 5·4 units to $\frac{1}{100}$, so that at these points of the original light nothing was left but a very faint glare.

3281. Do you think that the green is as powerful a light as the red light?—That will all depend upon the intensity of colouring. Coloured glasses act on light passing through them in very much the same way as a sieve on other matter; if you take a sieve and put flour in it, with a wide meshed sieve only bran will be kept back. If you take a finer sieve the coarser flour will be kept back too, and at last only the very finest flour will pass. So with coloured glasses; some will retain all red rays, so that only rays can pass that appear to the unaided eye purely green, and others will allow some red rays to pass besides the green. In the first case the power of the light will, of course, be weakened more than in the latter case. Of course, glass may contain besides the colouring matter some other obscuring substances that prevents the rays from passing. Then a further lessening of the intensity of the light takes place. However that may be, in these experiments the green light was stronger than the red.

3282–3. I believe you think that according to the present international rule of the road both lights should

* *See* Appendix 8, No. 1.

*Capt. A. Mensing.*

29 May 1895.

be seen simultaneously?—Yes, if the observer stands right ahead of the ship, or nearly so.

3284. What limits would you give to the expression "end on or nearly end on"?—I think if you would take 4° or 5° that would be about right.

3285. Do you think the screening of the sidelights or the angle through which they would be seen across the bow should correspond with the limits of right ahead or nearly right ahead?—Yes, I should think so, because I think it would not stand to reason to have one law for the night and one law for the day.

3286. At what distance would you have the actual angle correspond with the screening angle—practically at what distance would you think it most important that these two lines should correspond (*pointing on the diagram*)?—They would only correspond just at the beginning—say, up to 150 metres.

3287–8. It would be possible by altering the screening to make the visibility of the light correspond with this line of screening?—If that was done of course the angle *here* would be in excess, but I think that the angle of 4°, which has been proposed by the Board of Trade, is a very good one, and I do not see any reason why that should not be adopted. I think it will meet all practical requirements, and I do not see any reason why it should not be adopted.

3289. You think an angle of 4° makes the lights cross properly?—Yes.

3290. (*Mr. Scrutton.*) Supposing Article 15 to be expunged and a new one had to be written, would you write it in the same way, or do you think it faulty?—I think it would be very difficult to make a better definition of what a ship ought to do under the circumstances this article refers to than the one we possess. There is one point, however, I have already alluded to that might be improved, and that is the phrase "that the masts must be in a line or nearly in a "line."

3291. That is a different affair. I was merely speaking of the night. You think it is as satisfactorily expressed as it could be?—I think it is.

3292. What would you say supposing you were talking with a captain of many years' experience, working up and down the English coast, who says "my desire "always is to see one light as far from my ship "as I can?"—That desire has little to do with the Rules of the Road. The captain's idea apparently is to get away from all kinds of vessels as far as he conveniently can, and I consider him a sensible man. I have seen that principle applied not only in men-of-war but in the Atlantic ships.

3293. Then I understand you to say that you read Article 15, that at two miles off both lights should be seen?—Yes, ahead of the vessel.

3294. Two miles?—Yes, ahead of the vessel.

3295. Two miles?—At two miles both lights must be visible together, and I think every captain would be in a very awkward predicament if at two miles right ahead these two lights would not be visible.

3296. Do you think the two things are reconcilable—that according to Article 15 the two lights are to be seen right ahead, and that when the lights are one point on either bow they are to be deemed as right ahead. Taking that as the interpretation of the law, do you consider the two views can be dealt with, that the two lights are to be seen two miles ahead, and yet the captain says I desire to see simply one light, and that as far off as possible. Do you think these two conditions are reconcilable?—Certainly; what I propose doing, and what I think is absolutely necessary, is that both side-lights of a ship should be visible at two miles by an observer standing right in the line of the keel.

3297. From a point on either bow?—I beg your pardon, I do not say that. If a court should have decided so all I can say is that I, as a sailor, would consider that decision wrong.

3298. (*Mr. Bolam.*) Of course, all of us quite willingly and completely accept your statement that you made no mistake in doubling that quarter of a point, but would you allow me to point out that the statement occurs so often in the English Report that a notion of that sort was not unreasonably entertained?—I never felt very sore about this imputation as I soon found from the report that I really could very well be supposed to have made this mistake. Of course if anyone had read the report more carefully he could easily have seen that at the first reading the delegate from Great Britain recommended the angle of 5 degrees as it agreed best with the existing rule which said that side-lights should be made to cross 5 beams before the bow.

3299. At the very end of the discussion just before the question went to the vote when you had your last word the same statement occurs again. You say, "I would "like to point out that if this amendment proposed "by the learned delegate of Great Britain should be "adopted, it would simply mean that an observer "standing at about 10 lengths of the beam forward "of the ship in the line of the keel could see both of "the lights, and that he could see no light if he stood "on one side or the other. That is the proposition, as "I understand it, which is before us as an amend-"ment." Of course that means 10 half beams?—I think the stenographer in catching my words must have put it in that way; it is the only interpretation I can give. I suppose, too, that I cannot well have said that I would see *no* light if the observer stood on one side or the other of the crossing point. It evidently must read *only one light*.

3300. Then, actually, Sir Charles Hall must father this half point; it must be to Sir Charles Hall that the suggestion about this half point is due?—In that manner; that he mentioned the 5° angle before any other member of the Conference did.

3301. Has he fairly represented what was the English practice?—I felt and feel sure he did. Sir Charles Hall mentioned first the 5 beams' distance and the 5° angle, and I followed it up by proposing the half point angle, because I thought it would be more seaman-like to use these words, and that it would better agree with the existing rule of the Board of Trade.

3302. Now Sir Charles Hall's statement about 5° screening is based upon the Board of Trade's tables?—Yes, as far as I understand.

3303. Which gives certain distances at which lights should cross for ships of 20 feet beam and of 40 feet beam?—Yes.

3304. Have you examined these tables for yourself?—No.

3305. Then will you allow me to point out, that the figures in this table are not consistent with screening of the light 5 degrees but are only consistent with screening the light a quarter of a point from either light?—Sir Charles Hall told us that the regulations of the Board of Trade prescribed that the light should cross 5 beams before the bow: I do not know whether this statement is correct, but I am sure that what I infer from it is correct and that it would give half a point.

3306. If Sir Charles Hall were wrong that would to a certain extent have altered the tone of the discussion, would it not?—Yes, I believe so, because at that time we had nothing else to go by than the rule of the Board of Trade.

3307. Then am I to say that Sir Charles Hall was wrong?—I certainly cannot say that; I can only say what he told us. I have not seen the book. I think that he gave us some more figures, but I see him yet reading from the book, and then telling us that the lights ought to cross 5 beams before the bow according to the British rules. I beg you to understand that it was our wish to follow the safest road we could find, and that in order to do this we thought we could not do better than take up the regulations that were issued by the Board of Trade.

3308. (*Chairman.*) Before this discussion had you talked with Sir Charles Hall and considered with him what agreement or decision should be come to in Washington before this came on at the Conference?—I do not remember anything certain. I had been talking about the case of the screening of the American ship of war and about the Chilian ordinance to several delegates, but I certainly had not talked over with Sir Charles Hall the decision to which the German delegates had come. That I certainly had not done. More I cannot remember, as between that time and the present more than five years have elapsed.

3309. (*Mr. Bolam.*) But we may take it if Sir Charles Hall had suggested a quarter of a point of screening instead of half a point it is probable the Conference would have accepted that as being the British practice?—Certainly we wanted to be safe, and we wanted to adopt something that had been proved to be so in practice.

3310. You accepted Sir Charles Hall's statement about the Board of Trade practice?—Yes, certainly.

3311. In making these experiments that are made here, and of which I think you kindly published a diagram in the Nautical Magazine, you did not give any width of wick that you experimented upon, and therefore one is not quite sure how much of the whole breadth of the wick is being cut off at these various angles from 1° up to 2°·8?—The reason why I did not give it there was because these figures were not given in the official report, and as I thought such a question might be put to me here I have written to the lamp maker, and he has given me the diameter of the wick, and the diameter of the flame of the lantern. I will place it at your disposal as soon as I find it. I think I have got it with me here in London.

3312. Because it is necessary to know how much of the whole wick these angles show cut off?—Certainly; but, of course, what was cut off by the chock was not the wick but the flame.

3313. Then actually what is done in these experiments is this: you show the actual photometrical value of the reduced width of flame, and it shows nothing else?—Nothing else.

3314. Then taking into account the law of the inverse square of distances, you find out how far in distance from a ship the lights as compared with the full light would be really seen?—Assuming that the full light can be seen at a distance of two miles and no more.

3315. And the peculiarity of the experiments is that what the English surveyors call the "field of mingled rays" is a good deal narrower than what they lay down in their diagrams?—Yes, certainly.

3316. So that some of the calculations which have been made from the lamp with a 4° screening are not true?—Certainly.

3317. And we have now, for the first time, a photometrical value of the full light screening?—I believe so.

3318. So that we may take it the whole breadth of visibility of both lights is actually very much narrower than has been very generally assumed?—I am positive it is not above 1¼ cables in width anywhere.

3319. And the experiments lead to that conclusion and to no other?—To no other.

3320. When you have the electric light with the filament fore and aft you have none of the electric light cut off by the screening?—Yes, you would about do that; but you would not in that way get the full power of the light ahead. I want to say here that my experience of incandescent lights in ships' side-lights is not such that I can speak about them with authority. I have had experience, and experimented with incandescent lights in other places, but not in ships' side-lights.

3321. Then we might take it that if you have an incandescent lamp with a film perfectly fore and aft, and we have a 4° screening from the outside, practically the full value of the incandescent lights will be thrown across, but outside the area here?—Yes.

3322. That is to say, the incandescent lamp with the filament perfectly fore and aft and screened to 4° will show not only in these lights' width, but the extended width?—As far as I can see at present that would be the case if the filament never twisted or bent to one side or the other, but in that case you would not get the full power of the light right ahead of the ship where it is most needed, because the forward part of the filament would be in the way of the rays emanating from the rear one.

3323. We have evidence, however, as to one case, where the width is so small it may be neglected?—Exactly.

3324. And in that case we may take it the width of that field would not be reduced?—No; you will see on that diagram how it is.

3325. These electric lights are far more generally in use now?—Yes.

3326. And as time goes on they will be more generally introduced?—Yes, I suppose so.

3327. And we must make up our minds to that wider field?—If you do not make one rule for the ordinary lamp and another for the electric lamp, which easily can be done.

3328. In that case you would give an angle of less than 4° for the electric lights?—Yes, I would then try to assimilate the two, because I think it would be but right that the field which I have said exists in front of any vessel where both lights are visible, should be the same in every case as nearly as possible.

3329. In that case then the instructions to surveyors would not be a hard-and-fast rule to screen everything to 4°, but would be an elastic rule according to the nature of the light?—Yes, that is what ought to be done in such a case.

3330. But would a rule of this sort, the screening from the inner part of the source of light, one degree crossing the bow, do as a universal rule?—As far as I can see now that might be a very good rule.

3331. One degree from the inner side of the source of light is one degree crossing the bow?—Yes.

3332. So that the electric light would throw its light one degree, or perhaps a little more?—I would have to have a little more time given me before I gave a definite answer to that question; it seems to me a good rule, yet I would not like to bind myself without thinking.

3333. At any rate, you condemn a hard-and-fast rule to screen all lights 4° from the outside of the light?—If these rules should be made applicable to all sorts of lights, certainly; but I wish to state from what I have seen that the filament of the incandescent lights so far were not placed parallel to the line of keel, but that they formed a right angle with it, and, of course, in that case it would not make so much difference as in the case you have cited just now.

---

## Thursday, May 30th 1895.

PRESENT:

THE RIGHT HON. SIR FRANCIS H. JEUNE IN THE CHAIR.

Rear-Admiral ANDOE.
Mr. BOLAM.
Captain CASTLE.
Captain HUGHES HALLETT.
Mr. ISMAY.
Mr. SCRUTTON.
Captain THOMSON.

Mr. C. HIPWOOD, *Secretary.*

Captain THOMAS GEORGE KENDALL called and examined.

3334. I believe you are a master mariner, and that for many years you have been commander in the City of Dublin Steam Packet Company's mail steamers going to Ireland?—Yes.

3335. I think you are now in command of the steamship *Ireland*, are you not?—Yes.

3336. In the early part of 1893 you made some experiments, I think, with reference to the screening of side-lights?—Yes.

3337. The results of those experiments have been submitted to the Board of Trade in a letter from Mr. Watson of the 13th April 1893?—Yes.

*Capt. T. G. Kendall.*

30 May 1895.

3338. What did those observations in your judgment go to show?—Well, they went to show that it was very doubtful about the result of the screening of a side-light at what is called the 4° angle; that is to say, that if you screen a light at an angle of 4° from the outer edge of the wick to the outer edge of the screen, which is the Board of Trade regulation, it went to show that a light could be seen at a considerable distance across the bow beyond 4°.

3339. What result would these observations seem to show as to a 2° angle?—Well, it went to show, of course, that a 2° angle would not be seen so far across the bow as a 4° angle.

3340. In that sense a 2° angle according to these observations is probably to be preferred?—It seemed to me that a 2° angle would answer all the purposes required by the Board of Trade; at the same time I was not prepared to say that a 4° angle was not the correct angle, but it was not so from the results of my own observation; it did not appear to be so at that time.

3341. Since that time I think you have had many opportunities of observing the side-lights of steamers approaching end on?—Yes, I have.

3342. Now, assuming that all side-lights are now screened to 4° what is your present view as to that screening?—My present view is that a 4° angle is not a dangerous angle at sea. I have seen nothing to cause me the least apprehension about any danger on that account, that is at sea, of course. I cannot say anything about narrow waters.

3343. Now that represents some change of opinion since you made your observations in 1893?—Yes, it does.

3344. What is your explanation of such change?—Well the explanation is this, that it is quite evident that the full volume of light is not seen outside of 4° at a little distance; I mean to say if you go a mile and upwards I think what you may call the secondary light from the flame is lost; and if you remember the outer edge of the wick is screened to the outer edge of the screen you cannot get a full volume of light at 4° across the bow because you cannot see the flame. Really and truly the centre of the wick is only showing an angle of about 3°.

3345. So if I follow you right, although in theory the outside rays of an angle of 4° would be seen to cross at a certain distance, in practice that is not so because those outside rays get lost at a certain distance from the ship?—I think that is correct. I think they disappear. I do not think the lens of a ship's side-light is sufficiently powerful to throw the rays of light to a long distance.

3346. I may take it therefore that in your opinion the 4° angle is not a dangerous angle in practice?—I do not think it is a dangerous angle in practice at sea.

3347. At sea, that is confining it carefully?—I do not say that it is right; I still stick to my opinion that a 2° angle would answer the purpose.

3348. I wanted to supplement your last answer by asking you whether you think for practical purposes a 2° angle is sufficient?—I do. I think so.

3349. (*Mr. Ismay.*) Is that for both sea and narrow water purposes?—I cannot say about narrow waters. I have not sufficient experience to give an answer, but my impression is that a 2° angle would answer all purposes both for narrow waters and sea; but I would rather you got that from somebody else.

3350. (*Chairman.*) Your experience is not in narrow waters?—No.

3351. (*Mr. Ismay.*) Would you not call going into Holyhead narrow waters?—I have some small experience, of course, with the railway boats at Holyhead.

3352. In approaching each other?—I have seen no danger there in passing those ships, and watching them coming out; but still that experience cannot be compared to what you get from men navigating a river such as the Mersey.

3353. Or in the Thames and other tide ways?—Yes.

3354. (*Chairman.*) As I understand, your view is that there is no practical danger as regards open waters in having a 4° angle, but that a 2° angle is also practically safe?—Yes, that is my view of it.

3355. I do not know whether you formed any opinion as to the best point with regard to which to screen; the outer edge of the wick or the outer edge of the flame; or the inner edge of the wick or the inner edge of the flame, or the centre?—Well, I think if the outer edge of the wick is screened at a 2° angle (that is my idea of it) that would be sufficient to answer all purposes; then you would really have the light shewing about 1½°, the full volume crossing the bow.

3356. Hardly as much, I think?—Hardly as much, perhaps. It would be really flat against the screen; if you put a wick such as they have now of an inch and 1½ inches diameter flat up against the screen you have a 2° angle, showing it is impossible to make it show really right ahead; it must come across the bow somewhat.

3357. You attach great importance, do you not, to there being uniformity?—Yes, I think that is of very great importance.

3358. Before the last Board of Trade rule came into force, was there, in your judgment, a great variety in the screening of lights?—No, I never observed anything wrong about the screening of side lights or anything unusual. You can only go by the information the Board of Trade have collected about that, and it is quite certain, from the information which they have collected, that it was quite time to make lights uniform.

3359. Perhaps before 1893 your opinion was not particularly formed?—I do not think it was. It is a thing I never thought anything at all about.

3360. Do you think that was the case with the captains navigating steamers—that they did not pay any very particular attention to the exact screening of their vessels or other vessels' lights?—Yes; I think so. I have never heard of any particular notice being taken of the angle at which side lights should be screened.

3361. Before the Board of Trade rule came into force how were your lights screened?—They were screened to very nearly a 4° angle; they required very little alteration.

3362. Which way was the alteration; was the chock cut down or was the chock increased?—I think in my ship they took a little bit off one chock and put it on to the other; it was just as near as could be to the 4° angle—a little too much on one side and a little too little on the other.

3363. Do you know whether the steamers of your company were screened in much the same way?—Yes, I think they would be.

3364. I suppose they would be under the same superintendent, who would look after the whole of them?—Yes.

3365. I think you do not attach any great importance to the difficulty that has been pointed out by some persons with regard to a possible dark lane?—No, I think that exists rather in imagination than otherwise; I do not think it is possible to have a dark lane unless two ships are so close that the lights would not be of much use.

3366. Now, I see you have come to a practical conclusion on the matter, and that is, is it not, that the rule should be left as it was prior to the last Order in Council of January 1893?—Yes, that is my opinion.

3367. (*Rear-Admiral Andoe.*) Are you in command of one of the ships now?—Yes, I am in command of the "Ireland."

3368. The "Ireland," I understand, runs between Holyhead and Dublin?—And Kingstown.

3369. And you pass many steamers immediately in opposite direction to yours?—No, we do not.

3370. Therefore you have not been able, of your own observation, to make mental notes regarding side-lights with reference to ships passing immediately in opposite directions?—Well, yes, we pass two every night; we meet two every night; at least two.

3371. And almost immediately in the same line as yourself?—Very often they are, but not always so; but then, again, I have watched the lights of steamers as we passed ahead of them; steamers coming up and going down the channel; I have watched their side-lights. I have also seen the lights of the London and North-Western Railway Company's steamers, when they have been right astern of us, for a considerable time, and I have watched the side-lights, and the least alteration of helm would seem to shut out one light; it would require very little alteration of screening to shut them out.

3372. Absolutely to shut them out?—Yes; the ship as she worked in the sea from side to side would do so.

3373. At what distance would that be?—Various distances, one, two, three, and four miles.

3374. Absolutely cut off one light?—Yes.

3375. (*Mr. Ismay.*) Where are your lights placed on board the "Ireland"?—The top of the paddle boxes.

3376. And your mast head-light?—The mast head-light is at the fore-masthead.

3377. And your side-lights well abaft the mast-head-light?—They are about amidships.

3378. Well abaft?—Yes, well abaft.

3379. Did you ever go to the stem head of the "Ireland" to try whether you could see the lights?—Yes.

3380. Can you see them?—You can just see the outside of the lens.

3381. Do you not think if they are screened at such a broad angle, they are liable to be misleading to ships approaching?—I saw no light there that would be dangerous at the distance of a mile. Standing on the forecastle head the glare of the side lights can be plainly seen, and from the outside edge of the lenses. There is no light that strikes me of a dangerous character at all.

3382. Did you ever look before 1893 in that position to see your lights?—That I cannot remember.

3383. Of course, your attention had not been called to it?—No, but I should think it would be very much the same.

3384. Do you not think if they were to increase the brilliancy of the light and screen to finer angles that you would get the same satisfactory results?—With a very powerful light, yes; and with a smaller angle?

3385. Yes?—I think you would get more satisfactory reaults.

3386. You think you would get more?—Yes, I think so.

3387. Am I right in thinking you went to Washington?—Yes, I did. I was one of the delegates on that occasion.

3388. We had Captain Mensing before us yesterday, and I rather gather you did not go very thoroughly into the question before you agreed upon the half point?—With regard to the lights?

3389. Yes, you did not make any experiments then?—I think not; there was a Lights Committee.

3390. Were you upon it?—No.

3391. You meet a great many ships coming in and out of Liverpool?—Crossing?

3392. Yes?—Yes.

3393. They are all converging on your track, practically, between the Skerries and the Stack?—Yes, they nearly all pass the Stack.

3394. So that you have great opportunities of seeing lights?—Yes.

3395. In fact, too great?—Sometimes.

3396. (*Captain Thomson.*) How many years have you been in command of these steamers or similar steamers?—Am I bound to answer that question?

3397. Roughly will do for me?—33 years.

3398. It is a long time, evidently. Am I right in supposing that you have made daily voyages during that time in your steamers?—Well, not daily voyages; our practice is to run the night mail for a week. We cross twice every night during that week, and then we run the daily mails for a week, and cross twice each day, and then we have a week off; that is our practice.

3399. Every fortnight you make several voyages backwards and forwards?—Yes.

3400. In all weathers?—Yes, in all weathers.

3401. And you see passing steamers under all possible conditions pretty well?—Yes, we do.

3402. And you see no danger to navigation, or in any way, in the 4° angle of screening?—No, I have not seen anything to cause me to suppose there would be any danger.

3403. But you think at the same time that it would not lead to danger if the screening was a little finer?—That is my idea.

3404. When you made your experiments did you form any conclusion as to why you saw the light at a greater crossing angle than that due to the screening?—Well, the opinion I formed then was that what I saw was the light from the unscreened portion of the lens, and although the full volume of light in the lamp seemed to illuminate the whole lens the light I saw was outside the wick altogether.

3405. It was the light absorbed by the glass?—Yes, and we could see a good light about 6° across the bow.

3406. At what distance, roughly?—I can tell you, I have got it here. I have come armed with a great many papers. (*The witness referred to a diagram.*) It was 650 feet from the light where I made the observation. I could not very well get any further away, and that showed that the light would be full at an angle of 6°—there was a good light 6° across the bow.

3407. How was the light screened?—To the 4° angle.

3408. From the outer edge of the wick?—Yes, it was after the Board of Trade surveyor had surveyed the ship, and had screened the light to the proper angle.

3409. And then your light was visible to 6°?—Yes.

3410. That is an excess of 2°?—Yes.

3411. When you say the light was visible, do you mean the light disappeared?—No, it did not quite disappear then.

3412. It was still visible?—Further across there was what I take to be a good light.

3413. A fair light?—A fair light.

3414. You could have seen it further?—Yes, further than that across the bow.

3415. Were you experimenting with both lights or only one side light?—With both lights; with both the red and green light.

3416. Did you notice very much difference in the power of the two lights—the red and the green light?—No, I did not. I would not at that distance. I do not think I would be likely to do so. I think there is a great deal more in the colour of the lights than is generally supposed. I see many green lights in the Channel which are very much more brilliant than others; there is a vast amount of difference, and there is one particular shade of green, if we could only get it; it gives a splendid light, and there is a good colour as well.

3417. It is quite a question of the thickness and colour of the glass really. You do not think you can say as a rule that the green light is not so bright as the red, or the red light is brighter than the green?—I think not. I think if you get a good green light it is to be seen much further than the red light.

3418. Further than the red light?—Yes, I think so.

3419. Have you considered this question of screening from the point of view of the rule of the road?—Yes.

3420. Supposing you met a steamer at night time shewing both her side-lights to you, and the outer one of those lights was only 5° to starboard or port of your right ahead or the line of your keel projected ahead, what would you do then?—If I saw both her lights 5°?

3421. Both her lights; to be accurate only one of her lights can have a certain bearing, and I give you the outer one of her lights?—That would be her port light.

3422. It would be the port light in one case and her starboard in the other?—If I saw a vessel's three lights half a point on my starboard bow I should port my helm, of course.

3423. You would port your helm?—Yes, certainly.

3424. (*Mr. Thomas Scrutton.*) Half a point, where?—Anywhere, if I saw his three lights; it does not matter where it was.

3425. (*Captain Thomson.*) Did you say half a point?—Yes; it would not matter what the bearing was seeing the vessel's three lights. If I saw the steamer's all three lights right ahead I should naturally port, it would be coming straight towards me.

3426. Would you call a steamer's light 5° or half a point on the bow nearly right ahead?—I should hardly call 5° right ahead.

3427. Perhaps the compass card will help you?—No, thank you; it would depend upon the distance of the ship.

3428. At sea you cannot tell the distance of a ship that you see ahead, can you?—A man must be a queer sort of a seaman if he cannot judge the distance of a ship.

3429. It has been said that you cannot, but masters, I know, say they always can. When you see a light so nearly ahead as that, is it not the fact that the objects nearer to you on board your own ship are apt to come in the way, and that prevents you focussing your eye to an unknown distance. Is there not something in that?—There may be. I cannot remember finding any difficulty in judging the distance of a steamer that is approaching me.

3430. Supposing you see a steamer's three lights 5° on your starboard bow, distant about half a mile, what would you do?—Port my helm, most decidedly.

*Capt. T. G. Kendall.*

30 May 1895.

3431. You think you would be acting then according to the rule of the road?—Yes.

3432. And you would expect the other ship to port her helm also?—Yes, certainly.

3433. Now the question of screening comes in; you see, if your lights were screened so as to cover an angle of 5° at the distance of half a mile, the other vessel you are meeting would see both your lights as you have seen both hers, and you would both port?—The angle is not 5° but 4°.

3434. I am speaking of 5° which we know would cover that angle, there might be a degree out?—Yes.

3435. Now supposing the lights of both vessels were screened so as only to cover an angle of 2°, as you suggested just now, a finer angle of screening, then you might not see both the other vessel's side-lights, and in that case neither of you would port, although you would be exactly in the same position as you were before?—I presume what you mean is that the two ships are not actually approaching each other on this angle of 5° but are steering parallel courses in opposite directions; is that what you mean?

3436. No, I did not say so?—That is what you are driving at, I think—that is what you want to bring about, that they might port into one another.

3437. When you see the three lights of a steamer, you can in practice tell pretty well how she is coming to you, but the three lights only show that within the limits of their screening?—That is very true.

3438. So that if both your lights are screened to 5° it does not follow the ship is coming an opposite and parallel course. I took the case of a ship approaching you exactly end on, and you said you must port to her two lights?—Yes.

3439. Take that case again; if your lights are not screened 5° to cover that arc the ship approaching you end on, to which you have to port, would only see your green light?—End on. If the two ships were approaching end on, he must see my green light.

3440. But he would not see your red light?—If the two ships are approaching end on?

3441. They are not quite end on you see?—You mean that one ship sees all three lights and the other only sees one light of that ship.

3442. Precisely?—Well, I do not see how that matters; for instance, if I saw all three lights of a steamer approaching half a point on my starboard bow, he would be coming direct towards me, and he probably would only see my starboard bow light; is that what you mean?

3443. Yes?—I should let him see my other light—I should port my helm.

3444. Now, I want to ask your opinion about that matter. In the one case he would port his helm to you according to the rule of the road because he would see both side lights, and in the other case he is not bound to port, only seeing one light, and he might starboard, and that would be very awkward?—Yes; you see he would know perfectly well I should see all his three lights if I was end on to him—he would know that I must see his three lights; and, therefore, as far as I am concerned I am bound to port and show my red light.

3445. The reason you ported to that vessel was because you considered him a vessel approaching you nearly end on, a vessel whose three lights you could see—but you did not consider at the time you gave that answer that he could not see your three lights?—I might suppose—I would suppose—he probably would only see one of my lights.

3446. And yet you would port to him?—Yes, I think so.

3447. That would be your duty to do so?—Yes.

3448. Even although you supposed he would only see your one green light?—Yes.

3449. (*Captain Hallett.*) In the similar case of a vessel 6 points on your starboard bow if the lights were only screened to 2° and carefully screened to 2°, would it not be a greater safeguard that he could not then see your lights and you could not see his two lights—do you see what I mean? Before you could see his two lights he would only be about 2° on your bow. Perhaps you do not follow me. It is put to you this way; a vessel is 5° on your starboard bow and you see his three lights while he only sees two of yours?—Yes.

3450. Very well, you only have to bring them so that he will see both your lights when you come four points?—4°.

3451. Very well; then that would only give you a complete angle of 2° on either side of your bows as a danger angle?—Yes.

3452. Now if you have 4° as they have at present, you cannot tell within 8° how he is going, can you?—Well, you are supposing something I do not quite understand.

3453. I am looking at it in this way; at 4° you cannot be certain of how that vessel is coming; he may be coming dead on you—he may be crossing your bow 4°, or he may be going 4° away from that line?—I see what you mean.

3454. Do you not consider if the screen was cut to 2° it would be a safeguard by reducing that angle by one half?—Certainly, that is quite my idea.

3455. That is one of the reasons why you want it reduced to 2°?—Yes; at the same time I think there is more imagination than anything else about the light being seen 4° across the bow, at a distance of a mile and upwards. I do not think myself that you would be misunderstood by the 4° angle, as far as I can make out, at sea; at the same time, I think the other would be better.

3456. In a vessel like that, 5° on your starboard bow, and with a light screened to 4°, you would only have to alter your course one degree to show him your three lights, would not that be so?—Yes, I think that would be so.

3457. So that he would have all your lights in sight directly you touched your helm?—Yes.

3458. And there would be no doubt about what he did then?—Yes.

3459. (*Captain Castle.*) Going back to the three lights in your starboard bow; she is right ahead or nearly right ahead; on your view of it, it is your duty to get out of the way and port and go to starboard?—Yes.

3460. Now take the other view and say she is not right ahead but she is on your starboard side, it is still your duty to get out of her way?—Yes.

3461. If you get too close to her you stop?—It all depends on the distance.

3462. And the act of porting shows the other ship your red light?—Yes.

3463. And tells her to do the same thing—to port also?—Yes, for ships approaching end on, or nearly end on.

3464. Each ship goes to starboard?—Yes—it is a question how you define "nearly end on." It has been ruled that two points on the bow are end on.

3465. If she is not end on she is on your starboard side it is still your duty to get out of the way?—It is still my duty to get out of the way and I should naturally port.

3466. And the majority of the ships you pass in your trip across to Holyhead from Dublin—you are going at right angles to them?—Very nearly.

3467. So that the screening does not affect you much, but beside meeting your own vessels every night, you meet many other vessels?—Yes.

3468. And then if you see a green light a little on your starboard bow, what do you do if she is approaching you and you see a green light?—We should stand on: we should not make any alteration unless he did.

3469. But if you thought you were going too close?—Well then the probability is I should starboard in time to give him more room before we got too close.

3470. The other ship would probably do the same thing?—Yes.

3471. (*Mr. Bolam.*) You said you would like to leave the Board of Trade rules as regards the screening the lights the same as it was before 1893?—Yes.

3472. What do you consider the Board of Trade rule was before 1893?—That ships' lights should be screened to show from right ahead to two points abaft the beam.

3473. That is the International regulation; but the Board of Trade have to issue instructions to their surveyors in regard to screening for the purpose of practically carrying out these regulations?—What I mean is, the International regulation should be left as it was, and leave the Board of Trade free to screen the lights in a particular way; but this Order in Council has bound them down to a 4° angle.

3474. You would not bind the Board of Trade to a 4° angle if you had your way?—No.

3475. You said that in the case of very excellent lights a finer angle of screening would be very desirable?—Yes.

3476. Even though you left 4° for poorer lights?—I do not think you could have a different angle for different lights?

3477. Have you seen electric lights in steamers very much?—No, not much.

3478. You have not electric lights yourself?—No.

3479. If you have an electric light which could be placed in a lamp it has a very small width right ahead, if you screen that 4°, you practically have all the light 4° across your bow?—You do not get that light weak.

3480. So that 4° would not be a good angle in some cases?—No, I think not.

3481. You think it would be desirable to reduce the angle for that type of light?—Yes.

3482. When you see vessels coming astern of you you have noticed they were showing their red and green lights alternately?—I have noticed that they were cutting off their side-lights very sharp.

3483. Was that owing to their yawing?—Yes.

3484. Were they screened to 4°?—I assume so.

3485. Vessels yaw so that with 4° screening they shut out one light or other alternately?—Yes.

3486. The point made of the 4° is that it would diminish that uncertainty as to what another vessel is doing when she is yawing. You may have the impression that the other vessel has altered her helm when she has not. You have not found that that is the case?—No, that is not what I would say. I would say the very least yawing or the least deviation from the straight line shuts out the light at 4°.

3487. You have been asked a good deal about a light at 5°, or half a point on your bow, and you have been asked to suppose you could see the other vessel's three lights there?—Yes.

3488. That is just a dividing case between a vessel crossing and a vessel passing you?—Yes.

3489. And all difficult cases of that sort could not be eliminated and got rid of, no matter what angle you screened to?—I do not think so.

3490. And all these matters must be dealt with by the intelligence of the officer in charge of the vessel?—Yes; you must give him credit for some little common sense, you know.

3491. (*Mr. Scrutton.*) Is yours an electric light?—No, rock oil.

3492. How far do you consider you see these lights on an ordinarily fair clear night; I do not want an exception either way?—I suppose two or three miles, they are supposed to be visible two miles.

3493. I wanted to know how long, as you said you could judge distances?—We very often see side-lights—I have seen them—four and five miles off.

3494. Without there being any exceptional circumstances?—In exceptionally fine weather.

Captain ANTHONY S. THOMSON called and examined.

*Capt. A. S. Thomson.*

3495. (*Chairman.*) I believe you have made some experiments with side lights?—Yes.

3496. With what object did you make those experiments?—To inform myself to what extent the use of electricity as an illuminant for side lights affects the question of screening; also to ascertain practically up to what angle of crossing the extreme outer rays are visible at a moderately short distance with different illuminants.

3497. Why did you consider it advisable to experiment with electric lights?—Because many merchant vessels and men-of-war use the electric light in their side lights, and I considered that this practice would become more general in future.

3498. Why did you attach importance to the crossing angle of the outer rays at moderately short distances?—In reply allow me to refer to the table* in Sir Digby Murray's evidence showing the distance apart at which meeting ships would pass after sighting both each other's side-lights at a quarter and a half mile distance at an angle of 4°. It struck me that these conditions might possibly be present with an angle of screening less than 4°, and I wished to ascertain practically what angle of screening would satisfy the conditions. With electric lamps in a good lantern I find the conditions given in this table are fulfilled with an angle of screening of 0° from the inside, or of 1° from the outside of the filament. Besides, I consider moderately short distances in the case of ships meeting to be the critical ones, when the officer of the watch has no time to note the change of bearing of the light he sees, and has to act immediately in accordance with the Regulations for Preventing Collisions at Sea, though he may only see a glimmer of the second light.

3499. Do you produce any results which appear to you to prove this?—Yes, I hand in a list† of some of the experiments which show this clearly.

3500. At what distances have you experimented?—572 yards.

3501. Why that precise distance?—Because it is the distance from the building in the works of the Silvertown Telegraph Company where the lights are exhibited to the dockyard wall on the opposite side of the river.

3502. How was this distance measured?—By triangulation.

3503. What lanterns have you used?—Three kinds: "Harvie" full sized dioptric, a pair of fish globe lanterns (maker's name unknown), and a third pair smaller and cheaper with dioptric lenses.

3504. How were the lanterns placed during the experiments?—The screens were first placed on a carefully levelled table, and after being pointed in the required direction, secured to the framework. The lanterns were then placed in position and cleated with their inner sides parallel to the screen. The screens were parallel to each other about four feet apart.

3505. How were the lamps sighted and screened to the required angles?—Two white marks corresponding to the projected lines of the screens were set up on the opposite side of the river, allowance being made for the half width of the lanterns. These marks were called the "reference marks," and the lines from the centre of the lanterns to these marks, the "reference lines." On either side of the reference marks, other marks were made indicating the extremities of the tangents for 1, 2, 3, and 4 degrees. Each lantern was sighted independently on its reference mark by means of two plummet threads, one of which passed down through the funnel of the lantern, and the other suspended a short distance beyond the end of the screen, its bob being immersed in oil. The inner plummet remained in one position over the centre of the lantern whilst the other one was moved as required for sighting. A thin metal slide with vertical outer edge, working through the screen at right angles, was moved in or out, so as to bring its edge exactly in a line with the two threads. When this was done the position of the slide was read off on a fixed millimetre scale by means of a small pointer on the slide. The number of millimetres so obtained was called the reference number, and by adding or subtracting a number of millimetres corresponding to the width of the wick or filament, and the length of the tangent at the slide, the screening could be rapidly changed to any required angle from inside, outside, or centre of the source of light.

3506. What illuminants were used?—The details of the illuminants, filaments, and wicks used, are stated on the first page of the list of experiments handed in. They include electric lamps of 32, 16, and 8 candle power, and I may say of 50 candle power and 100 candle power, also colza, and mineral oil burners and wicks.

3507. Can you give a general statement of the results you obtained?—As yet I can only say that with 32 candle-power electric lamp in Harvie lanterns the extreme outer rays at 575 yards are visible to 3½ degrees beyond the angle of screening from the outer edge of the filament with both colours, that this crossing angle decreases with diminished power of light being 2° with colza and 8 candle power electric light, and somewhat less than 2° with an ordinary fish globe lamp burning mineral oil. Also that the green light, though apparently much less intense than the red with equal power is more persistent than the red and is seen to as great a crossing angle. I may add that since that was written I have made other experiments, and I have found that with very powerful lights such as 100 candle-power this crossing angle at this distance goes up to 5°.

3508. How do you account for this crossing of the light?—I believe it is simply due to the luminosity of the

* *See* Appendix 2. No. 4.
† *See* Appendix 10.

*Capt. A. S. Thompson.*
30 May 1895.

lens, the excess crossing angle being equal to the angle subtended at the chock by the arc of the lens which is sufficiently bright to be visible at the given distance.

3509. You are of opinion, are you not, that at long distances this excess light will altogether disappear?—That follows, if my explanation of the cause is the correct one.

3510. Have you any practical suggestion to make from the experience you have obtained?—Yes, I find that when it is a question of comparing the crossing angles of the red and green, it is best to experiment with one lantern only, changing only the coloured screen. This forms, I believe, the best practical test of the relative power of the two coloured lights at a given distance.

3511. I think there is another matter of a rather different kind. I think you ascertained the exact angles of screening of vessels belonging to your company which had not been altered for a considerable time?—Yes.

3512. I think you have drawn out a table in reference to the "Silvertown," which has not been altered since 1889; the "Buccaneer," which has not been altered since she was built in 1885; and the "International," which has been laid up for several years, since 1887 or since about 1887?—Yes.

3513. And thus you see what was the actual angle of screening adopted in each of those vessels at those times?—I should like to correct one of those dates. The "Silvertown" screening was written from memory, and I have not been able to verify the date quite positively. I was not able to say which voyage I did it on, although it was before 1890. I am not sure which voyage I did it.

3514. However, it was before the new rules?—Yes, none of these screens have since been surveyed by the Board of Trade surveyor; they have not been altered in any way.

3515. (*Rear-Admiral Andoe.*) Not inspected?—As a matter of fact they have not been inspected.

3516. (*Chairman.*) I may say that the highest goes up to 5° 20′, and the lowest is 2° 41′—they vary between these?—I should like to say that in the case of the "Silvertown" I screened the lights myself according to what I considered the International Regulations required—that is parallel with the keel from the inside of the lens, without taking the position of the wick into account. It is curious that they should come out just 4°. I believe it has been the custom at sea generally to do that.

3517. Screening from the inside of the lens gives you 4° to the outside of the wick?—With a good lantern it does—it used to do so, but I may mention that the "Silvetown's" screens were longer than 3 feet.

3518. (*Rear-Admiral Andoe.*) Because you get the rays from the lens as well?—Yes.

3519. The wick does not give 4° but the light crosses at 4° notwithstanding that it is parallel with the keel?—That is another matter, I am now merely speaking of the screening.

3520. (*Mr. Bolam.*) The general outcome of your experiments was that an electric light will throw far more light across the other bow, that is, more is due to the angle of screening of the filament?—At moderate distance.

3521. And these distances you call moderate, are still outside what we might call the collision range?—Yes.

3522. And that would point to the observation that screening the electric light should be finer than lights of a weaker kind?—If the screening at short or moderate distances is supposed to be important.

3523. (*Captain Castle.*) What do you call the collision range?—Well I think myself that ships in narrow waters where no doubt the finer screening—where there is most occasion for finer screening—I should think that collision range might be as little as 200 yards?

3524. At sea?—At sea, I should say a quarter of a mile.

3525. (*Mr. Bolam.*) What is the distance at which you experimented for these excessively large angles—is it over and above that distanoe?—More than that—600 yards.

## Wednesday, 19th June 1895.

PRESENT:

THE RIGHT HON. SIR FRANCIS H. JEUNE IN THE CHAIR.

Rear-Admiral ANDOE.
Captain WILSON BARKER.
Mr. BOLAM.
Captain CASTLE.
Sir EDWARD HARLAND.
Captain HALLETT.
Mr. ISMAY.
Mr. SCRUTTON.

Mr. C. HIPWOOD, *Secretary.*

Mr. WILLIAM HARVIE called and examined.

*Mr. W. Harvie.*
19 June 1895.

3526. (*Chairman.*) I think you are a manufacturer of ships' lamps, and carry on business at 222 Broomielaw, Glasgow?—Yes.

3527. In your view, the essential requirement in ships' side lights is visibility, is it not?—Yes.

3528. The greater difficulty as regards that point has been felt, has it not, in connexion with the green light?—Yes, I have a report here of evidence given over 20 years ago by Mr. Gray when he was getting up the trials that took place at Shoeburyness at the time. It is a preliminary report, and this is the statement he made out previous to the trials.*

3529. I see what Mr. Gray says is that "there is not "much difficulty with the colourless masthead light; "and as regards the red side lights, experiments "recently made over measured ranges at Shoebury- "ness lead to the conclusion that a roomy lanthorn of "the usual pattern, when fitted with a proper burner "or burners, and with reflectors and plano-convex or "dioptric lenses, will, on a dark night, with a clear "atmosphere, throw a light for a distance of two miles. "The green light presents the greatest difficulty, and "it appears that no ship's lanthorn yet tried at Shoe- "buryness has been found capable of throwing a green "side light two miles over an arc of ten points of the "compass. An efficient lanthorn for the starboard "side lights has, therefore, yet to be submitted"?—Yes, that refers to the trials that had taken place before that date—trials that took place in previous times.

3530. I understand that since the introduction of light towers about 20 years ago you have personally fitted a large number of lights and screens on board many vessels, both at home and abroad?—Yes, that is so.

3531. And have you fitted them upon some of the largest steamers afloat?—Yes.

3532. Were they fitted in accordance with the Regulations and Orders in Council in force at the time?—Yes.

3533. Of course we know that before the present 4° rule there was an earlier regulation which laid down the screening in a different way?—Yes, that is so. This is the old regulation. It pointed out that

* Notice to Lamp and Lanthorn Makers, printed on p. 5 of H.C. 184, of 1873.

the light was to be visible for two miles from right ahead to two points abaft the beam.

3534. Your lamps were fitted with a view to their complying with the regulations?—Exactly.

3535. In complying with those previous regulations it was necessary to have the flame of the burner so placed as to show a full power ahead?—Exactly.

3536. What angle over the bow would be necessary in order to obtain that full power ahead?—I calculate, as nearly as possible about 2°, but there was a drawing I sent to the Board of Trade while that matter of the crossing the bow was under discussion. They asked me to show them in what manner I was in the habit of fitting the screens, and they said (I think it was Sir Digby Murray made the remark) that what I had shown gave 2½°, but I could not say exactly, because I have lost that drawing and I cannot refer to it. But it certainly did not exceed 2½°. I think it is rather 2°.

3537-8. And your view about this 2°, or whatever the exact measurement may be, is that that is ample for safe navigation?—I think so.

3539. When you say 2°, do you mean 2° from the outer edge of the wick?—Well, it shows an angle to the keel of the ship of 2°.

3540. But does that mean that the whole of the light makes the angle?—I think it refers only to the outer edge of the wick where that angle is measured from. We were not formerly in the habit of measuring the outer edge of the wick in any way, we always worked from the focus; it is a new idea altogether this measuring from the outer edge of the wick.

3541. I believe you have made yourself acquainted, have you not, with the report and recommendations made by Sir Murray Digby and Mr. Samson in 1891?—Yes.

3542. In your view the experiments upon which that report was based were not very complete?—No, they were not sufficient.

3543. You think that the power of the lights used in those experiments should have been stated?—Yes.

3544. And that the trials should have been with other lights and of a more general kind?—Yes, they should be repeated by other sets of observers. I may mention the navy. I have had a considerable connexion with them in supplying their lights for the last 10 years and over; they have the most elaborate reports, and are not satisfied with one set of observers, but they will hand the same thing over to two or three different persons, and after that they are put through a test at sea; they do not from a mere glance or look at the light condemn everything else and begin anew; they have a lot of different reports to make sure of the ground they are going upon.

3545. Could you tell us how the information is obtained which is contained in these reports?—I presume if you applied to the navy they would furnish you with those reports.

3546. Who makes the experiments for the purpose of determining upon the matter?—Well, the principal part of the experiments have been for the last, I should suppose, five years made under the captain of the steam reserve at Chatham; previous to that there were experiments in Portsmouth, as far back as 1879. Admiral Carpenter was chairman of the committee, and there have been others besides since that time. I do not know all the different experiments that were made, but I know there were a great many. I hold here a programme dated December 1885; I was invited to go down to see the experiments at Portsmouth; but this is only one of a great number that took place.

3547. I observe this is dated the 19th of October 1885, and it is a programme of comparative tests to be made with bow lights fitted to burn oil and others fitted to take electric lights?—Yes. There are so very many varying conditions that it is quite impossible to arrive at a decided realut from one experiment—the thing ought to be repeated over and over again. There is the trim of the lamp, and the state of the atmosphere, and a great many other things which have to be considered.

3548. You think the experiments upon which the 2° was arrived at were not sufficient to justify an alteration of this kind?—They were certainly not; there is not a vestige of argument to show that the alteration was necessary.

3549. (*Captain Hallett.*) Does the witness refer to change from more degrees than 4° to 4°, or from less degrees than 4° to 4°?—I refer to the change from the original regulations.

3550. (*Chairman.*) From the original regulations to the new regulations?—Yes, there were no 4° previously to that.

3551. Practically, what did you regard as the meaning of those old regulations—what screening did they practically give?—That is what I have stated here; you have to produce a light to show two miles ahead from right ahead to two points abaft the beam; my attention was directed to carrying that out, and we did carry it out.

3552. That is what I understood you told me just now, and that it meant about 2° or perhaps somewhat more?—Quite so.

3553. So that you had regarded an angle of about 2° as screening which was in accordance with the regulations then in force?—Yes. When the rule first came out it did not strike me at the time that it was to create such an amount of trouble and difficulty. I thought that it merely referred to a little alteration upon the chock of the screen-board—a little taken off; but instead of that they have mixed it up and caused the wick to be placed in a particular position and caused us to alter the lamps that have gone on for years without anything being the matter with them.

3554. That is the next point I wish particularly to call your attention to, apart from the 4°. As I understand you the present regulations refer to the placing of the wick at some particular angle to the keel?—Yes.

3555. What is the exact regulation about that; do you happen to have it by you?—I have it. The wick is to be at right angles to the keel. I have frequently, when the surveyors were in my place, pointed out that the edge of the wick is not a proper place to measure from, because the flame projects beyond that about a quarter of an inch. Now, if it is to be taken in that way, by the side of the wick, they are giving you 4½° and not 4°. I have a little model here by which I can illustrate it and show that with this extra width of flame, there are slight diffractions which also take place; it may increase it a little bit, this extra flame increases ½° or thereabouts.

3556. When you spoke just now of 2° or 2½°, did you mean 2½° or 2° from the outside edge of the wick, or did you mean 2½° or 2° from the outside edge of the flame? What screening had you regarded as complying with the previous regulations?—These angles refer to the line of the ship, and it does not matter if it is 2° or 2½° which point of the wick you measure from, the main thing is that the angle with the line of the keel is 2½°.

3557. I wanted to know what your view was as to the kind of screening that would satisfy the old regulation, that is to say the regulation which preceded this 4° rule?—The smaller one in this plan would give a greater angle than we were in the habit of giving; the line of the larger wick would be the plan upon which we have formerly fitted our lamps.

3558. What angle does that give, screening from the outside of the wick?—Well, the reply I got from the Board of Trade was that the angle that my drawing showed was 2½° from the outside of the wick. I have a drawing here (*produced*). *This* is the edge *here*, and *here* you see the light falling on the lens and passing through it; the whole flame comes to *this*; this angle over the bow they said was 2½°. I was under the impression that it was rather less.

3559. I rather gather that the effect of that was to screen practically the inside edge of the wick. Do you represent that was what it meant; that it would be screened by the inner edge of the lens cutting the inner edge of the wick?—Yes.

3560. And the chock in the same way?—Yes.

3561. So that would be equivalent to what we call screening to the inner edge of the wick?—Yes.

3562. (*Mr. Ismay.*) In other words, parallel with the keel?—Yes, in other words you must not intercept any of the light from the lens, otherwise you reduce the power of the lamp.

3563. (*Chairman.*) Do you make any allowance for the inside of the flame, because we have spoken here of the inner edge of the wick. If you speak of the flame

*Mr. W. Harvie.*

19 June 1895.

you must allow something beyond it, because screening to the inner edge of the wick is not quite the same thing as screening to the inner edge of the flame?—No, hardly; that was an extra long wick, an inch and three-quarters.

3564. (*Mr. Ismay.*) Would Mr. Harvie tell us what was the position of the wick there; what angle?—This wick here was at the same angle; the Board of Trade will not allow us to alter it, and these burners are fixed rigid with the apparatus for winding the wicks, but we have sometimes to vary them in certain positions according to the fittings of the ship; we have to make the doors on *this* side, and the lamp instead of going in *here* goes into *there*. I had some difficulty in a recent case of a Dublin steamer built in Port Glasgow; the surveyors objected to pass the light put in that way, because it was a little different; but I saw Mr. Herriot, and I made it right so as not to have any further trouble.

3565. (*Chairman.*) Let me be quite sure that I have got it clear that before the new regulations you would have considered a lamp to be screened satisfactorily which had the inner edge of the lens, the outer edge of the chock, and the inner edge of the wick in a line?—Exactly, the whole width of the flame was outside and that made the angle over the bow.

3566. (*Mr. Bolam.*) And nothing else but the breadth of the wick?—Nothing else. I may mention that in consequence of this alteration to 4°, I have increased the length of the lens.

3567. (*Rear-Admiral Andoe.*) There would be no objection, you consider, to the inner edge of the wick, the inner edge of the lens, and the outer edge of the chock being in a line; that would be satisfactory screening?—Yes.

3568. There would be no objection to that lens, if necessary, being brought round as far as *here*?—Oh, no.

3569. Therefore, you would have the inner edge of the wick and the outer edge of the chock passing through the lens, and that would not affect the light?—It would not. When we required this extra 4° we made a longer lens, and we are making them all the same way now.

3570. (*Sir E. Harland.*) In other words, you are obliged to make your lens so much longer in order to embrace the 4°?—Yes, a little longer.

3571. That is more than a third of a circle?—Yes, 116½° plus the fittings.

3572. (*Chairman.*) You told us that the present rule really requires more than 4°, because you have to allow for the extra width of the flame?—Yes, that is exactly what I can show by the model that I have here. The lamp is half size, and the screen is 18 inches long, and, measuring from the outer edge of the wick to the outer edge of the screen, the space is 1¼ inches. The first line upon the screen shown represents the 4° angle; the second line, with the sliding bar extended nine inches, marks the point where the ray should stop for the 4° angle, but owing to the extra width of flame the ray reaches the third line, being over half a degree more. This can be demonstrated with the lamp alight in a dark room.

3573. What causes the extra amount?—The extra width of the flame. This extra width of the flame causes the ray to come to the third line on the model.

3574-6. (*Mr. Ismay.*) The middle one?—No, from the second to the third line. The flame spreads out, and you cannot prevent it spreading.

3577. (*Chairman.*) I think in your view this alteration from 2° or 2½°—whatever it was—to the 4° was unnecessary?—I think it was quite unnecessary, and more especially since it is coupled with this arrangement of placing the wick.

3578. Would you kindly explain that to the Committee? As I understand, you think that placing the wick at a particular angle is unnecessary?—Here is a diagram which I have made to show this. This, for instance, represents the test of this light—the small one. When the wick is placed at right angles to the keel the figures of the measurements are given in black. When we change it and place the wick parallel to the keel the figures are given in red; you will see there is so very little difference that it is hardly worth while to bother about it, and take all this trouble.

3579. (*Rear-Admiral Andoe.*) What do the figures represent?—We have a photometer bar, with a standard lamp at the one end, and we light the lamp which is being tested at the other; and these figures represent the distance from the lens to the photometer.

3580. (*Mr. Bolam.*) In inches?—Yes.

3581. They give the photometric distance in inches?—Yes.

3582. (*Rear-Admiral Andoe.*) That is, whether the wick is set at right angles or end on it is practically the same?—It is practically the same. The difference in power is shown there. If you take the point where the light is strongest the figures are 46 in one case and 45 in the other. The difference is not great.

3583. As regards volume?—As regards power.

3584. As regards penetrating power?—Yes.

3585. And as regards volume?—It has nothing to do with it. It is the power given on the photometric disc.

3586. (*Mr. Bolam.*) That is to say, the larger numbers there represent the stronger value of the light?—Yes.

3587. With these is there some more light *here* at 46 than *here* at 42?—Yes. You see it may be explained to a certain extent why some of the difference exists by the fact that the reflector in certain positions has greater power. Here is another drawing of a full-size lamp with a duplex burner. In this case also the two sets of figures, the black and the red, are pretty uniform; but in the centre, where the reflector has more power, the light seems to be a little stronger, and the figures are 72, 73, and 74.

3588. (*Chairman.*) That is just about, I suppose, the focus of the reflector?—The focus has more power.

3589. (*Captain Hallett.*) What does 46 and 47 represent?—Inches.

3590. Have you used a standard candle?—No, a standard lamp.

3591. What lamp have you used?—Just an ordinary paraffin lamp; the lamps are just the same as we burn in these. The lamp, perhaps, gives 10 or 12 candles. It would not have been a very good experiment only to have had one candle power.

3592. You would have had too great a distance?—Yes, of course it would have been a simple matter for me to test the lamp in that way, and then give it with candle-power.

3593. You got a lamp as nearly as possible the power of these lamps?—Yes; then I measured with the wick parallel to the keel, and again with the wick at right angles to the keel. You will see from the drawing that the single wick does not give quite such good results as the double wick, but it is sufficient for all practical purposes.

3594. (*Chairman.*) So that you do not regard this order to put the light at a particular angle as a necessary order?—I think it is a very nonsensical order.

3595. (*Rear-Admiral Andoe.*) What is the best place to put it in?—If you are going to make any measurement I would make it from the focus.

3596. (*Chairman.*) Supposing you wanted to draw up regulations for the screening of ship's lights, from what point would you take the screening; from the outer edge of the wick, the outer edge of the flame, the centre of the wick, or the inner edge of the flame?—I think I would measure it from the focus.

3597. The centre of the wick?—Yes, I think so.

3598. Of course, screening from the inside of the wick has the addition of simplicity?—Yes, no doubt it has. We were always accustomed to have the screen boards alongside the lens, similar to what I have there.

3599. That was a very simple mode of doing it. Everybody understands screening to the inner edge of the wick?—Yes.

3600. It is a simpler way than calculating the number of degrees?—Yes, quite so; and if a very narrow wick was placed in the lamp, it would require to be put further into the lantern so as to get the proper number of degrees.

3601. There is something here about a special case. I do not know if you desire to mention that?—That is a case which has occurred since these measurements began to be taken from the outer edge of the wick. They do the same with a filament in an electric lamp, and the result is they do not get a proper width with, say, a 32-candle lamp, and they go to a 50-candle lamp for the purpose of having it wider. And in the case of a ship we were fitting out in Dundee the men had to

take out the 32-candle lamps and put in 50. That was done without any intimation to myself. I did not know about it at all. I consider they had no right to do anything of the sort. If I had known before, I would not have made that alteration for them, because they first cause a very dark green glass to be used and then they insist upon this larger flame.

3602. You were speaking of screening the electric lights. Have you made lamps for the purpose of receiving electric lights?—Yes, we supply them regularly.

3603. From what point do they screen the electric light, from the outside of the filament?—Well, it appears to be so. I was not aware of it until this case cropped up about the rejection in Dundee. But I presume they were screened in the same way as the oil lights, because in the event of the failure of the electric lights the oil lamps must be put in their place.

3604. How should you apply the rule of screening to the inner edge or the middle of the wick, with regard to the electric light?—I would do it in the same way. I would take either the edge or the centre, whichever it might be.

3605. That, you think, would produce satisfactory results?—Yes, I do.

3606. Do you think screening to the inner edge of the filament of the electric light would produce substantially the same sort of result as screening to the inner edge of a wick?—Yes; but the Committee should first state the distance at which they wish the three lights to be seen by an observer on another vessel, so that one eye can see the whole three at once. Then, after that was arrived at, it would be a simple matter to apply the screening in the smaller incandescent lamps; the width of the filament might not be sufficient because it is narrower than in some of the oil wicks. In that case, if you were to simply take the inner edge you would have a slightly different angle than what you would have if it was a broad-wicked lamp, so that in that case to take your angle from the focus would be the most scientific and correct way—that is my idea.

3607. And you think that a rule which required the angle to be taken from the centre would be equally applicable to the electric light and to the oil lamp?—Oh yes, no doubt it would apply.

3608. Would it be possible, do you think, to lay down a rule which would be equally applicable to electric lights and to oil lamps both?—I think so.

3609. If, for example, you were to say that the angle should be so many degrees calculated from the centre either of the wick or of the filament, would it in your judgment be a rule which would cover both cases?—I think so.

3610. I think that you wish to draw attention to the appearance of the diagram No. 3 in the Report?—Yes.

3611. Will you be kind enough to give us your view about that?—That is more a matter of fixture and fitting the sidelights and screens, and I maintain that that should have no place in official documents; it is not an article which has been, what you may term, tested at sea to any great extent.

3612. That is a diagram, as I understand it, which shows the sidelights hung so as to swing?—Yes, they are on screens which are placed on gimbals. I have fitted lights with them many years ago, but it is not a plan which is generally applicable. I do not want to find fault with the man who has introduced this plan of screening, but I object to it being placed so prominently in official documents; it ought first to have undergone some kind of test. I referred a little while ago to the practice in the navy. After all these reports have been obtained from the different parties reporting to the Admiralty, then the lights are sent out for sea trials for 12 months, and not to one ship only, but to various ships, before they decide upon a new plan; but here the thing is adopted without anything of that sort.

3613. In your opinion there is not sufficient experience to justify that as an official order?—Certainly not.

3614. What is this 40° requirement?—This refers to the vertical divergent rays. The lens is for the purpose of intercepting the divergent rays which go up to the sky and down into the water, and it projects these rays in a horizontal direction. It is necessary for the safety of navigation, on account of the movements of the vessel, that these rays should be sent forward with a divergence of 10° upwards and 10° downwards or thereabout. It was found by experiments in the navy that an oil lamp is not suitable for a permanent list of 20°, as the oil either runs out of the lamp or drowns out the flame, but I do not think the whole of the lamps should be injured for the sake of an odd case such as I have mentioned. I think it is very rarely that a vessel has a permanent list of 20°, and to give 20° divergence the power of the lights is reduced.

3615. (*Rear-Admiral Andoe.*) Do you supply the lights principally for the navy?—Yes, I have done so for many years.

3616. Are they the best lamps that you produce?—The lamps that I supply to the navy?

3617. Yes?—They are not the largest size. They are as good as we can make. I believe I have some photos here. In fact the lamps I supply to the navy would not be passed by the surveyors, but the Admiralty hall-marked the sizes of my lamps, and they adopted the second size, as they considered it sufficient in power for their requirements.

3618. But they are, as a matter of fact, not as powerful as some lights carried by some of the merchant ships?—Oh, no, the principal objection that they had to them was the room they took up. I was cramped in my original pattern to make them suit the places they had previously used—the recesses.

3619. Are they all passed before they are accepted in the navy?—They undergo a thorough examination.

3620. Are they sometimes rejected?—If there is any defect they are. They are tested in this way. After having the photometric test and the other examinations, then they are trimmed and put through what is called the endurance test, and the wick is turned up, I forget for how many hours, perhaps five or six hours. If the glass flies under that test then the thing comes back to me, and that is the only thing that I have ever had the matter with my lamps.

3621. Have you ever found a difficulty in coming up to the standard of the colour of the green glass?—No, I brought this bottle of coloured fluid to show what we have to fall back upon. If the patterns get lost we need only make a saturated solution of sulphate of copper, and all we consider then is the degree of depth. If you look at that, end on, you will find that that will be pretty nearly the depth of colour required. This is a blue tint, but when I apply a yellow light to it (*lighting a match*) you see how the green is brought out.

3622. Therefore, a blue-green is considered the best colour?—I consider it the only colour; we call it "signal" green. Regarding the trouble we take when I order green, I have to get it specially made for myself, and to take an extra large quantity—in some cases as much as will last me for five or six years. Then before that was done with we would begin to look out for another lot, and it must be made to my tint, and I am to be the judge of it. You will find if you are looking at these two samples, that they are as near alike as possible. The bottle is a little darker colour than the glass when you look through the end.

3623. Besides the endurance tests, are the Admiralty lamps tested for penetration?—Yes, we have the photometric bar and if they do not come up to that, they are rejected altogether.

3624. Are the lamps supplied to the mercantile marine tested in anything like the same manner?—No.

3625. Not by the surveyors, or by anybody?—No, the surveyors' test is no test at all. Here is a case which took place some years ago. I was asked to go to Queenstown; it was about a matter of a collision, and I was wanted to make an examination of the lights, and upon receipt of a telegram I made my way on board. This case illustrates what I have said in a paper here: "Surveyors and the officials "ought to be fully instructed in the technical con- "struction of good ships' lights, and the instructions "should be clear and decided to enable them to make "an intelligent inspection of the lights, and not be "limited, as at the present time, to certain external "dimensions of non-essential parts." In these lights that I went to inspect I found the lens was of the prismatic form, but instead of the prism being formed to refract the rays of the light, they were made so as to reflect them back into the lamps. This is something like the form I found there (*producing a drawing*). The outer angle is something like a right angle; the

*Mr. W. Harvie.*

19 June 1895.

ray from the focus to one face of the prism is reflected to the other face and sent back into the lantern. Not a ray would go outside. You would know it was lit, but there was nothing you could see at a distance these lenses should not have been passed.

3626. You have had opportunities of judging; are you of opinion that the majority of the smaller class of steamers, such as what we call ocean tramps, are fitted with proper and serviceable bow-lights?—Well, you know, that that is rather a delicate question for me. I have always gone upon the plan of advocating my own wares, and I do not think it would be right for me to run down any other maker.

3627. Speaking of your own lamps, can you say—of course, you are limited to price very often—that you are able, for the price which is paid you, to supply proper serviceable lamps for that class of vessel?—Yes, I do it to many.

3628. At about what price?—I think the lowest would come out from 8*l.* to 10*l.* the set of three.

3629. Could you not supply serviceable lamps much cheaper than that?—No, the masthead light is a little more than the side light. I reckon the side light used to be made for about 3*l.* 10*s.*; I am speaking of copper lamps.

3630. (*Chairman.*) Is it necessary that they should be of copper; is not that a considerable expense?—Well, that adds to the expense, but they gain in durability. The salt water rusts iron very rapidly. In talking about the quality of the lights in the merchant service, I may mention that I have a strong conviction that you will never have proper lights in the merchant service until you have intelligent surveyors to look after them.

3631. (*Rear-Admiral Andoe.*) And do you consider that every lamp before it is accepted on board a ship for use ought to be inspected by a surveyor?—I do; and he ought to have a knowledge of what he is looking at, and should not require any machinery to know that he was right. There are a great many things, sir, that I have pointed out for years; they are gradually having them introduced here now. For instance, that 4° angle must be complied with no matter what trouble there is. Paragraph 10 refers to lenses which are coloured throughout—I have such a lens here to show the Committee. The paragraph says:—"The surveyor "should discourage the use of these lenses." I say that he ought to reject them.

3632. (*Captain Hallett.*) Which lens?—The solid lenses, because they are always defective.

3633. (*Rear-Admiral Andoe.*) It is what they call a fish globe lens?—*This* is the part they really call the fish globe. It is a globe cut into three.

3634. Is that a sufficient lens for a side light?—No, and there is not sufficient colour in it. There would be a difficulty in knowing whether that was a white light or not, and that is one advantage of this bottle. However little you may have of this colouring matter in your glass it always shows green.

3635. (*Chairman.*) So that you attach considerable importance to the exact shade of the light?—Yes, the tint. I supplied them with the cases of the proper tints for all the Board of Trade offices.

3636. What is *that* piece?—*That* is got out of a lens which was broken. I broke it up to show you. You will see from the depth of colouring there that the greatest search light would not penetrate it.

3637. (*Rear Admiral-Andoe.*) Is that a lens that is at all commonly used?—It is not so very common now, but it used to be; if I had been sufficiently well I should have gone down to the ship chandlers' shops to look, and, no doubt, you would get many more. I have long put these lights before the public, and I have long been advocating this alteration; they have been improved in recent years.

3638. Do you make any lenses at all like that?—No, I have never done so.

3639. You consider that they are so inferior that you would not make them?—No, because I put my name on all the lamps, and I would not do so on a lamp that I knew would not meet the requirements.

3640. I believe the Board of Trade advocate a white lamp or globe with a thin green shade inside?—Yes. I was the first to introduce that.

3641. Do you consider that is superior to having the lens itself coloured?—Yes, I have thrown cart loads actually of this sort into the dust heap before I adopted this one. In fact, I never could have carried on my business if I had continued to use that.

3642. (*Sir E. Harland.*) Is the colouring matter in a film on each side of the lens?—That is through and through; the film is on the ruby. The ruby is flashed generally on the lens. Before I adopted this plan of the slide, I had the green also flashed on, but not with the standard tint. There were little dark patches at parts, and you had always some regret at seeing it was not up to the mark. You could get the glass cut so as to cut off so much of it, but then it did not make a sufficient job.

3643. (*Rear-Admiral Andoe.*) Do you think if the old regulation had been left alone, and the 4° not introduced, that for all practical purposes, if it had been properly carried out, it would have been sufficient?—No doubt it would. There cannot be the slightest doubt that it would; in fact, I have never yet heard it said in any document or report, that there is any evidence of its being required there, and I have never heard any complaint outside about that. I remember the late James R. Napier—I took the trouble of getting a copy from Scotland—wrote a paper on it, but what he was complaining of at that time—this is in 1867, nearly 30 years ago—was that the Board of Trade were not doing their duty in attending to the screening of the lights. They were screened anyhow. That is an illustration which came out with the paper (*produced*). I think I have the paper. Of course, at that time, there were only two surveyors in Glasgow, an engineer and a shipwright surveyor, but now they have a regular army of surveyors, and I think they should have no difficulty in seeing to the screening. They only require to see that the others do it.

3644. (*Rear-Admiral Andoe.*) And also to see that the light is one which comes up to a certain specification, I suppose?—Yes.

3645. Do any of the photographs which you were showing to the Committee represent what you ordinarily supply to the Navy?—These are the lights here, and the centre one is the mast-head light. I think I have some more here.

3646. I want to see one supplied to the Navy?—They are pretty much all alike (*producing some more photographs*). These are the lights I supply to some of the tramps. Some of the tramps carry good lights.

3647. What would such lamps cost, do you think, the ones you supply to the tramps?—These, I think, are 15*l.* or 16*l.* the set of three.

3648. About 5*l.* each?—Yes, about that.

3649. And for that you can make a really good lamp?—A very good lamp.

3650. (*Chairman.*) Copper?—Copper.

3651. (*Mr. Ismay.*) Do you ever go to sea at all to judge of your lamps?—Well, I have not done so for many years. I do not go afloat now.

3652. But you have done so?—Yes, years ago. I sailed a good deal at one time. A captain on one of the mail steamers on the Clyde was complaining of the red light. He always maintained that his red light was not equal to the other lights in the fleet, and it was arranged that I should see it. I was staying down Dunoon way, and I knew the time that the steamer left Greenock and was on the look-out for it, and when he came down opposite me he took a turn of his ship's head on to where I was, and then went on. But I have had a good many opportunities of seeing and inspecting these lights in that way. Besides, I have been at sea considerably, although it is a long time ago.

3653. You mentioned Messrs. Burns's steamers. Do you know what they were screened at before the alteration?—Yes.

3654. What were they screened at?—Well, that is what I have been endeavouring to explain in this drawing; that it is somewhere about 2° measuring from the outer edge of the wick.

3655. And there the chocks were cut down to meet the Board of Trade requirements?—Well, if it had been only that there would have been less trouble in the matter. Then in addition to that we had this alteration of the wicks, the turning of the burners; in fact, I had to get a special burner made to comply with these requirements, because when you screw in a paraffin burner or a mineral oil burner, it gives in

like *that* (*describing*). We fix it to start with as it is required, but in a few days with the repeated screwing it gets further round, but I have a burner made specially fixed in a different way with two catches; but I do not suppose other makers have bothered themselves about it.

3656. Have you had any of your lamps found fault with by the Board of Trade surveyors?—Not for many years. The original tussle which I had with the late Mr. Gray I think settled the question. In point of fact, they had not another light out of the whole lot that met the requirements of the Act.

3657. Then you attach a great deal of importance to a good lamp, well fitted and well constructed?—Yes.

3658. And uniformity?—Yes. We cannot get them quite uniform. That would be practically impossible to do; we could not make them quite uniform.

3659. As near as may be?—As near as may be.

3660. Captain Hallett asked me to ask a couple of questions, as he had to leave to catch his train. He wanted me to ask you how you made your glasses, whether you cut them into three?—No, I do not do that at all; they are all made for myself.

3661. And then you divide them into three?—No, I do not; they are made singly.

3662. You make yours singly?—I make mine singly, each to suit its own lamp.

3663. Then you showed us how you produce the green light through the blue glass there?—The signal green, I would not call it blue.

3664. How do you obtain the same effect with the electric light?—The very same. The incandescent light is exactly the same as oil; that is to say, it is rather yellow. This rumpus about the effect of the light upon the green light was all nonsense. The Russian naval attaché mentioned to some of the Board of Trade officials that in the Russian Royal yacht the green light did not come well out; but I referred in my letter to the Board of Trade to the fact that I fitted the lights for the Russian yacht, and they were arc lights, Jablochkoff lights, which is a kind of arc; the signal green is not suitable for an arc light. Well, I went to the trouble of getting a spectroscope and testing the lights in every way, and there is not the slightest variation in the tint of the green required. But the arc lamp requires daylight green.

3665. That is whether the light is paraffin oil or electric?—It is all the same.

3666. (*Mr. Bolam.*) Do the Clyde surveyors compel you to put the wicks at right angles to the fore and aft line of the vessel?—Yes.

3667. Because the instruction issued to them is that the wick-holder should be placed in the position of greatest efficiency?—Well, that may be so, but the difficulty about the thing is that the surveyor will pull out his book and show you private instructions, and the book does not hold with that.

3668. In other words they interpret these instructions in that way, that they should be at right angles?—Yes.

3669. How would you place your wicks, if you had your own choice?—I would put them broad on the lens, but in a short time, as I was explaining, with the mineral oil, it gains a little in screwing. In fact, I never looked at the position of the wick; if it was within the focus, that is all practically I cared about.

3670. It is unimportant?—Yes.

3671. These photometric experiments you made were made with lamps which were properly focussed, and they showed that even with the best lamps we do not get a uniform light over the whole 10 points?—No.

3672. But practically uniform?—Yes.

3673. It only shows that in matters of this sort it is of no use bothering with infinitesimals?—Yes.

3674. Do you believe much in the photometric value of the luminosity of the lens?—The lens does not give any light at all; the lens is a transparent medium that the light passes through. It merely alters the direction, but it does not produce any light.

3675. That is to say it would do all that if the glass were absolutely perfect?—Yes.

3676. I want to know if you attach any value to what has been put forward by some witnesses here as to the distinct lighting value given by the lens?—I would attach no importance whatever to it; it is a light you can see from alongside of the lamp, but you do not see it any distance away.

3677. You have fitted your lamps yourself in a very large number of the best merchant ships in this country?—Yes.

3678. And you have personally superintended the placing of these lamps yourself?—A great many of them.

3679. And you can say with absolute certainty that previous to the 4° rule coming in, the inside of the wick, and the inside of the lens, and the outer edge of the chock, were all in the same fore and aft line?—In a line.

3680. And therefore in all these vessels to which your lamps have been fitted a 4° angle must have increased the angling from the outside of the wick?—Most undoubtedly. Many ships fitted with my lights take great trouble to keep them right; for instance, a lot of the German lines and the French steamers that have been supplied by me, get instructions from my men to fit them.

3681. (*Mr. Scrutton.*) Did I understand you to say that mineral oil without a chimney is not up to much?—No. It is not up to much.

3682. You regard a chimney as essential. Would you make the length of the wick absolute, or would you allow variation?—The width you mean.

3683. Yes?—Well, of course you know if you required a light to show two miles, it is an easy matter to find what sized wick is required; once you find that out, then that should be the size of your wick; nothing less, because I hold that in all cases at the trial you ought to have some spare power; the lamp is not always so well trimmed, and unless you have originally to begin with some spare power the chances are it will not show the distance.

3684. Do you see any difficulty in making a standard lamp, or requiring a standard lamp as to the lens, and as to the position of the wick?—None whatever; any of my lamps would do for that.

3685. Do you think it would be an easy thing, supposing that it were a matter of legal requirement, that the lens should be of a certain colour; do you think that could be easily carried out?—Yes, I think that should be imperative—the colour. I have advocated that for years, because there is nothing which has done more injury than defective colour. I have seen vessels with glasses in their lamps of such a sort that you would not see them at the bow of the ship—no light at all—and yet it is not for cheapness. I would not run down the ship owners, but really they do not know—they are imposed upon, and I say the surveyors ought to be competent when they look at a thing to reject such a thing as that. I do not think there are many of them now, but there used to be plenty. (*Referring to a thick dark glass.*)

3686. (*Sir E. Harland.*) Some of the information you have given us refers to the angle of screening?—Yes.

3687. I suppose you went into this question, and you gave it consideration, not so much as a necessity upon the part of a manufacturer of lamps, as on account of the inferior treatment, one may say, your lamps received by being placed differently according to varied methods of screening?—Well, I may mention that the question of screening is a thing which was at the time taken up by myself in my own interest, because in cases where a vessel has a tower the carpenter gets inside the tower and cannot tell almost the head from the stern of the ship, and the chances are that the lights would not be properly fitted; so I take it upon myself to go down and attend to that part of it. I have no charge, and I have no order to do so, but I make a point of doing so in my own interest.

3688. In the early days of lamp making was it the case that the fish globe glasses which were generally in use then were made in one globe, which was cut into three?—Yes, that is done yet, by thousands.

3689. Is that sufficient to enable the light to show over the 10 points?—Yes, if you cut out a third of a circle you have a little left for fitting; you have more than sufficient, because previous to the 4° angle, all you required was 112½°. That is not quite the third of a circle, and leaves a little margin for fitting.

3690. So that when ships were more generally fitted with these fish-globe glasses, the glasses, if they showed

*Mr. W. Harvie.*

19 June 1895.

the 2 points abaft the beam, could not show across the bow to such an extent as 4° or 5°?—I do not think they would be long enough for that.

3691. Coming to the recent order which is supposed to have increased the angle of screening, has it driven you to the necessity of extending the circle of your lens?—Yes, lengthening it.

3692. So as to prevent the inner edge of the lens from interfering with the 4° of screening?—Quite so.

3693. But so far as you as a lamp maker are concerned, the screen in question, strictly speaking, has nothing whatever to do with your department?—No.

3694. Would you advocate fixing a standard pattern or standard lamp?—I have a letter on that subject here which was written to the Board of Trade. Perhaps you will allow me to read it:—"Glasgow, 6th. July, 1891. "Dear sir, I do not see any difficulty in surveyors testing "signal lights in a thorough manner after they have "been properly instructed, and are in possession of suit- "able apparatus for this purpose. If it cannot be done "on board the ship it could be done at the Board of "Trade Offices; the lamps being sent there for this "purpose. Before, however, going into the details of "'Instructions to Surveyors for testing Lamps' I "consider it will be necessary to decide first, by "further experiments at Shoeburyness or elsewhere, "what is the least power admissible. This can be "done by fitting various sized burners to the lanterns "recently supplied, and noting the distances at which "the light can be seen. In this way you would arrive "at a lesser standard of lantern which might be "permissible for smaller craft. It would be a guide to "me in future experiments if you could inform me "at what distances the light can be seen in the lanterns "recently supplied, but, meanwhile, it would be a "great step in advance if all solid coloured lenses "were condemned, more especially the green lenses. "There is not one of them can show the light "the required distance, a fact which would be "easy for you to prove by borrowing lanterns from "some of the ship chandlers or lamp makers. You "will not require a very long range until you will lose "sight of them altogether. The red lenses are not "so faulty, as it is only a thin film of red that is "usually flashed on the inside of the lens; there are "some of them, however, which are very bad. Another "very serious defect, which you should have no "hesitation in condemning, is the usual system of "fitting a colza oil burner and a mineral oil burner to "the same fount, the difference in height in some "instances being over two inches. This difference in "height is supposed to be corrected by having two "sliding grooves at different heights for the lamps to "be slipped into. You will understand, however, that "a boy in the hurry of trimming the lamps is quite as "liable to put it into the wrong groove as into the "right one. I have always made it a point to supply a "separate fount of the correct height, and properly "focussed for each kind of oil."

3695. To what point did that letter refer?—It referred to the instructions to surveyors.

3696. Then you are in favour of some such general directions being given in the future for the construction of lamps?—Most distinctly.

3697. Then would you be in favour of fixing the distance from, say, the centre of the wick to the inner face of the lamp, so that when a strange lamp were fitted it would ensure the same amount of screening? Would that be your idea?—I think the present measurement of what you may term the external dimensions of the lamp have been so many years now insisted upon that I do not think there should be any alteration made in them. The inspection I would like to see would be more of an optical kind; to see that they are really right as optical instruments, and comply with the law in that respect.

3698. If the light is to be always screened to a definite angle, can lamps be interchangeable unless there is a fixed measurement from the wick to the inner edge of the lamp?—That would be quite easy to lay down.

3699. But would you advocate that?—I have no objection to it.

3700. But could you do without it?—You must have some uniformity some way, and one must take a little time to think over the details of that sort.

3701. Suppose that the screening were found to be accurate with a lamp in which the wick was so many inches distant from the side of the lantern; if you substitute another lantern of a different measurement, would not that make a material alteration?—It must do so.

3702. Then would it not be necessary that there should be a standard distance from the inner edge of the wick to the frame of the lamp?—Yes, of course. It might vary in different classes of vessels. Some very small craft are perhaps only 20 feet broad, and they need not take these very large lamps. I think in these cases a smaller lamp might be adequate.

3703. Assume that there were three sizes of lamps. No. 1 lamp, which was a certain distance from the wick to the inner surface of the lantern; No. 2 lamp, for smaller ships of another gauge; and No. 3 lamp for the smallest; would it not follow that each of these three classes of ships would invariably carry their own particular class of lamp, and in that case would they not be able to change their lamps and yet retain the accuracy of their screening?—I think, as regards that, the larger vessels always want something better, as good as can be got, and I do not think they will be guided by a direction of this sort, to have the lamps interchangeable.

3704. It is only the point I wish to draw your attention to, not to the precise manufacture?—As regards the power and the size, the large companies, I know, will have the best they can.

3705. Supposing such a restriction were made by the Board of Trade, you see no reason against it; you, as a lamp maker, being left free to improve the lamp with regard to its strength and its lighting capacity?—Yes; just to keep to these dimensions; I do not see any difficulty.

3706. Would you advocate the centre of the wick, in that case, being taken for the measurement, or would you take the inner edge or the outer edge of the wick, in view of various arrangements of wicks, and in view of the electric light being used?—I think the centre would be proper.

3707. Now as regards the centre, you have advocated, and one of your drawings shows, a duplex burner, and in that I notice you have two separate regulators for each wick, is that so?—That is the big drawings, that is colza oil.

3708. Do you think that is a better plan?—Yes.

3709. Would you recommend that for all classes of oil?—No; that is a special thing that I make myself.

3710. Then it is bound to be very good. And in that case would you not recommend that each wick should have its own regulating screw?—Yes, I do not approve of the one screw.

3711. Where there is only one screw have you found that one wick would be elevated or depressed at a different rate to the other?—Yes.

3712. Hence you prefer each wick to have its own screw?—Yes, I would not have it otherwise.

3713. A duplex wick represents very nearly a circular column of light?—Yes, it approaches that more than anything else.

3714. Then does that account for your remark that there would be no difficulty as to whether the wick was at right angles to the centre line of the ship, or fore and aft, or otherwise?—Yes, in either case, with two wicks, there is not much difference.

3715. And there is less difference with one wick?—No, but it is sufficient for all practical purposes.

3716. You would advocate two?—Yes. You could hardly have a sufficient power with one wick.

3717. Would you say that the breadth of the light produced by an incandescent light would be pretty much the same as the breadth of the light, from, say, a duplex burner?—Quite the same whether you stand it edge on or flat; there would be very little difference.

3718. So that with a duplex burner and with an incandescent light you have pretty much an uniform width of light, never mind how the light stands in the lantern?—Yes, providing it is within the focus.

3719. If you were not obliged by the recent order of the Board of Trade to put the wick at an angle of 45°, you would be freer to have your adjusting screws applied at the proper position in the lantern of the lamp. In this drawing which you have submitted, I notice that your adjusting screws are square in from the side of the lamp?—Exactly.

3720. Supposing that you were required to have these wicks at an angle of 45°, you could not have it?—I could not have it with that construction.

3721. So that this regulation, that the wick should be at an angle, interferes with the lamp maker putting this adjusting screw either on the one side or the other?—Quite so, it is quite unnecessary.

3722. You therefore would advocate that the wicks should be parallel to the keel or at right angles to the keel?—I would leave that matter open, because the burners change of themselves with the working; that is to say, by the repeated use of the screw it would become parallel with the keel.

3723. You referred to lamps being on gimbals. Have you seen a lamp which was before the Committee made for Mr. Corry, which was on gimbals?—No.

3724. Have you made many lamps on gimbals?—Yes.

3725. Do you think that being on gimbals makes the light plainer?—Yes, that is one of the greatest advantages of the light towers; it enables a proper fitting of the lamp in the tower.

3726. Have you ever tried lamps canted over to a considerable number of degrees to port or starboard?—Yes, the difficulty of that is that it is not so suitable for oil. When you have them canted over the oil runs out, and when you have the lamps in other positions the oil flows up and puts out the light.

3727. So you think there is an advantage in having lamps on gimbals?—Yes, but the great majority of shipowners cannot fit them on gimbals; they have not room or accommodation, and to recommend that all the lights should be on gimbals would be to recommend an impossibility.

3728. Are your lenses ground at all, or are they simply cast in moulds?—They are all pressed in moulds, and afterwards cut off; you cannot make a proper lens without cutting it.

3729. That is skinned; cut over, through the grind stone?—A glass cutter, yes; this is one here.

3730. But are you aware that there are dioptric lenses in use which are simply cast?—Yes.

3731. Of more or less accuracy?—Yes, approaching something like accuracy.

3732. Do you prefer them to be ground or cut?—Cut glass.

3733. You refer to the light from such lenses being a sheet of light. Do you mean a sheet of light horizontally or vertically?—Horizontally; if you had an arc-light in the focus of an accurate lens you would simply have a sheet of light. With an oil burner you have a larger flame, and the result is that your sheet of light is a little thicker, but nevertheless it is still a sheet of light of great thickness, and it does not diverge up and down.

3734. Do you advocate the dioptric lens for ships?—Yes.

3735. Supposing a ship to be very much by the stern, or by the bows, the sheet of light would be still sent straight forward by the dioptric lenses?—But I do not advocate lenses of that kind. At the time 20° divergence was mentioned, that was the question we were speaking of. I never would propose a lens without the divergence for navigation. You must have at least 10° of divergence.

3736. That is to say, that if the ship were loaded by the stern 10°, a vessel ahead would still see the light in full force?—Yes, I do not think 10° is a guide.

3737. Assume, for instance, that the ship were in distress and sinking by the stern, and under such circumstances she was not able to readjust her side lights, do you think that the dioptric lens to which you are referring as driving forward a sheet of light, would be desirable?—I think not. You will never have a light of sufficient power without a lens. Of course, I know the word "dioptric" and all that sort of thing has been pretty commonly cast about, but plano-convex for instance is dioptric. The proper term to describe that is "prismatic."

3738. In the way you cut them there would still be ample margin for the vessel to be either down by the head or by the stern without interfering with the due fulfilment of the values of the light ahead?—Quite so. I would not advocate that. That would not be sufficient. Of course, when you have a vessel with 20° of permanent list, then your oil lamp is not suitable in that position.

3739. Are there any other particulars besides distance from the centre of the wick to the face of the lantern, upon which you think such an authority as the Board of Trade should make a regulation in order to make the lights more or less interchangeable?—Well, I could hardly say right off from memory; I must think over the matter.

3740. Would you advocate that the green light should always be illuminated by a duplex burner as against a single wick for the red?—I would illuminate the whole of them with a duplex.

3741. You do not see your way to any method of extra lighting to bring the green light up to the red in strength for distant observation?—Well, I do not think that is necessary; the regulation says 2 miles, but it does not say it is not to show it 3 miles. It is not to be less.

3742. But do you recognise the importance of both lights being seen at the same distance?—Well, I do not know that I could easily deal with that.

3743. Supposing, for instance, that a vessel were coming down upon you at, say, 3 miles distance, which no doubt is a long distance for you to make up your mind as to what you are going to do, and then you only saw the red light, though the green light is really showing excepting that it was very much weaker?—Yes, but if the ship were under way it would only be for an instant or two, because the green would come in directly if you once saw the red light. But I tell you what I saw when I was on board of a certain company's vessel. I was then fitting the electric light, and the superintendent told me he was putting in two 100-candle lamps, and possibly they might go in for 200-candle lamps. I said, "You know if you put in power of that "sort you will not require any lens at all." But the lamps which he had put in I pointed out to him were completely out of place, so he asked me to write up to him after I got home about them, and I did so.

3744. In the experiments you described previously the light was not of the same strength at different points. Do you think that such variation is due to the fact that the reflector cannot be, or is not usually, made to extend as far round as it might be?—There is no doubt that the reflector must cause a variation, although you cannot easily trace it. You have a reflector, for instance, *there*; when you come *here* it is different.

3745. Do you see any objection whatever to the reflector coming round so far as at least not to interfere with the two points abaft the beam, and to come round as far on the other side as not to interfere with the angle of screening?—There would be no good in making it more than the half circle, certainly.

3746. Would you advocate the half circle?—Well, I do not know that there would be much advantage when you come to these extreme points.

3747. But taking this lamp in which the reflector stops short at *this* point, are you not willing to admit that a considerable amount of reflection is wasted for want of this little arrangement?—There is no doubt there is light lost passing through, whereas it would be reflected to the focus *here* if you had a reflector *there*.

3748. So you think the reflectors also might be improved with a view of utilising more completely the value of the light?—Yes, that was Mr. Thomas Stephenson's great idea, to utilise the whole light.

3749. (*Rear-Admiral Andoe.*) You did not mean to imply just now that the Admiralty lights supplied by you were not very good, did you?—No, they are the very best lights.

## Thursday, 20th June 1895.

PRESENT:

The RIGHT HON. SIR F. H. JEUNE IN THE CHAIR.

Rear-Admiral ANDOE.
Mr. BOLAM.
Captain CASTLE.
Sir EDWARD HARLAND.
Mr. ISMAY.
Mr. SCRUTTON.

Mr. C. HIPWOOD, *Secretary*.

*Capt. W. S. Wade.*

20 June 1895.

Captain WENTWORTH SHIELDS WADE called and examined.

3750. (*Chairman.*) You are a shipmaster, I believe? What is the length of your experience?—Thirty-three years.

3751. In what company are you now?—In the Waterford Steamship Company.

3752. Their vessels run between Liverpool and the Bristol Channel and Waterford?—Yes.

3753. Have you had experience in the coasting and channel trades?—I have had about 15 years' experience as master.

3754. Do you hold any pilotage certificate?—I hold five pilotage certificates.

3755. And during what part of the year are you navigating the Channels?—At the present time I am navigating the Channels about half the year.

3756. Have you had experience besides in the Atlantic and foreign trades?—I have had 18 years' experience in the Atlantic and foreign trades.

3757. I believe you are a member, are you not, of the Council of the Mercantile Marine Service Association?—I am.

3758. How is that body composed?—It is composed of certificated shipmasters, officers, and a few engineers.

3759. About what number?—Well, I think there are not more than about 20 engineers.

3760. But I mean what is the total number?—About 3,000 members.

3761. I believe it is connected in a friendly way with the leading shipowners in Liverpool and elsewhere?—We are.

3762. And you desire, I believe, to give evidence as the representative of that body?—That is so.

3763. Can you tell us briefly what experience you have had in the screening of ships' side-lights?—I have had a good deal of experience. For many years I have studied the question as a practical man, and have had many opportunities of doing so in the ships of our fleet and in others. I may state at the outset that the fundamental principle of side-lights is implied in the name itself, and they were originally intended to show an approaching vessel on which side she was, and the utmost precaution was taken that side-lights should not be seen across the bow; hence the very clear and sailor-like language of the international regulations. Until recently the side-lights of all ships I have commanded or been acquainted with have been screened in accordance with the international law; that is, parallel with the line of keel.

3764. By parallel with the line of keel do you mean screened to the inner edge of the wick or to the outer edge of the wick?—The ships of the company in whose service I am now, before they were altered, were all screened to the outer edge of the wick parallel with the line of the keel.

3765. Have you found that efficient lights so screened have sufficiently converged ahead?—That is our experience.

3766. Have you any special knowledge of the effect of side-lights when screened to that angle?—I have; the ships which belong to our firm are 14, and I will give you the date of their screening. Twelve of those ships were formerly screened parallel with the line of the keel, and have all been altered by the Board of Trade instructions to a 4° angle. Ten of these ships carry passengers, and the other two are cargo boats. The two other ships to make up the 14 are new vessels built since this regulation has been in force, and I did not quote them; they are screened to the 4° angle. I may say that these vessels were formerly screened to the outer edge of the wick, parallel with the keel, and since then the chock has been reduced 2½ inches to give the 4° angle. The effect of this alteration has been that I have observed both side-lights on the forecastle head of three of these ships, one being especially apparent owing to the superior quality of her lamps, the largest and best lamps made.

3767. What other information can you give us illustrating the crossing of the screening?—1st. In very narrow waters you would put your vessel ashore before you could shut in the green light of an approaching vessel, and this frequently takes place and has occurred to myself in the River Avon. 2nd. When meeting a number of vessels in narrow water such as the Mersey and going the opposite way, one of them was showing us his red light a little on the port bow and four others were showing their green light on the starboard bow, and the nearer one of these latter got a glimpse of our port light and ported, calling upon us to do the same. The other three in turn seeing our red light due to our porting, we had to port for the whole lot, running right across the river and across the hawse of everything to an anchor with a strong flood tide running. In this case I had to keep under the port helm and take a round turn out of her, as I was too far over to recover under my starboard helm. 3rd. Meeting a steamer on your starboard bow showing her green light to your green you keep on your course, the officer in charge of the other ship thinks he had better starboard a little to give you more room, but just as he elects to do so, you get a glimpse of his port light and port; as he has starboarded you fly off towards one another, with the consequent danger of collision due to the fact that your lights show across the bow. I have had some bad examples of this. 4th. Two steamers meeting and seeing one another's green lights narrow on their starboard bows, both may say safety and keep their course, but when getting close together one gets a glimpse of the other's red light owing to its being screened to show across the bow, and at the last minute ports at the serious risk of collision. This I have frequent experience of. This green to green narrow on the bow is a position of very great danger, and has been much increased by the side-lights being allowed to show across the bow. This Rule much needs amending.

3768. Which Rule needs amending? I hardly understand exactly what you mean to convey. Is it the rule that you must port that you refer to?—No, under those conditions you would not be called upon to port.

3769. If you saw green to green very narrow on the bow, what, at present, would you consider it right to do?—It is the invariable practice to starboard a little and give the ship more room.

3770. So that in your view it is desirable under those circumstances not to catch the glimpse of the red, because if you do, that suggests to you that you ought not to starboard, but to port?—That is so, but it has happened as I pointed out in one of those examples, that just before the ship had starboarded to give you more room you had seen his red light ported, and were called upon to port, which you did. In that case it was just a question of sea-room, whether you clear one another. Then there is another note. I have frequently met steamers in the early morning and on

clear moonlight nights when I could see the vessels' hulls plainly, and that they were heading in such a direction as would go well clear of us, but at the same time both side-lights were plainly visible. I could state instances of such positions that have occurred to myself since the Order in Council of 1893. All the steamers of the company that I am in were screened in a line parallel with the keel and have since been altered to the 4° angle.

3771. Do lamps of good power show across the bow more than lamps of less power?—They do.

3772. Is it your opinion that lamps should be screened to the outer edge of the wick?—That is my view.

3773. You also, I think, attach importance to the lamps being of uniform power and being thoroughly efficient?—Yes.

3774. What objections have you to state as to the Order in Council altering, or professedly explaining, the international law?—First, we object most strongly to the Board of Trade obtaining an Order in Council in entire opposition to the expressed opinion of the shipping interests of the country, those interests having no voice in the matter, and my association have petitioned Parliament on this subject. I might add that no notice was taken of it.

3775. (*Mr. Bolam.*) You have petitioned against the Order?—Against the Order. Now the Order in Council has so altered the language of the International Regulations that the words "shall not be seen across the bows"—which every sailor knows to mean by other ships—now reads "shall not show across the bow of "the ship itself." When lights are screened in accordance with the International Regulations in a line with the keel, and so as to be visible from right ahead of the light to two points abaft the beam, lights so screened are clearly visible ahead of the ship, and in practice there is no such thing as a dark lane; the glass of the light being an arc of a circle shows a ray of light converging ahead of the ship. Should such a thing as a dark lane exist, it could only occupy the beam of the ship, and as all vessels go off their course more or less in steering, you would open and shut their lights, and in the case of steamers (which are the great majority) you have masthead lights. In any case a dark lane would be preferable to the present squinting lights, tending as they do to danger.

3776. (*Chairman.*) I think you have a diagram here, have you not, showing the erratic steering of steam and hydraulic steering vessels?—I have (*produced*). This is a diagram taken by electric apparatus attached to the compass of the Isle of Man steamers from Liverpool to Douglas. That is the Bar lightship, or the Formby lightship, from which she takes her departure.

3777. Do these represent the course of the vessel?—These represent the variations in the course of the vessel over the voyage.

3778. (*Sir. E. Harland.*) Magnified, of course?—Well, to get a correct interpretation of that, you would have to extend that over a distance of 60 miles, and then take the proportion of those; it looks rather misleading.

3779. (*Mr. Bolam.*) Could the witness state whether the scale of the diagram breadthways is the same as the scale of the diagram lengthways, because that is a very important point. It is a common plan to increase the scale in one direction for certain diagram purposes?—I could not say. I have got the diagram just as it is, and I did not get any further explanation more than what you see. Of course, some of the greater deviations from the course may be due to the altering the ship's helm to avoid other vessels.

3781. (*Rear-Admiral Andoe.*) *That* line does not represent the course of the ship, does it?—It represents the deviation from the course.

3782. Does it; it is nearly at right angles to the course?—As I said before, you would have to extend this to the length of the course steered to arrive at a satisfactory conclusion. These are for the purpose of ascertaining whether you have made a course good by running a line through the centre of them, and then you see which side of your course you have deviated most; it was not intended for this purpose only. I thought it would probably illustrate the fact that the ship would not keep straight on.

3783. (*Chairman.*) I dare say you could tell us from your own experience within what distance each way vessels will steer?—Well, our vessels are among the best steering vessels in the Channel, I should think.

3784. What do you keep to?—Well, one vessel that I have commanded you could keep her within about 1° of each side of her course.

3785. That is very good, is it not?—She is the best steering vessel I ever was in, with the exception of some of the White Star steamers in the Atlantic trade.

3786. (*Mr. Bolam.*) One degree each side?—Yes.

3787. That is 2° of variation?—Yes.

3788. (*Chairman.*) That is very good, is it not?—Yes, it is very good steering, and only experienced men that are in the habit of steering those vessels could keep them so close to the course as that.

3789. When the side-lights are allowed to show across the bows, is the appearance of the lights at their respective heights altered?—It is; there is some optical delusion arises due to the angle which gives them a very peculiar appearance; one light appears higher than the other. I never noticed this particularly before this angle had been introduced, and it was meeting our own ships as we sailed from each side on the same day, we always met in the channel, and I noticed they appeared to me to have a list, and a heavy list; and in speaking to another captain I said, "Your ship has a very heavy list." He said, "No," and it was in that way that I first noticed it.

3790. Now, as to the placing of the side-lights; where do you think they ought to be placed?—We are of opinion that amidships abaft the masthead light is the best position for a side-light; by that means you get the angle from the masthead light, and it gives you the earliest and clearest indication of the alteration of course that may be taking place and the direction in which the ship's head is.

3791. I should just like to be quite certain I am right. As I understand it, you state that your ships before the last alteration were screened in a line with the keel to the outer edge of the wick?—That was how our ships were screened. I have got the entry here from data that I took off the ships. The "Dunbrody" is the ship I commanded myself, and in her the lights are visible at 96 feet ahead of the lights; that is, at the stem.

3792. That is as at present screened?—Yes, and in that vessel 2½ inches were taken off the chock.

3793. In order get to the 4°, I understand?—To bring the light into the 4° angle. In the "Lara," the ship that I was in for seven or eight years, the lights are both very plainly visible on the forecastle at about 95 feet ahead of the light. They become quite blinding in working the rivers, so much so that it becomes absolutely necessary with the green light to have a man to hold a canvas screen to prevent its throwing on the ship and blinding you. Immediately you saw anything coming the screen was removed; but I have frequently in a river gone aground on the banks, which was due to the fact that you could not see anything with the light illuminating the ship herself.

3794. (*Mr. Ismay.*) Across the forecastle?—Across the forecastle. The ship was altered, and 2½ inches came off the chock at the end of the screen, and she ran for 12 months like that; she was re-surveyed, and the Board of Trade Surveyor on the completion of his survey instructed me to to take another half inch off the chock, which I declined to do, and it has not been done yet. I had very serious thoughts of putting a large piece on to the chock, because of the difficulty that we got into through the way that the ship's lights were screened. They show me the danger that we are being led into. The only time I have been in danger of collision when in charge of the ship myself in clear weather has been due to the lights showing across the bow, and these lights have kept me on my feet many a night when I should not have been, just because the traffic was pretty close and you did not feel safe. There is one other ship, the "Creaden"; I measured her lights and she is an altered ship, and I find, as she stands now altered, that she is screened to 4 inches to the inside of the wick, or to 5 inches to the outside; both her side lights are plainly visible 70 feet ahead of the lights.

(*Chairman.*) I do not know what that would be in degrees.

*Capt. W. S. Wade.*

20 June 1895.

3795. (*Mr. Bolam.*) That is 5 inches in 36?—5 inches, yes.

3796. That would be 8° from the outside of the wick fully?—Yes, that is what it is in the ship; it is just double the angle in the vessel that it ought to be.

3797. (*Mr. Ismay.*) Has she been passed by the Board of Trade surveyor?—She was altered to that by him.

3798. (*Mr. Bolam.*) Is that one of your ships?—Yes; she is one of their own altering; all these ships were altered.

3799. (*Mr. Ismay.*) Where were they altered, in Liverpool or Waterford?—I could not just say where this vessel was altered, but I think Liverpool; but they have been altered in Waterford and Liverpool and in Cardiff, three different ports. Two of the ships in Cardiff, and, I think, five of them in Liverpool, the remainder would be done in Waterford. We also have a new ship, a cargo vessel. I attended to the construction of that ship, and I see that she is screened to an inch and one-eighth to the inside of the wick.

3800. (*Sir E. Harland.*) Perhaps the witness would explain on a map like this (*map produced*) where the inch and one-eighth is measured from?—The inch and one-eighth would measure thus: the outside end of the screen was an inch and one-eighth inside the inner edge of the wick.

3801. (*Mr. Bolam.*) And how much does the wick stand perpendicular to the fore and aft line of the ship? Never mind the size of the wick actually, but *this* way. Would it have an inch, or half an inch, or what?—It is an inch wick.

3802. That is 2 inches and one-eighth in a 36-foot screen?—Yes, these were just observations that I have taken myself off the ships from time to time as I have had an opportunity.

3803. (*Sir E. Harland.*) The inch and one-eighth to which you refer here is 4° from the outside of the wick?—I beg your pardon. I do not really think that this $2\frac{1}{8}$ inches from the outside of the wick would give the 4° angle; in this case you only get $2\frac{1}{4}$ inches.

3804. (*Mr. Bolam.*) It is $3\frac{1}{2}$°?—Hardly that. From our standpoint we do not object to screening to a less angle, quite the reverse. Only it just shows the way that this sort of work was being attended to, that though they profess to screen the lights accurately, it is not done accurately.

3805. (*Chairman.*) But, as I understand your argument, you would rather be in favour of screening to the outer edge of the wick in a line with the keel?—That is our view; and the fact that they were screened in this way is proved by the Board of Trade surveyors themselves, because they took $2\frac{1}{2}$ inches off the end of the screen, which exactly makes the difference. Well, in those series of years in meeting those vessels I never saw them in any position where I could not see both side-lights when ahead of the ship.

3806. You said you laid great stress on fulfilling the obligation that they are to be seen right ahead, but an unbroken line of light would not be seen right ahead even of the lamp itself, if you screen to the outer edge of the wick, would it?—Well, we found in practice that it was so on one of our vessels before this Order in Council came into effect. But when the Instructions to Surveyors came out in 1892, it was handed to me to comply with in respect to a new ship. After completing the new vessel, I went and made a series of experiments upon one of our older ships with Harvie's best lights, the best he made at the time, and I found by screening to the outside edge of the wick, and going a matter of 600 feet ahead of the ship in the dock, I could see both these side-lights perfectly plain. That was in the dock, and on the ship herself. I screened the lights in several ways. I tried it with the angle, and tried it with the inside of the wick, and tried as she had been screened up to that time, that is, to the outside of the wick, and I found that at the end of the dock—it was not a large dock—that I could see both the side-lights quite plainly, when screened to the outside of the wick.

3807. (*Rear-Admiral Andoe.*) Originally the Board of Trade laid down that the line drawn from the inner edge of the wick to the outer edge of the chock was to be parallel to the keel. In view of that regulation, how was it that you screened your lamps from the outer edge, so as to obscure the actual rays of the light from the lamp itself from being shown right ahead of the lamp?—Previous to the Instructions to the Surveyors of 1892, I have never known a Board of Trade Surveyor to measure any chock or light screen or anything connected with it, with the exception of examining the lamps when they were unshipped to see that they were efficient articles—I have never—and my experience at sea has been in passenger vessels—vessels which hold a passenger certificate from the Board of Trade—up to this period known of a Board of Trade surveyor taking and measuring the screens or anything connected with them in passing his survey.

3808. But you say that the chocks projected sufficiently from the screen to obscure the lights from right ahead of the ship?—The chock projected sufficiently to be in a line with the outer edge of the wick, but we never found that it had obscured the light from ahead of the lamp.

3809. But, as a matter of fact, if you had the chock immediately in front of the wick it must have obscured the light from the wick itself, and all the light you had ahead of the ship was due to what was seen from the glass?—Well, I may just say this upon the question of optics. I do not know anything about them. All that I may know has been gathered from the lights and the position of them; it has just been from the experience that I have had in dealing with them, and measuring the results of the different means of screening. But my experience with the lights has been that bringing the chock to the outer edge of the wick does not prevent the light from being seen clear ahead of the ship and seen clearly.

3810. Although it must obscure the light which comes from the wick, considering it cuts it off?—How the light gets there—well, I was going to say it was really no concern of mine, but the fact that is does get there is quite apparent to me.

3811. With regard to the fine screening. Does not the yawing of vessels have very much the same effect at sea as coarse screening?—I presume by coarse screening you refer to the angle across the bow?

3812. Yes, I mean that; say a quarter of a point?—If you want safety in dealing with another ship you want fine screening, because you cut off your light then, and you show a ship at once what side she is on. As far as the rest is concerned, you must leave it to the seamen in charge to judge what is a sufficient distance from another vessel to keep clear of collision or anything approaching danger.

3813. The Board of Trade contend that the object of coarse screening is that two vessels approaching one another slightly on one bow will show both lights in sufficient time to enable them to port their helms in good time to keep clear of one another; what do you think of that?—I am afraid that idea of the Board of Trade with regard to port helm has been given out in such a way that a great many seamen—they are getting rid of it now to a very great extent, but up to a few years ago it was a very prevalent idea of a great many seamen that you always had to port. It is a bad thing to inculcate into a seaman's mind that he has to port, because you must always take into consideration the dangers of navigation; in the other vessel it may not always be prudent to port, and in many cases the Board of Trade in their instructions have put into the minds of many seamen that if they do not do that they get into trouble—that they will be wrong when they do not—in fact, practically, they are told whatever they do different to that it is wrong, and their minds are biassed, which is not a good thing.

3814. Suppose two ships are approaching each other, and you saw two lights on your starboard bow in consequence of the other yawing, what would be your duty to fulfil the law?—Well, I presume that you also would be showing your green light. Both ships would be showing their green lights to one another.

3815. Yes, both green and red, both lights in consequence of yawing?—Of course, as soon as the red light became visible with ships meeting end on, or nearly so, it is your duty to port.

3816. And coarse screening, you think, makes vessels cross each other's bows unnecessarily so as to fulfil the law?—Coarse screening does this. Two vessels have one another on the starboard bow, narrow, each seeing the green light of the other; one vessel says, "We are "going rather too close, I will starboard," but just as he is in the act of starboarding he has yawed a little under his port helm, perhaps, and shown his red light; the vessel opposite to him has seen that red light and ported. Here is one vessel acting under

the influence of a port helm and the other vessel under the influence of the starboard helm, and it is just a question of sea room whether they come together.

3817. Then do you think by fine screening the danger would be reduced?—I do. In fact, I have never seen that danger previous to this Order in Council, where we have been compelled to screen the lights across.

3818. Are you aware that the majority, perhaps, of ships were screened to more than 4° before this Order came out?—No, I was not aware of it. I am sure that I should be very chary in believing that such was the case.

3819. Because I think we have it in evidence?

(*Chairman.*) I think the evidence on the whole has become very doubtful. There are many cases, no doubt.

(*Witness.*) Are there any of the large lines out of Liverpool or elsewhere?

3820. (*Rear-Admiral Andoe.*) I could not say; probably they are more finely screened from the evidence we have?—Well, from my own knowledge, going through the Board of Trade surveys, and the entire absence of attention to the light screens and everything connected with that portion of it, I should be very doubtful of any statement that was made by Board of Trade surveyors as to lights being shown at a larger angle previous to that Order in Council.

3821. Is it within your knowledge, and not only of your own knowledge, but the knowledge of the gentlemen you represent, that the checks have been reduced as a rule in consequence of the Board of Trade new regulation?—That is the universal experience.

3822. You said just now that the White Star Line steered particularly well, I think, did you not?—Yes.

3823. Can you give me any reason for that?—Well, they are fine line ships, and long ships, and you invariably find such ships as that steer better than others.

3824. Do they steer better than the P. & O. steamers, or the Cunarders?—I have no knowledge of those ships; but in one ship of the White Star that I was in, the "Celtic," we ran for seven consecutive days without taking observations, and we found by dead reckoning and observations that there was only a difference of a mile in the distance. You may judge what sort of steering that means to arrive at that conclusion, but it was a notable instance The next day we made the Irish land.

3825. Regarding the position of side-lights to the masthead light, I think you said that you preferred them abaft the masthead light?—Certainly.

3826. Do you think that a better position than immediately below the masthead light, that is to say, immediately in a line with the masthead light?—I think there can be but one worse position than being in a line with a masthead light, and that is before it.

3827. (*Mr. Ismay*) You say, Captain Wade, that you represent the Mercantile Marine Service Association?—That is so.

3828. And that you have in all 3,000 officers and engineers?—Yes; but we have very few engineers.

3829. Chiefly officers?—Chiefly officers and masters.

3830. Do you know if there is any section that is in favour of the 4° screening?—I have never heard anyone express an opinion in favour of it.

3831. Might I ask then what has given rise to the strong feeling on the part of your association against the 4° screening?—The danger of it.

3832. Do you think that the angle should be calculated from the outer edge of the wick?—That is my impression.

3833. Would you take an oil lamp as a standard?—I would take an oil lamp as a standard.

3834. Why?—An oil lamp shows better than an electric light; in very clear weather electric lights show clearly, but there is no amount of refraction from the electric light, if you might use the term; they do not fulfil the conditions of a side-light as well as an oil lamp does. In hazy weather they become obscured very quickly.

3835. And you would take an ordinary lamp such as would pass the Board of Trade survey, I mean the improved survey?—Yes. I should certainly like to see the lamps very much improved in character, so that it would be a lamp that you could rely upon, and I am not in favour of anything that would stop further improvements in lamps. I would like to see a high standard below which you could not go; anything above that of course I should not mind.

3836. I suppose, as a matter of fact, with the screening of the electric light you have a finer angle than you would have with the other light?—I should think we would.

3837. On account of its being more powerful?—Yes, it cuts cleaner.

3838. Do you see any reason why the same conditions should not apply to the rule of road at sea by night as by day?—I do not just follow you.

3839. Well, in daylight of course you have got the hull of the ship, or the ship herself, to indicate her course; at night you have only got the lights. What I wanted rather to get your opinion upon was as to whether in the screening you want to get as near the condition of daylight as possible?—Those are my views entirely; that is, the masts in line in the day, and the lights in one at night.

3840. And to prevent the complication which you have described to us as so frequently arising under the new condition of things?—Precisely. There is just one explanation I would like to offer and that is, that it is not alone the ship that you are primarily dealing with that the screening of the lights becomes an object of danger and a condition of danger to, but you have a number of other ships on either side of you. A small alteration in your course, if your light shows across the bow, may make it visible to a second ship, and an alteration in your course to avoid that vessel may make it visible to two or three more, and vessels under various conditions, and it leads you into a very dangerous and difficult position with regard to the first ships you saw; what you did in dealing with those may have been perfectly right, and when you come to be dealing with several other vessels it alters the conditions and then the port or starboard helm may not do; it may then be "reverse full speed," and in dealing with that my reversing full speed may mislead these other ships again and place me in a position of danger with them.

3841. You want to avoid confusion?—I want to avoid confusion.

3842. In answer to Rear-Admiral Andoe you said you were in favour of the side-lights being placed abaft the masthead light?—Yes.

3843. For the reason that you got an earlier indication as to the movement of the ship?—Yes.

3844. Then what do you think of the side-lights being put into towers at the end of the forecastle deck?—I think it is the worst thing you can possibly do to put light towers on the forecastle deck.

3845. The after end, of course, you mean?—Well, the forecastle deck of most modern ships is before the foremast, and you then have your lights in a position forward, as a rule, of the masthead light.

3846. And that you do not approve of?—No, that is bad.

3847. Would you go so far as to prevent them being placed there?—I would if I could.

3848. You think it is a source of danger?—I do.

3849. And they are more likely to be intercepted by spray, or gear, or tackle?—It is a bad place for the lights to start with for working if you are in a fast ship. I have seen it in one of your own ships in the Atlantic. I have been three nights and we could not get our light to burn amidships in the vessel, and we never put a light on for three nights, simply because the force of the wind put them out as fast as they were lighted, and the only thing we could fall back upon was to keep them in the side house, and the masthead light in the forward steerage ready to pull up in case anything was seen.

3850. And that was a bridge which was high out of the water?—You recollect perhaps the occasion of [illegible] we lost [illegible] in the "Celtic," which took 14 days, when we lost half the bridge; and everything that would break, I think, did break; still we managed to get through; but upon that occasion what chance would you have of placing lamps on the forecastle head when the very rails were cut off.

*Capt. W. S. Wade.*

20 June 1895.

3851. You speak of Harvie's lamps; have they a good reputation?—With the exception of Chance, of Birmingham—the makers of the lighthouse apparatus—they are best I have ever seen.

3852. Are they largely used in the coasting trade?—We use no other, and all the better class of Channel boats use them.

3853. And you wish the Committee to understand that you are clearly of opinion that the finer screening is in the direction of greater safety, and would be acceptable to the mercantile marine?—The finer you screen the more safety you insure. That is our position, up to a certain point of course.

3854. That is, parallel to the keel?—Yes.

3855. (*Chairman.*) What do you consider would be the limits within which "nearly end on" would apply?—Well, "nearly end on" is a term in daylight, when you can just see daylight through the masts and funnel.

3856. You would not consider "nearly end on" to mean more than that?—No.

3857. Translated into points and degrees, what would that give you; supposing a vessel is 5° on the bow would that be nearly end-on, do you think, or 3° or 1°?—Well, I should say about half a point. About five degrees would be nearly end on, of course. I say it advisedly, because you must always take into consideration the conditions of the weather. If the weather were rough, and you were steering wildly, you would then take care that you were not going within more than a reasonable distance of a ship, that you would have plenty of room to manœuvre; but in fine weather, when the vessel is steering well, of course you could safely go closer, and in that case you would interpret it according to the condition of the weather.

3858. I mean as a matter of real practical steering, supposing you were steering by day, and you saw a vessel approaching, within what limit of degrees or points or quarters of points on your bow would you think it right to port; in what position do you think the rule that you are to port would apply?—I should say about 5°, about that; I have never taken the angle. I have not put a section pointer on the angle and taken it, because you must entirely use your own judgment upon the conditions under which you are working, and if you see whether you are going well clear of the ship, if you maintain the course or not, you act accordingly.

3859. (*Capt. Castle.*) I understand your evidence to come to this: If you are approaching another ship, and can see a green light a little on your starboard bow, you starboard a little to give her a wide berth; and when you are approaching each other, she with broad screening, and you get the glimpses of her red light, you port, and throw yourself right across the path of the other vessel?—Yes. You see at night it is no use a man saying he believes that ship is going clear. When you see a red light it is a red light, and you do not know whether it is coming exactly at you end on. You say if she is closely screened as in a foreign ship she is coming straight at you; if she is a British ship and has got squinting lights she will probably go clear.

3860. But you do not know that?—No, you cannot know that. You do not know how the vessel is screened, nor do you know how she is coming at you; therefore you must simply interpret it upon the rules; if it is red the regulations say you are meeting ships when you see the two lights, and you must port. You do it, and perhaps she has been starboarding, and it only closes them. On a clear night, when I have been in charge of the deck myself, I was very near a collision in an instance such as that, and had it not been that we both kept our helms hard over, and the other ship took a round turn, there certainly would have been a collision, and a very serious one.

3861. You had therefore to manœuvre?—Being close together with the red light open.

3862. (*Mr. Bolam.*) In one of your notes on page 4 of your evidence you say: "I have frequently met "steamers in the early morning, and on clear moon-"light nights, when I could see the vessels' hulls plainly, "and that they were heading in such a direction as "would go clear of us, but at the same time both "side-lights were plainly visible." Will you kindly say whether the date you were referring to is after the 4° Order in Council or before?—Yes, it refers to the period after the Order in Council.

3863. Then in the next paragraph you say: "Lamps "should be screened to the outer edge of the wick, and "be of uniform power." What do you mean by uniform power; do you mean that the lamps provided to all ships should be of equal candle power?—No, the paragraph is subject to be misunderstood. I think what I really meant to convey was that there ought to be a high standard of power, below which no lamps supplied to a ship ought to go. A ship might be supplied with lamps of a greater power.

3864. Will you kindly give me the names of the ships in your company which were screened so that the chocks came fore and aft of the outside edge of the wick. There were 12 of them, I think you said?—The "Dunbrody," the "Reginald," the "Lara," the "Commeragh," the "Ardnamult," the "Creaden," the "Vandeleur," the "Tintern," the "Shannon," the "Flying Huntsman," and the "Mermaid."

3865. You approach this question from what I will call the opposite extreme, that is to say, your wicks were as much cut off as they possibly can be when the chock comes to be outside?—To the outside edge, yes, I presume it would be so.

3866. And are you quite convinced in your own mind that even with the chock coming to be fore and aft with the outside of the wick you can see the full light of your lamp ahead of the lamp?—I think you see a light quite good enough for all practical purposes ahead of the light.

3867. But not necessarily the full light?—As I said before, I am not up in optics, and I could not say from a scientific point of view.

3868. Your own experiments were only carried out to 600 feet distant from the ship, and not beyond?—Yes, that satisfied me as to the correctness of the view that I held, that these lights were perfectly visible at that distance.

3869. At 600 feet?—Yes.

3870. In coming across from Waterford to the Bristol Channel you must often cross your own vessels going the other way. Have you often met your own vessels end on?—Frequently.

3871. And at what time?—Invariably at night.

3872. And both of you with your lights screened so that the chock came to the outside of the wick and you had no difficulty in avoiding a collision?—We never had the slightest difficulty, we could always see the two side-lights.

3873-4. So that, in your judgment as a shipmaster, safe navigation at sea is consistent with the chock coming fore and aft with the outside of the wick?—That is my view; and, in confirmation of that, if I might say so, it is in the channel that the great use of lights takes place; it is there that you get a number of vessels, and that is why a light wants to be closely screened. Because in dealing with these vessels many times you have to deal very closely with them. It is imperative, you cannot help yourself, you must pass them very close, and therefore, if your lights are not screened closely, they mislead and tend to danger.

3875. Do you place much dependence upon the rhyme, "Green to green, red to red, perfect safety, go ahead"?—I never thought there was perfect safety at sea. I believe in the man who said the sailor's life was an imprisonment for life, with the additional danger of being drowned.

3876. (*Mr. Scrutton.*) You have spoken in this paper of meeting several vessels; is it a common practice for you to meet three or four vessels sufficiently near that you have to deal with them *en bloc*?—Yes, it is a thing which occurs every passage, and not at one time on a passage, but it frequently occurs at five or six different periods of the passage.

3877. Could you explain a little more fully your views as to the source of danger when the light is at the end of the forecastle?—My view as to the placing of the side-light is that by bringing it abaft the masthead light so as to form——

3878. But that is not my question. My question is this. What is your objection to the lights being placed at the after end of the forecastle?—Well, if you assume that the forecastle comes to *there*, you have the masthead light on the mast *here*, and your side-light is *here*. If I might use the term, that is an

unnatural position for the side-lights. You look at that, and the first thing that strikes you is that vessel ought to be going the other way—that is the first thing, you think, as a seaman, but the light tells you she is not. You know the lights ought never to be placed in a position to cause distrust in a man's mind; it ought to assist his mind rather than cause distrust; and every seaman I have heard unhesitatingly condemns those lights placed before the foremast

3879. Then I suppose that you recognize that in a vast number of ships it is the common practice to place them with the lights in lighthouses, particularly in modern times?—Yes, I think I can give a very fair reason why that is done. Probably, a third of my time is spent in shipbuilding yards looking after new work and repairs that we are doing. I have noticed that the Board of Trade have entirely set their faces against lighthouses being placed amidships or anywhere amidships, to the extent of refusing to pass them (upon what ground I do not know) and that has necessitated this, that the builders invariably say, "Well, just let these " be put forward—it is a very good position, and there " will be no trouble with the Board of Trade," and by that means they bring a pressure upon the owners about putting them there. Many of these owners are not practical men or have not much experience of ships themselves and they accept it, as the Board of Trade say that is the position, and in fact they go further and say they will not pass them if they are put amidships.

3880. If you meet a vessel two miles off, can you tell by the look of her lights, do you think, whether they are on the forecastle or amidships?—It is entirely dependent upon the direction in which the vessel is going.

3881. Suppose she is meeting you?—That is the only position, when they are meeting, in which it is of least consequence where the lights are placed, but in any other position it is of the very greatest consequence; and there is further this, that as you draw towards one another, then you find the value of the angle between the masthead light and the side-lights; when it is amidships it immediately then shows the position whether it is one of safety or one in which you are going to pass too close.

3882. But if you are not meeting a vessel ahead then you will only see one light?—Precisely.

3883. In your evidence you say that the utmost precaution was taken that the side-lights should not be seen across the bow in the early days. What is your justification for making that statement?—My justification has been my own observation of it.

3884. Then do you mean by the owners in fitting or by the Board of Trade in passing?—In the first place the side-lights were fitted by the builders and the owners' surveyor or superintendent, whoever he happened to be, and they took care that these lights were properly placed.

3885. It was a matter which was before them very distinctly to avoid their being seen across the bows?—I can only speak for myself in dealing with those things. It has always been my care to see that those things are carefully looked after.

3886. Then, again, you say the Order in Council has so altered the language of the International Regulations that the words "shall not be seen across the bows," which every sailor knows to mean by other ships. Are you quite clear that a sailor in dealing with those words would say that does not refer to "my ship," but refers to what the other ships see—that is your explanation?—There can be no doubt about it; it is a term used by seamen, when a man speaks of a vessel crossing his bow he refers to something that has crossed his path ahead of the ship. He does not speak of the bow of his own ship. He reports everything as off his bow.

3887. You made use of the expression, "So as to be " visible from right ahead of the light." The regulation does not say "from right ahead of the light?" —it does not say of the ship either; it just says "right ahead." Of course, no doubt it is open to argument whether it means ship or lights, but it is our belief that that should be "right ahead of the light," and then you would get the lights converging ahead of the ship.

3888. (*Sir E. Harland.*) Referring to this matter of lighthouses and side lights being placed on the after part of the forecastle, do you think that it was with the object of keeping such lights clear of being blinded by the foretack, say, or canvas of the ship?—No. I do not, because in the majority of instances it applies to steamers; very few steamers nowadays have any square canvas at all, and if they have, the foot of their sail is amply high and above any lights, and it would be abaft such lights as those.

3889. Then do you think at the present time there are more steamers fitted with those lighthouses than steamers fitted amidships?—I do not; I think the other system of placing them amidships prevails.

3890. (*Mr. Ismay.*) In what proportion, 10 to 1?—Well, that is a very large proportion.

3891. Well, 6 to 1?—I dare say it would be 6 to 1.

3892. (*Sir E. Harland.*) Then so far as sailing ships are concerned, you do not think that where that is so it is with the object of keeping those lights from being blinded by the canvas?—Of course, that argument applies with more force to a sailing ship than to a steamer; but my view of it is this, from the actions I have seen of the Board of Trade inspectors themselves, that those lights are placed forward so that they should not be seen on the ship herself, for if the same lights were put amidships and screened to a 4° angle, they would both be visible on the forecastle deck of the ship itself; it is pretty well understood that this would take place and my own experience shows me that it does take place.

3893. Then how do you account for probably all the Transatlantic steamers having lights fitted amidships, or at the end of the captain's bridge well towards amidships?—I think that is right.

3894. But is not that a long way aft of the forecastle?—Yes, and it is in the very best part of the ship, and there are many reasons for having them there: in the first place, they are under the eye of the officer on the bridge and he can see whether they are burning dimly or whether they are alight, and can have them replaced, and they are clear of all the heavy water which comes forward. When those glasses get hot in a heavy sea they split at once.

3895. But if you say the lights are placed on the forecastle with the object of preventing their light being shed on the forecastle deck, would it not be more so if you had them placed at the ends of the captain's bridge?—They would shine on the ship more. But that is not our fault. We do not want it. We are compelled to do it.

3896. Is that another objection you have to coarse screening, that the coarser they are screened the more likely it is the light will be shed from the side-light on to the forecastle of a vessel, but where the lights are placed amidships that would not be so?—Well, that is rather a queer question to answer; in this way, that the light being placed amidships, it does not take away from its efficiency because you choose to throw it across the bow, to allow the light to shine on the forecastle deck. As I said before, that is not our duty. We cannot help it; we are made to do it. If we were allowed to screen the lights as prudence dictates, we would screen them in such a way that they would not interfere with the vision of the officer.

3897. You are in favour of placing the side-lights abaft the masthead light.

3898. Would you be disposed to recommend any particular angle relatively to the masthead light?—Well, I find in some of the cargo ships of the White Star and the Leyland line, where there is a very great drift between the masthead and the side-lights, it is very easy to distinguish how the ship is heading.

3899. Would you go so far as to make a regulation or a very strong recommendation that all ships should have their side-lights so placed?—I certainly would.

3900. In such a case would you then recommend each should be at a given angle relatively to the other?—Well, it is not always practicable to place a light within 6 or 8 or 10 feet of where you would like it; the conditions of the structure of a ship and the deck erections and the rigging come in so that what is possible in one is not possible in another; but in practice, and for all practical purposes, there would be no doubt that lights could be placed on ships in such a position as I say.

3901. Assuming that the side-lights were placed at an angle of 45° to the masthead light, would you be able to recognise pretty precisely in what direction the vessel was heading: if, for instance, you were

*Capt. W. S. Wade.*

20 June 1895.

going to cross her bows?—It would give you the best indication that lights can show under those conditions.

3902. If, for instance, the vessel is so placed that you would only see the masthead and port light, do you recommend that as the vessel approaches more nearly end on to you the angle between the port and the masthead light should gradually become less?—Precisely.

3903. And it is the difference between those angles which would enable you to form an opinion as to what course that vessel was steering?—Yes, you either lessen or increase the angle according to the direction in which the ship is going.

3904. And that is what you would be glad to see gradually adopted?—That is so.

3905–6. You referred to both the lights being visible at 96 feet ahead when screened parallel to the keel?—No. That has been since they were screened to the 4° angle.

3907. When screened to the 4° angle, do you think you saw anything of the light itself, what I may call the visibility of the wick; at 96 feet: or do you think it was the refracted rays from the lens?—Well, as I said before, I am not well up in optics, and really upon that point I could not say anything; only I saw her red and green light.

3908. Have your vessels what are called dioptric lenses?—Yes.

3909. You are not referring to the fish-globe plain lens?—No. Dioptric lenses, with the larger one in the centre.

3910. Are you in favour of that lens in preference to a fish-globe lens?—I have had no experience of what you term the fish-globe lens.

3911. It is perfectly plain?—Oh, no; they are no good.

3912. This is what is known as the fish-globe lens (*producing a lens*)?—Oh, no; we found that those lamps have not nearly the power of the dioptric.

3913. But would you say that was due to the lens, or the strength of the wick or the flame?—No, I think it a less powerful lens. The dioptric lens refracts the light so much better.

3914. And brings it more generally on the level of your vision?—Yes.

3915. You referred to some lamps in one of the transatlantic steamers having been blown out by the wind; is that an inherent defect in side-lights?—It is not. It was an exceptional circumstance. We had the worst weather I ever experienced at sea. We had a hurricane.

3916. Then the smallest crevice would let it through?—We stuffed them with waste, and we put canvas covers on. We did everything that a sailor could, and if anybody could think of anything more than a sailor can at sea he can go and do it.

3917. It was under very exceptional circumstances then?—Yes, you see you can stuff a light up so that it would not burn for want of air, and you have to leave a certain amount for ventilation.

3918. And it was probably through the apertures which supply the fresh air and let the foul air escape that the wind put out the light?—Yes, these were the best lights, trimmed in the best way, placed in the best way, and everything of the best, and everything was done that could be done.

3919. The Chairman asked your opinion as to screening from the outside of the wick. Now *here* is a plan of an ordinary lamp, and the wick *here* stands athwartships; do you really mean that you are in favour of the chock projecting so far from the face of the screen as to reach out to the outer edge of the wick, assuming, of course, that the screen is parallel to the keel?—Yes, certainly.

3920. Then I think you replied that directly ahead of the lamp you were still able to see the full strength of the flame?—I could see both lights clearly.

3921. (*Rear-Admiral Andoe.*) At 600 feet?—At 600 feet.

3922. That is a very short distance?—It is not far.

3923. (*Sir E. Harland.*) You referred to the steering of the "Celtic"; are you aware that the "Adriatic" and the "Celtic," which are, perhaps, sister ships, are probably the longest ships afloat for their beam?—Yes, I am aware of that.

3924. With reference to their steadiness in steering?—Yes, I did not couple the two things together.

3925. But of course it is well known to seamen that narrow long ships steer better than broad short ships?—Yes.

3926. That is, steer steadily?—Yes.

3927. (*Captain Castle.*) And not being overladen has a great deal to do with steering also?—Yes, no doubt that has a good deal to do with it.

*Mr. D. Tamlin.*

Mr. DAVID TAMLIN called and examined.

3928. (*Chairman.*) I think you are a Swansea pilot?—That is so—Swansea and the Channel.

3929. Do you belong to the Pilots' Association?—Yes; I am a member of the executive.

3930. Is that an association of Swansea pilots or Bristol Channel pilots?—No, the United Kingdom Pilots' Association. We have an association round the coast embracing the whole of the United Kingdom. Our head office is at Bristol. We hold our conference on the 26th and 27th of next month at Cardiff. It is moveable every year.

3931. Are the views you are going to express your own views, or are they those of some body which has deputed you to express their views?—No, they are my own views, but we have talked the matter over in our boat at sea and in the pilotage office.

3932. What do you say as to this rule of screening to 4°?—Do you approve it, or not?—I approve it very much.

3933. Before the rule came into force, what was your experience as to what the actual screening of vessels was?—Well, I may say that we understood very little about it, speaking generally. My opinion was that dealing with the 10 points from right ahead (that is two points abaft the beam, and eight points, which make the 10 points), I always understood within my own mind that it meant right ahead of the ship, consequently there has never been any dark lane. That is my experience of it. The doubts are whether it was intended to be right ahead of the stern, or right ahead of the side of the ship, but I never had that idea.

3934. You understood the rule to mean that the full light should be seen right ahead of the ship, that is to say, right ahead of the stem of the ship?—Undoubtedly ahead of the stem. Right ahead of the ship is right ahead of the ship, from the stem head—not from the side of the ship. It has proved itself to be right in my experience.

3935. Then what would you understand to be the meaning of the rule as to the distance right ahead of the ship at which both lights should be seen?—Prior to the present rule?

3936. I am really asking you for the moment as to your understanding of the meaning of the rule. You were saying you understood the rule to mean not right ahead of the lamp, but right ahead of the stem of the ship. I want to ask you at what distance you place that—is it at the stem itself?—No, certainly not.

3937. Then at what distance?—I could not give you the distance. I was awfully astonished when I came to read the reports of the surveyors. It was given in answer by the President of the Board of Trade, where he says that prior to the adoption of the 4° angle—there were some, I think, from the various large ports—40 or 50 per cent. of the ships were really more than 4°—such as 6° or 7° or 8°. Consequently those vessels were certainly angled at a dangerous angle. Therefore, where there was no standard I could not possibly say the distance ahead that we could see the light. There was no standard really.

3938. That is not quite what I was asking you. You have said your view was that the words "right ahead" meant right ahead of the stem, and not right ahead of

the lamp. I wanted to know whether you understood the rule to mean right ahead of the stem at the stem, or right ahead of the stem at some distance from it?—Undoubtedly, at some distance.

3939. Have you considered at what distance from the stem the rule meant?—No.

3940. I am not sure whether you quite answered my previous question. Before the rule came into force, if you had any practical experience, what was the angle of screening that was usually employed in your judgment, apart from what you may have heard—vessels you have had to do with yourself?—Well, I should think about 5° or 6°.

3941. You think they were screened over 4°?—Yes. I have been in command of a vessel myself before becoming a pilot, and I recollect the time the new side-lights came out; the size of the lamps was increased; they had to go through that ordeal, and were fitted up afresh; and when the Board of Trade surveyor set them up I took particular notice, and I should fancy the angle given across the bow was somewhere about 5° or 6°.

3942. How long have you been a pilot?—23 years in the pilotage service.

3943. At Swansea?—At Swansea.

3944. Have you commanded a vessel or been on one before?—I was in charge before coming as a pilot.

3945. When this rule came out in 1892 you were then a pilot?—Yes.

3946. So I do not follow about your having been in vessels and seen the chock altered for the purpose of altering the screen. Would that be 23 years ago?—Oh, fully; 24 years ago. Of course there was no scale laid down then.

3947. Would you tell me why it is that you think the 4° is a good limit for screening?—Well, I consider it a very safe angle, for the purpose of navigating in narrow waters particularly.

3948. Then in narrow waters you approve of what you call crossing lights?—Certainly, you are bound to have them. You call them crossing lights, but I cannot see that they are crossing lights, only to a certain extent.

3949. Then is it your judgment that lights that do not cross in narrow waters are less safe than lights that do cross?—They are dangerous, undoubtedly, in narrow waters for many reasons.

3950. Of course you are aware that that is contrary to the opinion of a great many people?—I cannot help it.

3951. But you are saying that knowing it is contrary to the opinion of a great many people?—Oh, yes.

3952. But it is your deliberate view that, in narrow waters especially, crossing lights to the extent of 4° are safer than lights that do not cross?—Undoubtedly they are, in narrow waters. I might say that vessels then are solely in charge of pilots, so the question is really a pilotage matter, because in narrow waters we steer our vessels very accurately; we have no room to deviate, therefore we pay particular attention to the course we are steering. Of course, in ocean steering you do not steer within a quarter of a point one way or the other, there is plenty of room there; but in narrow waters you would pay particular attention. Sometimes they are as close as 2°. Therefore, I say in narrow waters the 4° angle is the safest angle.

3953. But even in narrow waters you would like to know how the vessel was approaching, and you know that you would see all three lights of a vessel although she was 4° on your starboard bow?—Oh, quite so.

3954. Then you think the rule of porting ought to apply equally in narrow waters?—If necessary. You have to depend upon whether the river is clear. In coming into harbours we cannot always depend upon the porting business.

3955. Tell me why it is you think that 4° in narrow waters especially is a safer thing than 2° or any other angle. Why do you desire that the lights should to a certain extent cross more than they need?—If it is 2° the distance at which they would converge would be too great, consequently it would produce a dark lane, which we cannot afford to have in narrow waters.

3956. Then your idea is that if 2° is adopted there would be a dark lane ahead of the vessel?—To a certain extent, where the lights would converge to a 2° angle: that would be too much for narrow waters.

3957. You mean by the dark lane, I suppose, the space in which neither of the lights would be seen?—Yes.

3958. Have you any idea in your own mind what distance that dark lane is actually in length when the lights are screened to 2°?—I should think about 14 times the breadth of the ship.

3959. That is the impression you have in your mind?—Yes. I have drawn up the account in my own way.

3960. What in your judgment would it be at 4°?—7 or 7½ times the breadth of the ship, I think. It ought to be that, I should think.

3961. And you think it is important that the dark lane should only be seven breadths of the ship and not 14 breadths?—Undoubtedly, more especially for narrow waters. If we had it shorter it would throw the light across the bows.

3962. Is there any other ground which you would like to put forward as a reason why you think 4° is a better and safer thing than, say for comparison, 2°?—No, I cannot see that there is any, but I should like to know if you could possibly determine what would be safer than 4°. If any person can tell me I would willingly adopt it.

3963. I am suggesting a comparison between 4° and 2°. Do you think 4° would be safer and better than 2°?—Oh, undoubtedly.

3964. You have given me one reason, the dark lane—which I fully appreciate—is there any other reason why you say 4° is safer than 2°, for example?—No, I do not see anything at present more than that 4° would be a safe angle because the lights would converge at a reasonable distance ahead of the ship, and I think the faint tinge of the light after the divergence would be very trifling outside on either side; it would be a matter of no importance in my opinion.

3965. I do not know if you are at all aware of the distance on each side of the centre line to which the lights actually show when they are screened at 4°, at a mile or two miles from the ship?—Nothing of the sort would run a mile.

3966. Is it your impression that at a mile from the light that would be so?—No, it is my impression that it is considerably less than that distance where the convergence takes place from the ship.

3967. I am not quite sure whether I make myself clear. At a distance of a mile from the ship, have you formed any impression what distance on each side of the middle line the green and the red light are seen if screened at 4°. (*Describing on the plan*)?—That would be a very faint light; it would be, as we say, the starboard light crossing the bows. The convergence is *here*. I should think it would not be a quarter of a cable's length before you would lose it altogether, not more than that, if you were approaching him. You would very soon come up and have the light in view, so that you would be able to decide what you were about to do.

3968. If that is about 150 feet, screening to 2° would be something less than that of course?—If screened to a 2° angle, quite so.

3969. What I wanted to ascertain was, whether you attach any practical value to the lights not crossing to that extent. Do you think this distance would be less when the lights are screened to 2°?—No, I could not see any difference at all, but I consider that 4° is the proper angle, unless someone has something better, and more especially in narrow waters. Of course what we say is this (there has been some controversy about it), 10 points of the compass are 112°, that is from right abead; but I always understood that 10 points of the compass to come in and meet in the centre of the vessel. The only difference I see between the old regulation and the new was that the words "of the ship" were added. I always considered that it meant right ahead of the ship.

3970. May I take a mile as the distance; if the full power of the light were seen right ahead of the ship at the distance of a mile, would that satisfy the rule?—I should say so, amply; there would be ample time to do anything in that case.

3971. As long as you see the full light right ahead of the stem of the ship a mile distant, that in your judgment would be sufficient?—Yes, or even less; but as I say in narrow waters we will not allow a vessel to yaw about, consequently we want to

*Mr. D. Tamlin.*

20 June 1895.

pick up one light; if a vessel yaws about certainly we can see both lights when coming end on; but when a vessel is in charge of a pilot we steer very closely; we pay particular attention to the helm because we have no room to deviate; if I deviate a quarter of a point I am ashore in our channel, which is only 250 feet.

3972. Does that express generally the view you wish to put before us with regard to the rule, or is there anything else you wish to say with regard to the 1892 rule?—Nothing. I do not see that I have anything to say upon the subject, more than that we heartily approve of the 4° unless somebody shows us something different and I cannot see anything safer or better than the 4° especially in our business; you might get no degrees at all at sea where a vessel has a chance to yaw about, but working in narrow waters it is most important that it should be 4°. I think that would meet all purposes. If you give a greater angle the light will show across the bows, and if you give it less it will shove me perhaps in the dark lane, and I shall have nothing but the dark lane because steamships are very broad; the common colliers are 40 and 45 feet beam nowadays; that is quite common.

3973. (*Rear Admiral Andoe.*) Your object you say is to continue a straight course in steering up the narrow channels, is it not?—That is it.

3974. Not to have to go zig-zagging about?—That is it; that is the business of the pilots.

3975. And you think that by screening a light to 4° rather than to a finer angle enables you to obtain that object?—That is so.

3976. Supposing you are going through a narrow channel and you see a vessel half a point or thereabouts on your starboard bow coming down showing you both lights, what would your duty be?—If distance would permit, to port.

3977. And cross her bows?—Yes, show her my red.

3978. Supposing the lights were screened so as to throw a light right ahead of the ship—by ahead I mean what you mean, some distance ahead—and so as to reduce the angle, then you would not see both lights?—No.

3979. But only the green light?—That is all.

3980. And consequently you would be enabled to continue your course along the channel without crossing one another's bows; do you see that?—No, I do not.

3981. Would you mind looking at these models. Supposing *those* vessels were approaching one another each having the other about half a point on the starboard bow; if you are screened to 4°, which is nearly half a point allowing a degree of yaw, you would each see the other's two lights?—You would.

3982. And according to the law you would port your helm, and go clear of one another?—Yes.

3983. Supposing you were screened finer and you are still bearing half a point on the bow of the other, and supposing your light is screened so as to come right ahead of the ship like *that*, and converge at a considerable distance, and yet not leave a dark lane altogether, if that was the case, you would not see other's port lights but only the green light, and consequently, you would continue your course like *that*, would you not (*describing*)?—Probably that might be the case.

3984. Keeping away a little bit to give more room?—Yes.

3985. So that in that case the finer screening would enable you to keep a straighter course than coarse screening?—Yes, but the question arises very much then whether I should have room in a narrow channel to give him a broader berth.

3986. If you had coarse screening you would have to alter your course more to get across?—Not necessarily, because it is laid down, and every man would know what the uniform angle would be; he is accustomed to it and he would know the distance he was off from the other by general practice.

3987. You mean to say that even though you saw the two lights you would not cross the bow?—Just so.

3988. Therefore, you would not obey the rule of the road?—Oh, you must not do that.

3989. Therefore, if one did, and another did not, and you came into collision you would be found in fault for not doing it?—Most undoubtedly.

3990. Therefore, if you had fine screening, and did not see the two lights, you would simply continue your courses and pass one another on the side you found yourself originally without crossing one another's bows; you might do that?—It would be possible.

3991. Because there would be no reason for crossing the bow?—Yes, but it is not necessary; the ship is end on, or nearly so.

3992. Half a point?—Well, even half a point I would port if I was far enough off, giving him time to port also.

3993. If you did not see the two lights, supposing you only saw the green light of that vessel, would you port across her bow?—It depends upon the distance he is away from me, and the angle he is upon. You can always tell pretty well the angle a vessel is upon.

3994. But half a point angle?—Well, that is the angle she is off my starboard bow—half a point.

3995. And you only see the green light?—Yes.

3996. Do you think you would port your helm in that case to cross his bows?—Well, if he was a mile away, and I wanted to put myself in the channel ——

3997. But I am speaking of merely clearing this vessel. I mean in an ordinary channel, where you are passing each other?—I would myself go up on the starboard side of him.

3998. Would you be justified for purposes other than pilotage in crossing her bows if you only see her green light?—Yes.

3999. If you did not want to do it for pilotage purposes, but merely wished to clear the vessel, you would not do it?—Of course, I would port the helm and open out his port light, bringing him perhaps a point and a half on my port bow.

4000. But you would not do that unless you had pilotage reasons for doing it?—The reason simply is that I want to cross his bows.

4001. And to satisfy your own fancy?—To satisfy my own fancy. If he is a certain way off half a point is not much. If he was a quarter of a mile off me, I would say port and and show my red; if he was three-quarters of a mile and I ported a point or a point and a half, I would very soon open his port light.

4002. But you would not break the law if you kept green to green?—No, certainly not.

4003. (*Mr. Ismay.*) Do I understand you were in command of a steamer before you joined the pilotage service?—No, a sailing vessel.

4004. Then you have never been in command of a steamer?—No.

4005. Where was this sailing vessel trading to?—To the west of Ireland; it belonged to the Berehaven Mining Company.

4006. You never had any ocean experience?—Yes, I made six voyages to the west coast of South America in different capacities; as second mate.

4007. That was the highest position you got, second mate?—I was a master in the home trade and served in all sized ships up to the "Great Eastern."

4008. How long have you been in the pilotage service?—23 years.

4009. And 4° you say is a safe angle to screen at?—It is what I consider a safe angle.

4010. Is that screening from the outer edge of the wick or the inner?—The outer edge I should think; yes, the outside edge of the wick.

4011. Are you quite sure about that?—Yes.

4012. Have you tried it at all?—No, only common sense. I have put it on paper several times, and had a bit of controversy at the Chamber of Commerce some time ago at Swansea, and I fully explained it to the members, and there were some nautical gentlemen present; they quite confirmed what I said.

4013. You have given some thought to that matter?—Yes, I have fully thought it out and weighed the matter in my mind.

4014. Has no one attempted to show you that they could screen to a finer angle and be safer?—No.

4015. If they could you would adopt it?—Yes, if it was proved to me to be better than 4°.

4016. You seem to lay great stress upon 4° being safer in the narrow waters. Where are the narrow waters that you have spoken of?—All over the United Kingdom pretty well.

4017. But what is your pilotage ground?—From Nash point to 4 miles west of the Elvick lightship.

4018. As Rear Admiral Andoe put it to you, you would port your helm, even although you saw a ship's green light?—Yes, if I wanted to get the other side of him providing I was at a safe distance from him.

4019. Suppose that the vessels are so far apart (*describing*) would that not tend to considerable confusion?—I should take that into consideration.

4020. But in taking action you have regard to what others may judge of your action, have you not?—Yes, we have to do it in narrow waters and in entering dock; in fact, we are bound to do it in entering the harbour. There is the Prince of Wales Dock. Ships coming down the channel come down under a steady helm and we are bound to keep on the port hand.

4021. That is for pilotage reasons?—Yes.

4022. Have you ever gone on the stem head of a steamer to see whether you could see the light?—Yes, cruising round them.

4023. But on the stem head of a steamer of which you are pilot?—Not for the purpose of looking at the lights.

4024. You do not know whether or not you can see the lights from the stem head?—You ought not to.

4025. And if you did not see them, it would be a source of danger?—Undoubtedly it would be, from the stem head.

4026. (*Captain Castle.*) Your pilotage extends principally I think from the Mumbles to the dock?—The pilotage district is from Nash point to Elwick lightship.

4027. But you generally pick vessels up in the neighbourhood of the Mumbles?—Yes, and lower than that.

4028. You are never going at a high rate of speed—it is only a very short distance?—Not particularly, but I have been under a great rate of speed myself. I go to Liverpool to fetch round the West Indian Pacific Boats; they are long boats and steam quite 12 or 13 knots.

4029. Do you come round as a pilot in charge of them?—Yes, I have done that four times lately.

4030. But you are not licensed for that?—No, I am the local man to assist the captain.

4031. It is not compulsory?—No.

4032. Going into dock you are not going at a great rate of speed?—No.

4033. Going very slowly?—Four knots at the entrance of the Channel, and when you get up to the Bar you reduce the speed.

4034. That is after you get inside the Heads?—Yes, but when we cruise 40 miles west of Lundy, of course we have to drive at a good speed.

4035. But there is no risk of collision in the ordinary course of docking a ship?—There is a collision occasionally.

4036. But not ordinarily; it would not depend upon how the lights were placed. I am speaking of going into the docks after getting round the Heads?—Oh, certainly, you want side-lights.

4037. I say the screening does not come in then much?—Oh, yes, it would come in there a great deal, as other vessels are entering and leaving simultaneously.

4038. I am speaking of Swansea. You seldom or ever meet vessels coming out of dock the same time you are going in?—Oh, yes, there are three docks on the river, and they empty themselves simultaneously when you are entering. There are always ships going in and out.

4039. You are placed in the centre, with a dock each side of you; one dock on the right and another on the left?—Yes; all sorts of ships are moving about the harbour. Vessels leave simultaneously.

4040. Do you meet ships at night time?—Yes, right up to the entrance of the dock-heads. We could not get along with our work if that were not so, so we have narrow water in navigating.

4041. (*Mr. Bolam.*) Have you seen the Board of Trade statistics as to the angle of screening of vessels in the South Wales district?—Not particularly South Wales. I have seen those relating to Barry and Cardiff.

4042. Have you seen the chief surveyor in the South Wales district, Captain Chalmers?—I do not know him.

4043. And you do not know, therefore, that he has prepared a table which shows, if it can be trusted, that the angle of screening in that district has been enormously large hitherto, before the 4° instruction?—I do not know whether it is from him or whom. It was given in a reply by the President of the Board of Trade some three or four months ago.

4044. And it is your belief that the angle in that district formerly was more than 4°?—Yes, evidently, if the report is correct.

4045. And you have that in your mind when you are giving evidence?—Yes.

4046. Then in your view what the Board of Trade have done is to very considerably diminish the angle of screening by the 4° instruction?—Yes, to a safer angle.

4047. And do you think that that reduction was in the right direction?—Undoubtedly.

4048. It is only a question of argument as to whether they have reduced it sufficiently. You think they have?—Yes.

4049. It is that dark lane which you are in dread of?—Yes.

4050. You have also said, "We want to pick up the one light." Why do you want the angle at which you can see two lights across the bow made larger than necessary if you want to pick up the one light?—What I said was this, that where the lights converge, the faint glimmer that would show beyond would be very small, and you would very readily pick up one light if you were going towards the other ship.

4051. When you see another vessel in very narrow waters, when do you know you are passing safely—when you see both lights or one?—When I see one shut out.

4052. Why then should you prolong unnecessarily the time during which you have two?—It depends upon the distance that the ship is from me. If at no great distance, of course, I should have to be very prompt in shutting off one light; but if the ship is a long way off me, I am indifferent about it.

4053. Then, if you are in a narrow channel, and you have to shut off the light by turning your own ship a considerable number of degrees, there is just a chance as the water shallows of your smelling the ground?—Yes.

4054. And your vessel may take command of herself and turn right round, right in the centre of the stream, and get into collision?—Possibly so.

4055. Then is it not desirable in narrow channels that you should alter you own ship's helm as little as possible in order to ensure the safety of the property you are in charge of?—Certainly, in narrow channels.

4056. Then your view is consistent with the angle of side-lights being as small as possible?—Precisely.

4057. (*Sir E. Harland.*) Reference was made just now to the dark lane; have you ever when you were coming into port at close quarters with ships meeting you found yourself in the dark lane?—Never. I have found no dark lane.

4058. I presume you are including in that answer the period which has elapsed since the screening was limited to 4°?—Yes.

4059. Then if you have never yet discovered the dark lane, have you any reason to suppose that if the screening were finer than 4° you would come into the dark lane?—Yes.

4060. Have you ever tried the experiment yourself?—Yes, and extended it.

4061. Then at what angle would you say there was such a thing as a dark lane; you say there was no dark lane at 4°?—Oh, yes, there is a dark lane at 4° certainly.

4062. Then how near the ship must you approach before you actually find yourself within the dark lane

*Mr. D. Tamlin.*

20 June 1895.

with a 4° screening?—About seven to eight times the breadth of the vessel. That is how I worked it out.

4063. But did you work it out by actual observation, or only drawing it on paper?—Drawing it on paper, and I measured it myself.

4064. Then you have not tried it by approaching nearer and nearer until you found at last you were within the dark lane with a 4° screening?—No, if I drafted the like of that out, I would, of course, bring my experience to bear upon it in the position I was in, if I were afloat.

4065. But afloat you have not tried it?—No, I have not, for that purpose.

4066. Then from your experience afloat have you any reason to believe you would find a dark lane approaching a vessel ever so close with a 4° screening?—Yes.

4067. But you have only supposed it, you have not experienced it?—Well, I naturally expect it.

4068. But expectation and realisation are two very different things?—Yes, I do not suppose I have ever realised such a thing, because we should be getting so close, we should shut off one light before we got there.

4069. Therefore you think that with 4° screening as you approach the vessel you would get within the dark lane?—No, there would be time to shut off one light. The only way to do that experiment would be to get a small boat ahead of the ship, and that I have not tried yet. We go mighty close across the bows in our pilot boats—a great deal too close for some of them.

4070. And yet in crossing the bows of the ship mighty close you have not experienced the dark lane with the 4° screening?—No, I should want a small boat for that.

4071. What distance ahead are you contemplating when you speak of having a small boat in order to discover whether there would really be a dark lane or not?—Well, if she was on a very steady helm I suppose it would be about six or seven times the breadth of the vessel.

4072. Then, if you were nearer than five or six times the breadth of the vessel to the stem of the ship, you think then you certainly would find yourself in a dark lane?—I think so, if he was on a very steady helm.

4073. But you have not actually experimented in that way?—No, I question if I shall if I can avoid it.

---

## Wednesday, 26th June 1895.

PRESENT:

THE RIGHT HON. SIR FRANCIS H. JEUNE IN THE CHAIR.

Rear-Admiral ANDOE.
Sir EDWARD HARLAND.
Captain HALLETT.
Captain CASTLE.
Mr. BOLAM.
Mr. SCRUTTON.

Mr. C. HIPWOOD, *Secretary*.

*Capt. W. Chapman.*

26 June 1895.

Captain WALTER CHAPMAN called and examined.

4074. (*Chairman.*) What office do you hold?—Superintendent of the Royal Mail Company, Southampton.

4075. I think you have held that office since 1890?—Yes.

4076. You first went to sea I think in Mr. Green's ships in 1862?—Yes.

4077. Then you joined the Royal Mail Steam Packet Company in 1867?—Yes.

4078. And you obtained the command of one of the ships of that company in the year 1879?—Yes.

4079. Now, we want to ask your opinion about this present rule of the Board of Trade, which directs that the lights should be screened to an angle of 4°; what do you say as to that?—Well, I think it is wrong.

4080. Will you kindly give us your reasons, in your own way, why you think so?—Because ships first seeing each other's side-lights, not the masthead-lights so particularly, at comparatively short distances, nearly end on, but on slightly different courses, can see the wrong lights of each other, and be led to take action under different rules.

4081. To take action under different rules; will you just explain that?—One can see the other's lights as an end-on ship and the other can only see one light of the other ship.

4082. So that you mean, if two ships are approaching one another, the one that has the other on her starboard bow can see both lights, and the other can only see one; and you think would be a position of danger?—Yes; they would be led one to port and the other to starboard, which would bring about a dangerous position.

4083. That of course assumes that the two lights are not screened in the same way?—No, I think if the lights are both screened to 4° you could see it.

4084. That is just what I want to understand. Assuming the ships both to have their lights screened to 4°, I am not quite sure that I follow how you suggest it would come about that one might see one light and the other two?—If a ship is, say, slightly on the starboard bow—within a quarter or half a point on the starboard bow—almost ahead of another, she can be in both rays of the first ship's light, but at the same time she can be showing only her own starboard light. I do not think there is so much danger arising on clear nights, when the ships would see each other at a distance, as when in, say, comparatively thick weather one of the ships sees another's side-lights half a mile off, having first of all seen the masthead-light. Unless the officer of the watch keeps his eyes intently on the light until one runs across the ray of the other light, he puts his helm to port when the other man is putting his to starboard, and then you get them very close together. It is a very difficult thing to explain unless you have the lines drawn right straight. It is quite possible, if you had the angles directly drawn, for A to see only the starboard light of B, while B sees the three lights of A.

4085. Could not you have it as much over as *that*?—No, because if you had it as much over as that, you are approaching a position of safety with regard to *this* ship which is well on the bow—almost end on. *This* ship only requires to be a little off the line of course of *that* one. There are two or three positions which you can draw up on paper which would bring about the same result.

4086. Which will give you the result of one ship seeing the two lights, and the other ship seeing only the one?—Just so, and they will both put their helms the wrong way, or rather they will both meet; whereas they are both in perfect safety before they start.

4087. (*Mr. Bolam.*) Do you mean with a small degree of angle or a large degree when you say that they are both in safety before-hand?—I mean they would be both in safety if the lights were not thrown across the bow. They are in safety actually in daytime.

4088. And would be in safety at night if the angle of screening were small?—Yes.

4089. (*Chairman.*) You suggest that this danger only occurs with coarse screening, but is avoided if the ships are screened finely?—Yes, because the angle of the crossing of the light is so small.

4090. Now the suggestion made, and it has been made a great many times to us here, as a reason for the broader screening is, that if you do not have the broader screening there may be positions where each ship would only see the green of the other, and where, nevertheless, if their courses were exactly prolonged they would, or at any rate their yard arms would, come into collision?—No; that is impossible, unless they are very very close together, like *that*. You mean, of course, under the present screening.

4091. Yes?—Well, that is impossible, unless they are so close together that collision is inevitable.

4092. What is suggested is that if two vessels are green to green, each fine on the other's starboard bow, that they ought to be under those circumstances in a position of perfect safety; but it is said that if the lights are screened fine, although each ship only sees the green of the other, still they are not in a position of perfect safety, because if their two courses are exactly prolonged, both coming along in exactly the same way, the two vessels will meet *there*?—Yes, but they are not on railway lines; and in practice, I think, if *this* ship sees a green light practically right ahead, and it continues right ahead without altering its bearing a degree, then she would starboard. But that also, I think, is an exaggeration. If the light is screened from the inside of the wick right ahead (and you would not have it screened finer than that), the lights would then cross, if the lamps are about 10 feet apart, about 95 feet ahead of the ship. You may say that it reduces the angle as at present screened by about one-third; so that it would be impossible. There is no darkness at all; the light crosses at two-thirds the present distance. Then, furthermore, if the ships are coming close together like *that*, the glare that is in the lamps, which can be seen for half a mile without seeing the wick at all, crosses at 28 feet with lamps 10 feet apart, so that it is impossible that that could happen.

4093. (*Mr Bolam.*) Have you tested that by experiment?—Yes.

4094. You are not speaking from theory at all?—No, I am speaking from experiments I have made.

4095. With what kind of lamps?—Paraffin oil lamps; Harvie's lamps—our latest lamps on the last new ships.

4096. (*Chairman.*) Now, you spoke of screening from the inner edge of the wick; is that a rule of screening that you think would be satisfactory?—I think that is the best. I would screen them as fine as I could, but I do not think it would do to go finer than the inner edge.

4097. Perhaps it is only a question of the form of the rule; but as a matter of practice—as a practical matter—do you think it would be better to make the rule in this form: saying that it should be screened to the inner edge of the wick, or that it should be screened to a certain number of degrees from the outer edge of the wick, or the middle?—No. I would take it from the inner edge of the wick altogether.

4098. That, of course, gives you a very simple rule?—That is the clearest.

4099. Now can you tell me at all, before this new rule comes into force, what was, in your experience, the sort of angle to which ships' lights were usually screened?—Well, I was at sea then, and I really did not go much into this question, but I always thought that they were screened from the inside edge of the wick.

4100. You say you were at sea; were you in command of a vessel?—Yes.

4101. One of the Royal Mail ships?—Yes.

4102. How were your lights screened?—I think they were screened from the inside of the wick right ahead.

4103. I dare say you have experience of the opinions of other persons besides yourself. Do you think the general feeling of persons of experience like yourself would be satisfied with the rule of screening to the inner edge of the wick, as far as you know?—I think so.

4104. (*Rear-Admiral Andoe.*) Then you think that the rule as it was before the 4° angle was spoken of was really a very good rule to go by, if it had been properly carried out?—Yes, I think that is a practical rule.

4105. I do not quite understand you when you say that supposing two ships were screened exactly alike, and were approaching one another on parallel lines, each half a point on the other's bow, one would see two lights and the other only see one?—I did not say parallel lines. One ship must be slightly off the opposite direction to the other.

4106. Then you did not mean on parallel lines?—No; but on parallel lines, if one is a large ship and the other a small ship, with different distances between the lights, they can do it.

4107. If the screens are set at the same angle?—Yes, if the screens are set at the same angle, and there is a different distance between the lights; but then that distance is very small.

4108. Yes, it is hardly appreciable, I should think; but the contention of the Board of Trade is that if they are screened at 4°, both the ships, when they are approaching one another, almost ahead of each other, will see each other's two lights sufficiently soon to put their helms to port and to pass clear of one another. That is the idea: what is your view of that?—Well, I think in fine weather it is practically immaterial; but——

4109. One moment, I was going to put this to you. You see, in that case, by putting their helms to port, they would cross one another's bows, so to speak. By daylight we should not do that at sea, as a rule, should we? If you saw a vessel on your starboard bow half a point you would not cross her bow by porting your helm, but you would pass her on the side on which you find her?—Yes, because each of you would have your two masts open.
